much towards making the beneficial properties of milk available for the mass of the people. Ice cream is coming less and less all the time to be looked upon simply as a dessert—a pleasant ice with which to finish a meal,

Mississippi Convention Group.

but pasteurization, condensing, and refrigeration, which are all component parts of the manufacture of ice cream, preserve for the consumer all the beneficial properties of milk, and present these foods in a most palatable form.

* * *

EVERY DAY PROBLEMS.

By D. S. Cox.

The conditions I have experienced in my business are doubtless, in a large measure the same as those experienced by all ice cream men, and in the beginning, I might say perhaps a great many troubles in business are largely due to our individual temperaments. When

I go to my office in the morning, I know during the natural run of events there will come up matters of annoyance. Knowing this why should I worry? If I do, I place myself at a disadvantage because neither you or I can possibly be mentally alert, if we permit ourselves to worry. Knowing these things, I contend most of us would live longer and be happier if we will get the viewpoint that most of our troubles emanate from ourselves. Perhaps a little more philosophy on the part of each of us would work wonders in this connection.

* * *

CO-OPERATION BETWEEN MANUFACTURERS AND DEALERS IN SERVING THE PUBLIC.

By A. A. McLeran.

First: Let me ask you what is co-operation? Co-operation is a mutual effort to win success for all or both parties concerned. Co-operation, I think, is essential to the success of any business. We all remember some ten years ago, when every ice cream manufacturer thought his competitor a cut-throat and everyone trying to see what he could do to beat the other fellow. About that time, Mr. Henry Dutlinger of the Lily Ice Cream Company, Memphis, saw the handwriting on the wall, and, with the help of a few manufacturers in Mississippi, Arkansas and Tennessee, organized the Tri-State Ice Cream Manufacturers' Association.

At that meeting, we got together and told what fools we had been, and, found out that we could depend on each other for a little co-operation, if we would only try.

So we did. What was the outcome? We got acquainted with each other and found we were nearly all about the same sort of folks, just trying to do business and get a fair profit, so we went home, stopped fighting each other and began asking a better price for our product and made a little profit.

* * *

CO-OPERATION BETWEEN STATE AND SOUTHERN ASSOCIATION.

J. W. Clopton, Secretary Southern Association.

The Southern association is simply a clearing house through which the different state associations may handle matters that cannot be taken care of through the state association.

In order to secure desired results it is absolutely essential that the Southern association co-operate to the fullest extent with the state associations affiliated with it. Since co-operation cannot be successfully practiced by one party it is just as essential that each state association give the same degree of co-operation to the Southern.

In touch as we are with conditions throughout the entire South we are prepared to advise and assist in many matters that may need attention in any of the Southern states and what is good for one state is usually good for her sister state.

The Southern association retains membership in the National and is in position to secure correct data on matters of national importance on short notice. It is very often the case that prestige can be brought to bear in emergency matters from outside the state more easily than it can from inside the state, especially since we have data as to the laws and regulations of adjoining states.

Your Best Ice Cream Salesman

The best salesman of your ice cream is its flavor.

Considered from this angle, Mapleine flavoring has succeeded immensely. For one big Pennsylvania producer it was second only to vanilla in sales last year.

The same thing is happening wherever Mapleine is introduced to the trade.

Mapleine is economical and easy to use. Two ounces will flavor and color ten gallons of cream. It will not freeze out or change in flavor. Re-freezing does not affect it.

Order Mapleine in gallon jugs, 5 and 10 kegs or 50 gallon barrels.

A Budget for the Ice Cream Industry

In this Treatment of Budgeting in the Ice Cream Industry, the Actual Practices of a Representative Manufacturer, Tait Bros., Inc., Springfield, Mass., Are Used as a Basis, Beyond Which a Number of Suggestions Are Made

By ARTHUR LAZARUS*

IN every standard rate two separate forecasts are involved; one of the total outlay in dollars for the particular operation or group of expenses, and a second of the total quantity of the unit of measurement, hours, gallonage, miles, etc. When operations, as in the ice cream industry, are substantially alike in character day in and day out, and where volume of production, moreover, fluctuates widely throughout the year, standard rates become a vital part of, and more than a prelude to, budget making. If each division of the ice cream business is placed on a standard rate, operations will be as effectively controlled and at a lower cost than when, as in the usual budget system, definite money values and limits are allotted in advance for each distinct item of expense.

The ice cream budget naturally starts with an estimate of sales, and then concerns itself with the principal elements of cost, which, for convenience, are grouped under five main heads:

- a. Cost in Hardening Room.
- b. Cost to Platform.
- c. Cost Delivered.
- d. Advertising and Selling Cost.
- e. General and Administrative Cost.

The usual statement of profit and loss can be dispensed with for a distribution of the ice cream dollar.

Tait Bros., Inc., estimate the yearly sales in total gallons. The company does not as yet allocate the total gallonage by months. Neither does it make a separate study of competitive and merchandising conditions at each one of its plants. The company merely estimated at the beginning of the year that it should exceed last year's sales by 20 per cent, and this percentage of increase was distributed to months and plants equally.

Branches are, however, given individual percentages, based on previous years' earnings, of total business to be secured. Thus, of a total of 100 per cent expected sales, Springfield is allotted 35 per cent, Worcester 21 per cent, New Bedford 14 per cent, New London 11 per

cent, Fitchburg 3½ per cent, Holyoke 5½ per cent, and Northampton 9 per cent.

By the end of July of this year the percentage of increase in sales over the corresponding period of last year was 18 per cent. The percentage of increase in the various branches, however, fluctuated anywhere from 3 to 47 per cent, showing the illogicality of expecting each plant to produce the same percentage of increase in business. Quotas of sales for the next year will be established on a more nearly scientific basis.

A strong plea is made for establishing sales quotas on a monthly basis. This will aid the scheduling of production considerably. It is, of course, realized how upsetting a factor weather conditions may be. Ice cream requires a continuity of warm days. It will not do to know that the average temperature for the year was very much the same as that of the preceding year. There have, however, been some indications of a wholesome flattening out of the ice cream curve. The peaks and valleys for 1922 were not quite so jagged as in 1921.

For purposes of illustration, sales of 1,000,000 gallons a year are assumed at a net sales price of \$1.35 a gallon.

Budgeting the Cost in the Hardening Room.

Costs in the hardening room may be grouped under (1) Labor and Overhead, and (2) Material.

Material.

Owing to the fluctuations in the price of milk and cream, it is extremely difficult to forecast material costs. Tait Bros. Inc., make no attempt to do so, and have, however, correctly charged milk and cream into costs at the weekly average market price, even though their own creameries very largely supply these products.

Although it is contrary to the consensus of opinion generally maintained in the ice cream industry, it is felt that there are no insuperable difficulties to estimating material costs, and certainly not in terms of percentage of sales. The total fluctuations each year for a series of years, and the rapidity of such fluctuations,

Budget Basis New to Ice Cream Industry

Few ice cream manufacturers are operating on a budget basis. Representative ice cream companies in Massachusetts, Connecticut, New York, and Ohio specifically state they have not worked out a budget system.

The nearest approach to a budget system was found in the plant of Tait Bros., Inc., of Springfield, Mass., whose business started in a very small way in 1902 and has grown in twenty years to over a million gallons a year, with manufacturing and distributing plants at Springfield, Worcester, New Bedford and New London, and additional distributing plants at Holyoke, Northampton and Fitchburg. The comptroller of Tait Bros., Inc., G. A. Torrence, makes very modest claims for the accomplishments of his office:

"None of our accounting developments are what we understand as budgeting, but are preparatory to the establishment of a budget. Our work so far has been an endeavor to standardize costs and methods in all of our plants; to provide a ready means for holding heads of departments accountable within definite limits; to expedite the preparation of financial and operating reports; to distribute the heavy carrying expenses of the winter months equitable on a gallonage basis throughout the year, and then to lay the foundation for a real budget program."

An address before New England Ice Cream Manufacturers' convention.

Egg Yolk?

FULL information regarding the right method of using Egg Yolk in ice cream will be furnished you on request. Many ice cream manufacturers are pursuing the wrong method, thereby depriving themselves of most of the advantages of using Egg Yolk at all.

Get full value out of your Egg Yolk by using it in the proper manner, not only in French ice cream and frozen custards but to a moderate extent in all your creams to give them a milky tint, added smoothness and richness and additional food value and fat content—all accomplished without artificial means. This proper manner of using will also permit a high class, sweet, fresh egg such as

Velvet Yolk

to manifest its worth—and this proper method of using will also reveal the inferiority of a cheap yolk.

Write us today for full information.

THE INTERNATIONAL CO.

"The Right Flavor for Every Ice Cream"

Lombard and
Commerce Sts.

Baltimore
Maryland.

can be charted, and on the basis of such calculations and prices at the beginning of the year, material costs may be estimated. Such estimates can be revised when conditions during the course of the year seem to make changes necessary.

For purposes of illustration, the percentage of material costs to sales is set at $33\frac{1}{3}$ and in amount per gallon at 45 cents, to include the cost of cream, milk, condensed and other, sugar, gelatine, flour, fruits and nuts, cocoa and eggs.

Labor and Overhead.

Standards for labor and overhead in the hardening room have been established by Tait Bros. Inc., at a certain number of cents per gallon from the best figures obtainable at each of the company's seven plants. Some of the pre-determined standards are apparently closely set in some of the plants, while in others the variances are so great that the company will, in all probability, have to change them. The single most important factor in pre-determining costs of labor and overhead in the hardening room is the forecast of volume. If that is fairly accurate, actual operating results will closely approximate the pre-determined standards.

Under overhead in the hardening room the following expense groups are included:

Repairs	Fixed charges	Miscellaneous charges
Refrigeration	Power	Laboratory
General overhead	Ice cream supplies	General stores
General burden	Building expense	Washing
		Laundry.

For purposes of illustration, a standard for labor and overhead in the hardening room of 15 cents is used.

The items included under cost to platform are shipping labor direct and indirect, shipping supplies, fixed

charges of the shipping room, shipping expense and salt and ice, exclusive of ice, and packing service on the dealer's premises.

It is frankly difficult to gauge these costs in advance, but not quite as impossible as ice cream manufacturers suppose. Records are usually obtainable of last year's shipping total expense and gallonage shipped, and by dividing the former by the latter, workable enough standards are obtained for a start. Data relative to costs of salt and ice per gallon are rapidly accumulating, and as conditions of service become standardized, these will correspond rather closely. For purposes of illustration, the cost of salt and ice per gallon is fixed at 5 cents and the remaining shipping costs at 12 cents making a total cost to platform of 17 cents per gallon.

Advertising and Selling Budget.

It is only a question of a short time when Tait Bros. Inc., will budget on the basis of estimated gallonage, selling salaries and expenses, for these are fairly predictable. For purposes of illustration, the hypothetical figure of $7\frac{1}{2}$ cents per gallon is used for selling salaries and expenses, exclusive of advertising.

Advertising Budget.

Tait Bros. Inc., now set aside $2\frac{1}{2}$ cents per gallon of estimated sales for advertising, which compares interestingly with the policy of another company which sets aside 3 cents per gallon for the same purpose. If the estimated sales for the year are a million gallons, the advertising appropriation of Tait Bros. Inc., will be \$25,000.

The budget officers of the company control the gross amount to be spent for advertising. Its disposition by months, to territories, by kinds of advertising, and for various products, lies within the discretion of the advertising manager.

The shrewd business man advertises heaviest when business is most difficult to obtain, and so Tait Bros. Inc., spend the bulk of its advertising appropriation in the first four months of the year. The advertising manager is given considerable leeway as to the manner in which the advertising appropriation is to be spent. It is only reasonable to believe, however, that he carefully plans for the outlay of this advertising allowance.

For purposes of illustration, an advertising budget or plan by months, territories and kinds of advertising material is shown with pro-ratings that are hypothetical only. Competition and consumer conditions as well as plant sales will govern the distribution of advertising to territories. The distribution to advertising media however, depends on the experience and theory of the

are then divided by the estimated gallonage of sales, a standard charge for administrative and general expenses will be established.

This standard will be charged into operations and the difference between the actual and standard cost will be shown as a debit or credit on the statement of assets and liabilities.

In months such as November and December, when the standard charge is less than the actual, due to the fall in volume of sales, a debit will arise. In other months, such as July or August, offsetting credits will

as 14,000 gallons due to weather conditions. Our labor cost and overhead expenses will be as great in the 14,000 gallon week as in the 26,000 gallon week, and naturally overhead cost per gallon would be greatly influenced."

Indeed, it is just because of the wide fluctuation in volume from week to week and month to month, that it will aid this manufacturer to establish a standard rate for overhead for the year. In this manner it will be unnecessary to pay undue attention to weekly results which are not representative of the year's performance.

Advertising Budget

By Months and Kinds of Advertising

Kind	Year	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.

Store and Counter Display	2,500	500	500	500	500							250	250
Dealer's Printing	250											125	125
Total	\$25,000	3125	3125	3125	3125	1125	1125	1125	1125	2000	2000	2000	2000

arise, for the standard cost of general and administrative expense will in such months, due to heavy volume, more than offset the actual administrative and general charges. The foregoing may be clarified by a few very simple examples.

Month	Gallonage	Unit Charge for General and Administrative Expense	Total Charge for General and Administrative Expense	Actual General and Administrative Expense	Debit or Credit to Future Operations
July	200,000	10c	20,000	14,500	5,500cr.
Nov.	50,000	10c	5,000	13,000	8,000dr.

Such a standard charge for general and administrative expense becomes in the best sense, a budget, for it is a predetermined mark, to attain and excel.

A standard charge for general and administrative expense, based on a year's performance, adequately takes care of the following state of facts presented by a New England ice cream manufacturer:

"We have been unable to budget overhead because overhead is in direct proportion to volume and this, to a great extent, is influenced by weather conditions. At this season of the year, (August) our normal sales are in the vicinity of 18,000 gallons per week. But we have had weeks that ran as high as 26,000 and others as low

UNDER deliver expense Tait Bros. Inc., include chauffeurs' and helpers' wages, freight and express on sales, cans, tubs, and cabinet expense, and truck expense. Salt and icing expense is shown under cost to platform. Truck expense is subdivided into repair parts, repair labor, repair overhead, tires and tubes, outside repairs, oil and grease, depreciation, other fixed charges, miscellaneous charges.

No attempt is made to establish standards of expense for chauffeurs' and helpers' wages or for freight and express, although there seems to be no insuperable difficulties toward doing so.

A standard rate for cans, tubs and cabinet expense was initially set at 10 cents per gallon. That was subsequently reduced to 6 cents per gallon.

In developing standard rates for delivery expense the ingenuity of the accountants of the company was taxed, for adequate records of past delivery performance were kept only at one or two of the plants. An analysis, however, was made of chauffeurs' time and gasoline consumption, and a combined reading of the two produced rates that are working equitably.

A delivery standard in terms of an hourly rate is confusing when all other standards are expressed in terms of so much per gallon, and the hourly charge

should be supplemented with a composite delivery standard at so much per gallon. For purposes of illustration, let us use 25 cents per gallon as the composite delivery standard, and actual costs are less than this standard.

A standard hourly rate for truck expense, comprising the items previously enumerated, has been fixed by the company at 70 cents for Dodges and Fords, \$1.10 for two-ton trucks, and \$1.20 for 3½-ton trucks.

Commenting on this phase of the company's budget, for a standard rate is a phase of the budget, G. A. Terrence, comptroller, writes:

“One of the most interesting developments of our accounting practice has been the establishment of a standard hourly rate for each class of ice cream delivery truck, expressed in dollars and cents. Our method is to charge our automobile division for the entire cost of auto trucking, exclusive of chauffeurs' and helpers' wages. The automobile division then rents the trucks to the various plants and the several departments in those plants at the predetermined rates. The object of this is to have the automobile division “break even” at the end of the year.

The first six months show that the rates set are fair, and this has been of very great assistance to us in controlling trucking costs as well as in obtaining a proper distribution thereof to our respective products.”

The Division of the Ice Cream Dollar.

It is to be clearly recognized that the figures quoted for ice cream costs and income are:

1. Not actual, but close enough to operating conditions so as to be instructive.
2. Not confined to the experience of one ice cream plant, but built up from the operating results of numerous companies.
3. Not based on the experience of the entire country, but of companies located in the East.
4. Do not represent an ideal profit per gallon. They are, however, extremely valuable for purpose of comparison and checking. It is felt that numerous companies showing inordinately high profits per gallon in the summer months are not at the present time equitably distributing their expenses so that the heavy summer production will carry its just proportion of the total costs of the year. For numerous ice cream companies an incidence of production rather than the should be employed for unit costs.
5. Unit costs per gallon are most useful for control purposes when shown in terms of percentage. If the standard for material cost is 35 per cent and such costs are prevailing 40 per cent, it becomes readily possible for the ice cream manufacturer to decide whether a price readjustment is necessary or desirable, in view of competitive conditions and possible effect upon volume.

Net profit per gallon.....	.13	10

Comparative statistical information is all too rare in the ice cream industry, and before such information can

of much value the accounting of the industry must be placed more nearly on a standardized basis. There is insufficient encouragement for the ice cream industry to undergo a general improvement in its accounting procedure. Best available information indicates that the per capita consumption of ice cream is approximately 2 1/2 gallons a year. Significantly there has been little increase in ice cream consumption in the past few years. Estimates of ice cream consumption by the U. S. Department of Agriculture for three years are as follows:

1920.....	260,000,000 gallons
1921.....	244,000,000 gallons
1922.....	263,520,000 gallons

There is no good reason why this consumption should not be doubled or trebled. The history of the automobile industry indicates that the road to increased consumption, and incidentally to increased profits, is by way of lower and not higher prices. Yet ice cream manufacturers dare not operate on scantier margins until they possess more reliable and adequate information of their own business, and until they have clearly defined goals and a definite procedure to check performance against expectations. Management under a budget basis is one means to secure the needed additional control. The Policyholders' Service Bureau is prepared to assist any of its ice cream groups interested in installing a budget system.

STANDARDIZATION OF COSTS FOR ICE CREAM MANUFACTURERS.

By C. L. Turner.*

When considering the subject of "costs" we first think of bookkeeping and accounting and then it is realized that it is necessary for proper records to be kept reflecting the expenditures made for operating business. The ice cream business, as we know, has grown and developed rapidly within the last few years and during that period we have seen the development from the one man business to that of large manufacturers of ice cream, including not only individuals and partnerships but large corporations requiring numerous executives instead of the one man to manage the business. Due to this development, it has become necessary to administer and practice economies in the business. The old method of only keeping accounts with customers and with people from whom goods were bought is, of course, antiquated. The method of obtaining the results of a business for a year by what is called the inventory method is also obsolete. Double-entry bookkeeping is the recognized method of keeping books and in general practice today, and most concerns have found it necessary to amplify this with a system of cost finding. A system of cost finding in a business such as the ice cream business is not as difficult to install and operate as in some businesses. The "costs" are ascertained by what is known as the "process method of cost finding," that is to say, the cost is determined for a total for a period, which in many instances is a month's business, and then the per gallon cost arrived at by dividing the number of gallons sold or manufactured into the total cost. The main thing to be particular about is classification, and that brings us to the subject "standardization of costs," in other words, proper classification of costs so that the ice cream manufacturers will have or will be in position to make proper comparisons and know that they are administering their business properly and practicing the proper economies.

There is a distinct advantage in having the main

ADVERTISING IN THE ICE CREAM REVIEW IS A GUARANTEE OF MERIT.

classifications uniform for all ice cream businesses, in that it gives an opportunity for each manufacturer to know how the results of his business as determined by such classifications may compare with any composite average figures of a group of manufacturers that might be submitted at any convention or in any publication.

Your committee of arrangements having in mind such a goal, desire to submit at this convention composite averages of the results of a group of ice cream manufacturers to illustrate the advantage of uniform classifications for comparison purposes, and the disadvantage for comparison purposes, of any classifications that contain different items of cost.

A questionnaire was prepared and sent out by your committee to a group of manufacturers, requesting cost data under classifications deemed to be in detail enough to illustrate these points.

This summer two years ago I attended a convention in Atlantic City, where this matter was presented for the retail dry goods business throughout the country, and there was prepared and exhibited at that convention a chart showing the results of a number of businesses, averaged, expressed in percentages. Your committee of arrangements had in mind a similar comparison to be exhibited at this meeting today and called upon me to talk on standardization of costs and to put in chart form some of the results.

The main departments of the ice cream business are, of course, the manufacturing, distribution, selling and the administrative, so the first thing that we must consider is what classifications we need in order to get intelligent figures of the cost of doing business in these various departments. I have prepared a chart (which has been put on the black board) showing the results of my work in the investigation of this matter. (Chart follows):

	Results Per Gallon			Percentage of Sales		
	Ave.	High	Low	Ave.	High	Low
Net Sales.....	1.3450	1.4024	1.2519	100%	100%	100%

Total Other Expenses4827	.6428	.3972	35.88	45.83	31.73
Net Profit1090	.1787	.0481	8.11	12.74	3.84

The chart is divided into two groups. Group 1 shows the results per gallon expressed in dollars and cents, and group 2 shows the results expressed in percentages of net sales. Each group, it will be noted, has three columns—"Average," "High" and "Low." The "average" column comprises the composite average results per gallon as reported by the different members under these classifications; the figures in the "high" column represent the highest individual figures for each classification; and the figures in the "low" column represent the lowest individual figures per gallon for each classification. The "high" and "low" columns do not represent the total results of any particular individual.

Upon referring to this chart I think you will all agree with me that uniform accounting is necessary. I endeavored when this was prepared to have the figures submitted to me contain the same items. I do not believe I succeeded, as the "high" and "low" columns will indicate. It is apparent that some of the members in submitting the figures have included different items of cost under the various classifications.

These figures, I might say, comprise the compilation of composite averages of the figures furnished by several manufacturers with productions ranging from 150,000 to 250,000 gallons a year and represent the results of their business for the first six months ending June 30, 1923.

In discussing group 1, the "net sales" figure of \$1.345 in the average column represents the average selling price less returns and allowances per gallon of ice cream sold. The cost of "material used" averaged \$.5983 or practically 60 cents. The "labor" averaged 4 cents and a fraction. The "manufacturing overhead," which includes power and light, depreciation and repairs on manufacturing equipment and machinery, rent interest on any mortgages on the plants, real estate taxes, etc., averaged 11.4 cents, making the total cost of manufacturing 75.33 cents. Referring to the figures in the columns "high" and "low," it will be noted that the corresponding high figure is 91 cents and a fraction and the corresponding low figure is 68.72 cents or practically 68 cents; there being a wide variance between the high and low costs. The costs to this point, if classified correctly, represent the cost of the ice cream at the door. The average "gross profit" figure at this point shows 59 cents and a fraction. The highest gross profit was 69 cents and a fraction, and the lowest was \$.508 or practically 51 cents; that is to say, gross profit before deducting distributing and selling costs.

The "ice" and "salt" are shown in one amount. No attempt was made to classify them between "delivery" and "shipping and packing" because it was impossible to do it from the information submitted, and it was not requested separate for the reason that the figures would vary. It was preferred to ask the one question in order to have the figures more accurate. The cost of ice used for all purposes averaged 5.47 cents. Note the fluctuation in this cost: The highest was 9.09 cents and the

lowest 3.33 cents. The average cost of salt used was 2.84 cents, the highest was 4.31 cents and the lowest 1.97 cents. The "shipping and packing" is an average figure on the entire gallons produced and should be borne in mind, because the correct way to arrive at this cost is to segregate the shipping and packing gallonage from the delivery gallonage. This I could not do with the information submitted, and it was not thought that there was sufficient time to make a questionnaire elaborate enough to get it in. The average shows 5 cents and a fraction; highest 10.49 cents and lowest 1.52 cents. The next item "delivery expenses" is the very interesting item of the costs; that is to say, the cause of worry to most manufacturers and where plenty difficulty arises in practicing economy. The average shows 20.51 cents per gallon, the high 33.34 cents and the lowest 12.48 cents. Note the fluctuation. If the classification has been made correctly and strictly in accord with the questionnaire sent out, which listed the items that should be classified under this classification, you can readily see that there is room for economy in some instances in the administering and operating of the delivery part of the business.

The "cabinet expense" represents the maintenance of the cabinets only, no ice included. That is, only repairs and depreciation. The average is 1.4 cents, the highest figure 3 cents and the lowest is .69 of a cent. The selling costs averaged 7.75 cents, high 11.32 cents and the low 5.73 cents.

The "administrative and general" costs average 5.17 cents, the highest is 8.4 cents and the lowest 2.05 cents. This variance may be accounted for by the fact that in sending out the questionnaire, members were asked to eliminate executive salaries; that is, in case of a proprietorship the salary of the proprietor; in case of a partnership the salaries of the partners; and in case

of a corporation the salaries of stock-holding employees; because in the last few years the majority of the salary accounts have depended on the amount of income and the amount of taxes that had to be paid, and for that reason it was thought better to eliminate same from the figures.

We have a "total other expenses" averaging 48.27 cents, the highest is 64.28 cents and the lowest 39.72 cents. The net results of the averages show a profit of 10.90 cents per gallon, eliminating the salaries as aforesaid; the highest profit was 17.87 cents per gallon and the lowest profit was 4.81 cents per gallon. There is a difference here between the high and low of 13.06 cents a gallon.

There is no doubt that the figures in the chart indicate that it is very necessary to have a proper classification in order to get correct details of the cost of operating a business.

Under group 2, the same figures are expressed in percentages of the selling price, which may be more clear to some of you. The "material used" on the average was 44.48 per cent of the selling price. The highest figure was 50.61 per cent and the lowest figure 43.51 per cent. These figures are not so far apart considering that they represent the bulk of the manufacturing cost. This shows that most of the ice cream manufacturers have fairly good control of their materials, and I imagine that that classification is approximately right. There should be no difficulty in obtaining the cost of materials used. In the "labor" you will see a fluctuation. The average showed 3.05 per cent, the high 4.44 per cent and the low 1.76 per cent. The fluctuation in these figures is probably occasioned by some of the manufacturers including in this item of labor costs that should be charged to shipping or delivery.

The "manufacturing overhead" shows 8.48 per cent on the average, the high is 11.04 per cent of the selling price and the lowest is 5.73 per cent. This fluctuation is probably due to the fact that some are not taking adequate depreciation. Depreciation occurs whether you make money or not, and should always be included as an item of cost, and if you do not include depreciation you are only fooling yourself, you are not fooling anyone else.

I have just completed the investigation of some public service companies. The question came up, "Will they do not these people make money, because they used to make money?" Before the income taxes, that is, before 1917, every time that they rebuilt the plant it was charged to capital and consequently they had capitalized it at about six times. After the income tax came into effect and when they reconstructed the plant in 1917 and 1918 the charge was to expense. Prior to that time such expenditures were always capitalized. They had built up such an investment in plant and paid out all the profits in dividends to such an extent that now they cannot earn enough upon this increased investment, even after having their income almost doubled over the pre-war period, to pay their fixed charges. So it is very important to consider depreciation. It is an item of cost, there is no doubt about it. The old basis of waiting until after the year's profit was determined to see how much should be charged off as depreciation, is entirely wrong, unscientific and there is no justification for it because such practice does not properly protect the business against wear and tear in property. It should be taken in as an item of cost as it accrues.

We find the "cost of manufacturing" averaged 56.01 per cent of the sales price, the highest was 65.4 per cent and the lowest 54.89 per cent, a fluctuation

BAKER

System Refrigeration

Are you still using ice and salt in manufacturing ice cream? If so we can show you how a Baker System Refrigeration will do the work more effectively at a fraction of the cost. Besides, with a Baker you can make your packing ice cheaper than it can be bought.

Personal Survey of Your Plant

Baker System Refrigeration is built to order—"tailor-made" to your individual conditions. No order is accepted until one of our refrigerating engineers has made a personal survey of your needs. This guarantees to you an efficient plant which should pay for itself in a very short time.

One southern ice cream manufacturer said he could buy a Baker plant every 16 months out of the savings made over the ice and salt method.

Get Your Copy Bulletin 65 D It's chuck full of useful information you will value. It explains the Baker System Refrigeration in detail and gives you the reason why over 5,000 Baker plants are in successful operation.

10 per cent, the "gross profit" fluctuating approximately the same amount.

The "gross profit," that is, before applying cost of shipping or delivering from the plant, shows an average of 43.99 per cent of the selling price, the high 49.26 per cent and the low 40.62 per cent.

"Ice" shows an average of 4.07 per cent of the selling price, the highest was 6.48 per cent and the lowest 2.66 per cent.

"Salt" shows an average of 2.11 per cent of the selling price, the highest was 3.07 per cent and the lowest was 1.57 per cent. The fluctuation is not so great. Evidently the cost of salt used is not difficult to obtain.

"Shipping and packing" the average shows 3.81 per cent, the high 7.48 per cent and the low 1.21 per cent. This is one figure that may not be accurate due to the manner in which it was handled by the different manufacturers when submitting the detail.

"Delivery expenses" shows an average of 15.25 per cent of the selling price, the highest was 23.77 per cent and the lowest was 9.97 per cent.

"Cabinet expense" 1.04 per cent on the average, the high 2.18 per cent and the low 0.16 per cent.

"Selling" 5.76 per cent on the average, the highest 8.08 per cent and the lowest four and over a half per cent.

"Administration and general," the average shows 3.84 per cent, the highest was 5.99 per cent and the lowest 1.64 per cent.

"Total other expenses," other than manufacturing, 35.88 per cent of the selling price on the average, the highest was 45.83 per cent and the lowest 31.73 per cent. The profit on the average was 8.11 per cent of the selling price, which is a fair return. The high, using the highest cost in each instance would re-

sult in no profit. Instead, there would be 23 per cent of our selling price as loss; that is to say these figures would add up 123 per cent while the selling price shows 100 per cent. On the other hand, the lowest figures in each instance would show a profit of 27 per cent. The highest individual profit, however, was 12.74 per cent of the selling price and the lowest 3.84 per cent of the selling price.

I also have figures that show the same results for another group whose yearly capacity ranges from 300,000 to 600,000 gallons but due to the fact that I do not have a large enough blackboard I could not exhibit it but if it is desired by the association, I will have both the charts mimeographed and distributed.

I think that the variations shown between the high and the low figures will show that it is necessary to practice economies in the business to limit fluctuation and that in order to do so one must know these results. If you do not know the cost of operating the various departments of your business you are at an extreme disadvantage because it is my opinion that in any competitive business such as the ice cream business it is impossible to have price fixing controlled by cost for the reason the selling prices may differ in the territory in which you are doing business and your competitor may be selling at prices lower than your cost after adding a profit. If your competitor is selling below your cost what you must do is to determine what your selling price is going to be and then start and cut down the various items of expense and overhead to enable you to make a profit. These figures should be collated monthly and monthly comparisons made, and economies practiced during the year and not wait until the end of the year after the expenses have been incurred, because then it is too late; in other words, too late to lock the door because the horse is out of the stable.

How do you decide on temperature instruments?

Most manufacturers set *Tycos* as the standard. They do this because of past performances. You will find, as they have, that satisfaction comes from using *Tycos* for indicating, recording, and controlling temperature and pressure.

Catalog part 500A gives you the particulars.
A word from you brings a copy.

Taylor Instrument Companies

ROCHESTER, N. Y., U. S. A.

Canadian Plant, Tycos Building, Toronto

There's a *Tycos* or *Taylor* Temperature Instrument for every purpose

ICE CREAM WAS FIRST WISH OF RETURNING SPANISH ENVOY.

A dish of ice cream was the first wish of Envoy Alexander P. Moore, ambassador to Spain upon his return to America early in January for a visit of several weeks.

Envoy Moore declared that the United States was the best governed and the greatest nation in the world, the ambassador immediately stated that his most important plan was to look up a soda store and buy a dish of ice cream and enjoy himself in American style.

He said that after studying conditions abroad he could not escape the conclusion that Americans had much to be thankful for, and there was no mistake in his opinion that ice cream is one of the delights in which people of this country should be very grateful.

"I wish Spaniards would acquire a taste for ice cream soda," the Ambassador said, after stating that he would return to his duties in Spain at the expiration of six weeks.

FREEMAN DAIRY COMPANY ENLARGING

The Freeman Dairy Company of Flint, Mich., has taken over the ice cream plant built by the Davis Ice Cream Company about a year ago and are going to enlarge very materially. The plant will have a capacity of about three thousand gallons daily and will be iceless as far as possible. They intend to equip all their dealers with Frigidare iceless cabinets, made by the Delco Lith Company of Dayton, Ohio. They are also equipping their dealers at other branches throughout the state with these iceless cabinets as far as possible.

Make This Test at Our Expense

Place a trial order. Use all you need to give it a full, fair trial. If MICHAEL'S Mexican Vanilla Powder does not produce the finest vanilla ice-cream you ever tasted, return the remainder at our expense, and we will cancel the charge. DO this, by all means.

REMEMBER THE DATES FOR YOUR STATE CONVENTION—AND BE THERE.

Wisconsin Committee to Study Automatic Refrigeration

To Confer with Similar Committee from Illinois Association. Steps Taken at Annual Convention. Advertising and Sales Promotion Discussed

Kramer Named President

AUTOMATIC refrigeration and co-operative advertising formed the principal points of discussion at the annual convention of the Milwaukee Association of Ice Cream Manufacturers. The convention, which was held at Milwaukee, January 23 and 24, was one of the most spirited the association has ever held, though lack of advance publicity held down the attendance. Hotel Plankinton was headquarters.

A committee was appointed to confer with one recently appointed by the Illinois Association of Ice Cream Manufacturers on the matter of iceless refrigeration, with instructions to make recommendation to the members as to what to do with this newcomer to the industry. It is not the purpose of the committee to pass upon and recommend any particular types of the iceless cabinets on the market, but rather to ascertain just how these cabinets now fit into the ice cream manufacturers' business, to make general inquiry into the various phases of the new cabinets that manufacturers must familiarize themselves with to understand how to make ready for this new order of conditions.

That the iceless cabinet will bring a new order of conditions to the industry was a conclusion that virtually all of the speakers seemed to have reached. It was following a spirited general discussion along the lines that the cabinet would revolutionize conditions in the industry that motion was made for the president to appoint a committee to confer with the committee that the Illinois association now has in operation.

N. Loewenstein, secretary of the Illinois Association of Ice Cream Manufacturers, told the convention about his association's inquiry into automatic refrigeration. He also discussed general conditions in the industry.

AVERY interesting discussion along the lines of general advertising of ice cream was under way when William F. Luick explained that the National Association of Ice Cream Manufacturers now has under way plans to wage a slogan campaign. This, Mr. Luick intimated, may lead up to a general advertising campaign by the national association.

The discussion on advertising centered around certain points that may be set out as follows:

First, it should be in the nature of educating the public.

Second, the retailers should be made acquainted with the campaign and instructed to keep on the alert to help promote ice cream sales at all times.

Third, such a campaign should be financed through an assessment in proportion to each manufacturer's output in gallonage.

Among the speakers at the convention were: Edward Klinenberg of the People's Fuel and Supply Co., Chicago, who told the delegates some very interesting things concerning electric trucks; F. B. Riley, Detroit

Creamery, Detroit, Mich., who gave revised edition of the interesting speeches he had made at previous conventions on "Mechanically Refrigerated Cabinets;" Prof. H. W. Gregory, Purdue University, La Fayette, who discussed "Experiments in Ice Cream;" J. Fess, Tri-State Ice Cream Co., La Crosse, on the subject of pasteurization; C. A. Krohn, Melo-Ice Cream Co., Plymouth; and Prof. H. H. Sommers, University of Wisconsin, Madison, on "Controlling the Overrun of Ice Cream."

The convention followed Wisconsin's usual novel way of opening for business at a luncheon, the club room of the Hotel Plankinton being the scene.

PRESIDENT DUFNER called the delegates to order and introduced the mayor of Milwaukee for the welcoming address. The mayor said he was pleased over the high standard of ice cream made in Milwaukee. He said completion of present plans would mean more transportation over the Great Lakes than now passes

through the Panama and Suez Canals combined. He said Milwaukee will have a harbor to receive any vessel that floats on the Atlantic today. He spoke of plans for a system of adequate parks throughout the state of Wisconsin. The mayor declared that Milwaukee has less labor trouble than other large cities.

The response to the address of welcome was delivered by C. E. Wright of Beloit, who said the ice cream manufacturers always felt welcome in Milwaukee. He declared that Milwaukee produces the best ice cream in nine states. He spoke of the success of Wisconsin's association, asserting that it had made the manufacturers better acquainted and had created a spirit of helpfulness with no one wishing "to put any body else out of business."

He urged the manufacturers to "get closer together," make a better product and give better service. The public, the speaker said, demands quality and service.

Following the speaking at the luncheon, the association went into a round-table discussion. This is covered in the proceedings of the convention, which begin in this issue.

AMEETING of the Badger Flyers followed the general luncheon. President J. T. Purvis called the meeting to order and asked the members to take turn in telling of ideas they had picked up in their different territories, "wise, unwise and otherwise."

The iceless cabinet, sales promotion and trade publicity were the principal topics. Henry W. Stern said the dealers are not properly educated, and know nothing of ice cream salesmanship. He said ice cream display windows are rarely seen, whereas virtually every druggist most of the time has his windows cluttered up with tooth paste, safety razors, toilet water, etc. H.

SCOTT MANUFACTURING CO.
1501 HOWARD STREET OMAHA, NEBRASKA

Eskimo Pie Corporation,
5 North Wabash Avenue,
Chicago, Illinois.

Gentlemen: Will you be kind
enough to write and give us
the story of your ESKIMO
PIE BALLOON DAY? We are
interested in it.

Name
Address
City

The name, ESKIMO PIE, is nationally known
like Ivory Soap, Coca Cola, and Aunt Jemima's
Pancake Flour. Those who tried to imitate our
name and package are discouraged—most of
them have quit. Almost all of the reputable ice
cream manufacturers are making ESKIMO PIE.

We have an ESKIMO PIE BALLOON DAY
plan for those who hold our franchises. It has
been a "howling" success wherever it has been

tried. Large and small manufacturers alike en-
dorse it. We recommend it to you.

Our slogan for February is "Keep up the Win-
dow Strips."

stated that here is a need for greater ice cream publicity, asking that a committee be appointed to get into the newspapers items about ice cream, the food value of the product and the high standards of the industry.

Representatives of The Olsen Publishing Company told of the Public Relations Department of this company, which has for its duties the sending out of news and editorial matter relating to dairy products.

President Purvis appointed H. P. Olsen, president of The Olsen Publishing Company, chairman of the committee. The chairman will announce the personnel of the committee later.

Others to speak were Charles Russ, Crown Fruit & Extract Co.; Charles Gifford, Swift & Co.; Edward M. Fritz, Grand Rapids Cabinet Co., Grand Rapids, Mich., and O. E. Harwood, A. H. Barber-Goodhue Co.

Officers were elected as follows, at the meeting held

the next day: President, L. E. Taylor, Menasha Printing & Carton Co., Menasha, Wis.; vice-president, E. R. Hansen, J. B. Ford Company, Milwaukee Branch, 1st National Bank Bldg., Milwaukee, Wis.; secretary, O. E. Harwood, A. H. Barber-Goodhue Company, 306 W. Austin Ave., Chicago, Ill.

A NUMBER of exhibits were shown on the mezzanine floor of the Plankinton. Among the companies exhibiting were:

The Grand Rapids Cabinet Co., Grand Rapids, Mich., represented by Edward Fritz; Geuder Paeschke & Frey Co., Milwaukee, represented by Louis Hois, advertising manager, and M. O. C. Chamberlin, salesman; Stout Manufacturing Co., Milwaukee, represented by L. H. Payne and C. L. Zimmerman; Stover Co., Milwaukee, represented by J. H. Hill, and the Viking Pump Co., Milwaukee.

Wisconsin Convention Proceedings

Meeting called to order by President S. J. Dufner of Eau Claire.

President: I welcome you all and am glad you are here. We have the honor of being welcomed here in Milwaukee by the city's mayor, Mr. Hoan.

ADDRESS OF WELCOME.

Mr. Hoan, Milwaukee.

Mr. Chairman and members of the Association of Ice Cream Manufacturers: As the mayor of Milwaukee, I am speaking for the people of Milwaukee and wish to

say that we are glad to have you here. Just a word about Milwaukee. It is the metropolis of this state of Wisconsin, the state we all love so well. Milwaukee as the metropolis of this state is trying to fulfill its part. It is a great commercial point—there is more commerce shipped through here than in all the rest of Wisconsin. This is a wonderful asset and Wisconsin has it right at its doors. The harbors being developed are going to be something wonderful for the city and the state. There is no other city on the Great Lakes that has acquired so much property right along the lake and we have it all but three or four blocks. Part of it is for highways. I also want to call attention to the wonderful harbors we will have, they will bring the ocean vessels in here, they will be ready to receive any ship that comes in. Milwaukee is glad to build these harbors without any contribution. We are doing it with little or no expense to our citizens. By giving us the property they are enhancing the value of their own property.

I am not going to spend much time telling what we are doing here. I want to say that we appreciate your coming here. However, we have never flinched on any duty of our part of the state and we trust that when you do come here, that you will appreciate your coming. Wisconsin has beautiful places, its lakes and beautiful summer resorts. We have wonderful roads in Milwaukee—some of the finest in the state. We build them without issuing any bonds or going into debt. We paid cash for every foot of road you can look at in Milwaukee and Wisconsin.

To the ice cream men I can only say that we are an industrial city—we make it a place worth while. We are the most peaceful and law-abiding people in the world. That is our record, we have the least crimes committed, the least number of homicides, we have the best order and the least amount of labor disputes. In fact, we are proud of Milwaukee. We want the rest of the state to know that we are proud of your coming here and what the state has done for us, and we also appreciate that the ice cream industry is an important one to us.

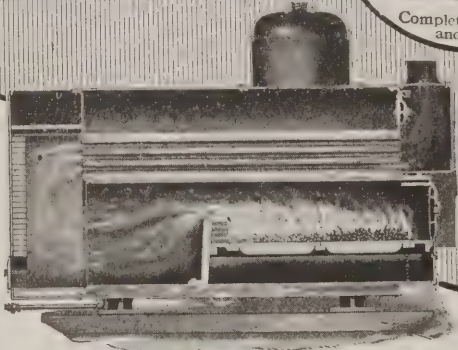

We hope that you will not only have a successful convention but also an enjoyable time, and while you are here, and if you can get intoxicated on "Lake Michigan"—just telephone to me and I am sure it will be

Leffel

Scotch Marine Boilers

Complete with skids and fittings

QUICK firing and steady steaming ability make Leffel Self-Contained, Internally Fired, Horizontal Return Tubular, Portable Boilers ideal for use in Creameries, Dairies and Ice Cream Factories. Hot gases of combustion travel **twice** through the full length of the boiler. Every possible heat unit is used to produce steam. This efficient application of heat explains why Leffel Scotch Marine Boilers are replacing less suitable types throughout the milk handling industry. Sizes 6 to 100 H. P. Meet requirements of all State boiler laws.

-- THEN and NOW --

The Locomotive supplanted the Stage Coach; the Automobile has absolutely superseded the antiquated horse drawn vehicle, likewise the Homogenizer is rapidly replacing the old-fashioned mixing machine.

THE NATIONAL HOMOGENIZER

With its revolving head, is the greatest step in advance since homogenization was introduced.

What is a Homogenizer?

A high pressure pump with a mixing or homogenizing head.

THE HEAD IS THE THING.

Doesn't it stand to reason that particles of fat **GROUND** between a revolving surface and a stationary surface will break up into smaller particles and therefore homogenize better than by other methods in use?

It will pay you to investigate.

Also doesn't it seem logical that if the liquid is ground, as stated above, **THREE TIMES**, and at each grinding the revolving and the stationary surfaces are closer together than the previous grinding, that the mix will be homogenized better?

The National Homogenizer is the only Homogenizer using a revolving homogenizing head.

EVERY MANUFACTURER IN DIXIE SHOULD BE A MEMBER OF THE SOUTHERN ASSOCIATION.

such a surprise to me and to the chief of police, and we will be glad to do the right thing.

I thank you. (Applause)

President: We certainly appreciate the address of welcome by Mayor Hoan and wish to thank him at this time. We will now listen to the response by C. E. Wright of Beloit.

Response—Charles Wright, Beloit.

IN behalf of this association, I want to thank the mayor for his address of welcome. We always know when coming here that we are welcome. It (Milwaukee) is about the only city in the state to take any of these conventions. It is located so that we can get here easier than other places—for that reason we feel like coming here.

The mayor's idea about our ice cream is correct. Wisconsin produces the best ice cream produced in the United States.

Regarding our association—we all know each other and our meetings are to get better acquainted with each other and learn one from the other—we are all plugging together and are not trying to put each other out of business. These meetings are to bring each other to the other and to give better service. We were talking a short time ago about service and products. We believe service is one of the greatest things today. They want quality first and service next and the man who recognizes that fact is the man who is going to get ahead at the present time.

A man just asked me what I thought about refrigerated cabinets. I don't know only this—the thing has been coming for years and you all know it and you have got to take it whether you want it or not. It is advancing civilization. It is going to revolutionize the

ice cream business. I am not a prophet so I don't know much about it. Again I want to thank the mayor for his address. We are all going to be as good as we can. We are most always good. I thank you.

President: With your kind permission we wish to take the liberty of changing the program a little. The round table discussion has been placed next on the program. We know that ideas of all kinds come to each and every one of us, and I believe that after we have heard all the talks, we will have more to talk about and discuss than we have at this time. Consequently we will take the liberty of changing the program a little. We will have Edward Klinenberg's talk on electric trucks at this time.

Experience in Delivering by Electric and Gas Trucks—

By Edward Klinenberg, Chicago.

THE ice cream now finds itself in a position where if more profit is to be realized, that additional profit must come from reducing the cost of doing business.

We have three kinds of costs, viz., raw material cost, manufacturing costs and selling and delivering costs. How careful we are in buying our raw material and in plant operation too. But how many stop to figure their delivery cost. Generally speaking, the delivery equipment is bought and then left to the garage foreman, or someone else to keep in running condition, and here it seems to end.

In the past we have given too little attention to delivery costs. We have all discussed them, various suggestions have been made as to how to reduce them, but very few of us have taken any trouble to keep tab on our delivery records, consequently much of the discussions we have had have been wasted.

WE have been of the opinion that any ice cream man who does not use electric trucks on most of his work is wasting money. Perhaps some of your problems are different from ours, and possibly some of you know how to run gasoline trucks more economically than I can. I know some people who manage to make their electric trucks cost more than ours. What may be good for us may not be equally good for you. But we are saving four (4) cents per gallon of cream delivered by our electric trucks. We are buying more electricies so that we will be able to deliver the bulk of cream at the lower cost. And because electric trucks are saving the People's Fuel & Supply Co. four cents for every gallon delivered, I am going ahead to give you a few comparative figures.

My company is in the coal, ice and ice cream business, not the transportation business. Like the rest we do not make much of a feature of delivery cost accounting. Unlike the American Railway Express we could not tell you offhand just how much a day or a mile it costs to operate a certain type of truck. This probably is why we have not adopted electric trucks a long while ago. But while we have not kept an elaborate delivery cost record, we have kept the expenses incurred by the electric trucks apart from the expenses of the gasoline trucks, so that it was possible to compare the two as groups, though not as individuals. Furthermore, we have records of each truck as to days worked, miles traveled and gallons delivered.

Electric Versus Gasoline.

The cost, comprising as it does, the total expense of a group of gasoline trucks compared with the total expense of a group of electricies, are not as clear cut as they might be. But they show definitely which trucks

How Do You Buy Your Cleaners?

Too often the ice cream manufacturer thinks of cleaners as just cleaners without considering their fitness for the particular work they are expected to do.

Experience has so proved the expensive folly of this method, that every day sees an increasing demand by ice cream manufacturers for the efficient, dependable, and economical cleaner.

The reason is logical when you understand what this cleaner is, and what it accomplishes.

Wyandotte Sanitary Cleaner & Cleanser is a non-caustic, non-acid, inorganic, greaseless powder. It goes into solution quickly, without any waste. Every particle is an active, harmless, cleaning particle. It is fatal to dirt, grease and odors.

Wyandotte Sanitary Cleaner & Cleanser will therefore provide your plant with that distinctive sanitation which means quality insurance at the lowest cost.

It Cleans Clean.

are more economical and give a fairly accurate picture of the difference in expense of the two methods. First I will give you the data upon which my conclusions are based. Then I will show how this figures out in terms of cost per day, per mile, per gallon, per ton mile and per gallon mile. In all of these calculations the drivers' wages have been eliminated because being on a commission basis they would only refuse the discussion of truck costs. The cost per service day was:

Gasoline.....\$10.43. Electric.....\$7.06.

This covers depreciation, insurance interests, cost of trucks, etc. The gasoline trucks travelled further.—37 miles against 32, but were of the smaller size and carried less loads. They averaged 2.75 tons as compared with 4.5 tons electrics. If a comparison were made of the same size trucks and the same mileage, the electric undoubtedly would have shown an even greater advantage than they do here. They would probably be 40 per cent cheaper instead of 32.5 per cent. The cost per mile was,—gasoline \$0.282, electrics—\$0.221. That means for every dollar the electrics went about a mile further than the gas, 4.53 miles as compared to 3.55 miles.

Figured in terms of ton-miles, the electrics, had a tremendous advantage, gasoline \$0.1025, electrics \$0.049. For every dollar spent on electric transportation we got 29.41 ton-mile, but that same dollar would only buy 9.76 ton-miles of gasoline truck transportation.

If we use the gallon mile as a unit the comparison is not much different, gasoline \$0.356, electric \$0.186. The cost per gallon delivered is gasoline \$0.1356, electric \$0.0595. There are, of course, two reasons for this wide difference:

First: The operating costs of the electric trucks are lower.

Second: The electrics had the best routes, which helped their showing.

At the present day's cost of gasoline, it takes from 15 to 20 gallons of gas and one-half to one gallon of oil per working day, which amounts to \$2.15 to \$3.10 per day, regardless of the distance your truck travels, because—well, how few ice cream drivers shut off their motors when they come to a stop? Not many, in fact, none. The motor pounds along all day long until it reaches the garage. In the first place you cannot compel your driver to shut off the motor because, if he has, say 40 or more stops, it would mean cranking a motor that many times, which in itself would be a day's work. On the electric there is no cranking, no power consumed while the truck is idle, and a daily charge may amount to \$1.00 maximum. So here again we have quite a difference in the daily cost of operation of the electric, as compared with the gasoline truck.

All Figures Favor Electric.

We have discussed this matter of relative costs from many angles. I have figured costs per mile, ton-mile, gallon-mile, per day and per gallon. No two methods bring out the same ratio of cost, but all are alike in one respect, they indicate that our electric trucks were working at a much lower cost than our gasoline trucks. The People's Fuel & Supply Company like electrics because they save us money, but there are still other reasons.

Electric Safer—More Reliable.

We like their reliability. We have much less to worry about breakdowns and lost time due to repairs and overhauling. During the period studied the gasoline trucks were in service 82 per cent of the time, the electrics 84 per cent.

Comparative Repairs.

For example, if the oiler overlooks filling the crank case with sufficient oil, and the driver is one that cranks up the truck without examining it for oil, gas and water, we may have a few burned out bearings which cannot be replaced without considerable work, while on the electrics the driver does not have to look at the oil, etc., just glances at the meter which indicates the charge in the battery, and, should he overlook this, the most serious consequence would result in finding himself out of power, necessitating towing in of the truck.

Supposing he should back up the truck to a platform and leave it in speed (and this happened to us one this past summer) we have a burned out armature which can be replaced in a very short time without laying up the truck.

Again we like the electric because they are safer. Accidents are rare because they cannot speed. A very important fact today—no tampering of governors. They get over the routes just about as fast as gasoline trucks. We have run gasoline trucks and electric trucks over the same routes on consecutive days. Their time was practically the same. A 5-ton electric with a maximum speed of 10-12 miles per hour, was found averaging 10 miles per hour for all the time it was in motion. A gasoline truck governed to 15 miles did not do appreciably better.

Next to economy, reliability and safety, perhaps the greatest advantage is cleanliness. In the ice cream business as in any industry where food is delivered, this is important. There are many other advantages but these are less important, and moreover are disputed by some. These include appearance, absence of engine heat, ease of handling, lack of exhaust noises caused by racing motors, and backfiring, making the driver a salesman.

not a chauffeur; you may ask any driver who has driven either, except he who craves speed.

Charging A Very Simple Matter.

Glance at the meter on the truck and set your charging apparatus accordingly. It automatically takes care of your battery charge, shutting off when to the required amount, avoiding burned out batteries. Put a little vaseline on your controller once a week and perhaps once every two months; see that your wheels, if they have internal gears, have plenty of lubrication, and your troubles are over.

How We save 40 Per Cent.

The meat of our experience is this. It costs us \$8.00 per service day for our electric trucks. The average cost per service day on our gasoline trucks is \$10.43. This includes some small trucks as well as the larger ones. Considering the larger ones only, for it would take a 5-ton truck to do the work the electricies are doing, the cost per service day would be about \$11.50. That means that our electric trucks are saving us nearly 40 per cent of the cost of doing the same work with gas trucks. It is costing 6 cents per gallon to deliver by electric trucks. If we put our gas trucks on these same routes it would cost us 10 cents.

The original cost of an electric truck is about \$3,200. We have seven of them.

Question: How often do you charge them?

Answer: We charge them every night. A full charge takes six hours.

Question: What is the total weight of a battery in a two-ton truck?

Answer: About 1,800 pounds—Life of battery? We have them on a monthly basis, mileage of one being about 54 miles round trip. With the seven trucks we have, we have not had one case of injury nor any trouble, no accidents with our electric trucks. They are much more easily controlled. I wish you gentlemen who are interested in trucks would look into this matter.

Thank you.

(Continued in next month's issue)

COLORADO ASSOCIATION ACTIVE.

The newly organized Colorado Association of Ice Cream Manufacturers is working out ambitious plans to make its body an important factor in the ice cream manufacturing industry. Earl B. Darrow, president of the Pueblo Ice Cream Co., Pueblo, Colo., is president of the Colorado Association of Ice Cream Manufacturers which was formed at Pueblo last November.

The secretary is E. L. Carlson, vice-president of the C. G. Carlson Ice Cream Co., Denver. More than fifteen firms are represented in the association, representing virtually every part of the state. The enthusiasm of the members over the outlook for the association leads officers to believe that through the association some very effective work will be done to the industry in that state.

Statistics for 1923 show that while the butter and cheese production of Colorado declined, there was a great increase in ice cream production in 1923. The total ice cream production in 1923 was 1,739,421 gallons.

KNOBBE HEADS CHICAGO MANUFACTURERS.

John W. Knobbe was elected chairman of the executive board at the annual meeting of the Chicago District Ice Cream Association. H. O. Shedd was re-elected secretary-treasurer. The executive board elected consists of Messrs. Knobbe, Cunningham, Klinenberg, Tiec, third Tuesday of each month in the Hotel Sherman.

The association's regular meetings are held on the 1st, 3rd, 5th, 7th, 9th, 11th, 13th, 15th, 17th, 19th, 21st, 23rd, 25th, 27th, 29th, 31st, and Thompson.

The Most Complete Service Ever Offered to Ice Cream Manufacturers

WE make the above statement without hesitation because in all our experience in the ice cream industry we have never known of a service that even approached in scope and strength the service we are offering ice cream manufacturers this year.

Consider in the first place the Kist Fruit Flavors—eight of them—Orange Kist, Lemon Kist, Cherry Kist, Grape Kist, Lime Kist, Strawberry Kist, Raspberry Kist, Pineapple Kist. These flavors in themselves, enable ice cream manufacturers to sell a greater gallonage, simply because they offer a larger variety of the finest fruit flavors obtainable.

Then, in addition, we have completed a free sales and advertising service to back these flavors which is the result of a broad advertising experience in the ice cream industry. Every month, beginning with the month of March, we are issuing "The Kist Business Builder" for our customers, outlining completely the manufacturing, sales and advertising service for every week during the month, as follows:

1. Tested and proved formulas for Brick and Bulk Specials—one of each for every week—Free.
2. Striking hangers for your dealers. The finest kind of art work lithographed in eight colors and imprinted with your own firm name—Free.
3. Effective newspaper advertisements in two sizes, complete and ready to run over your own name on every Brick and Bulk Special—a new set of ads for every week—Free.
4. Unusual Window Posterettes printed in colors and illustrated, on every Brick and Bulk Special and each imprinted with your firm name—Free

WE are illustrating here cover and pages from the March issue of the Kist Business Builder and the small reproduction of the window posterette that appears in that issue.

Write for a copy of "The Kist Business Builder." Go through it thoroughly and realize that but the simple act of filling in a requisition monthly will set to work for you, as though it were your own, in your own plant, an Advertising Department that would cost you many thousands of dollars each year to operate for yourself.

To sum it all up, we offer to sell you not only the finest fruit flavors you can buy, but we offer to supply you free with a Merchandising Service which will sell them for you as well.

Since announcing this service, it has been accepted, enthusiastically, by leading ice cream manufacturers all over the country. There are more than fourteen hundred using the Kist Fruit Flavors today. Perhaps your territory is open. Fill in the coupon and mail it today, or, to make sure, send us a telegram at once.

Citrus Products Company, Ice Cream Division, 54 E. Kinzie St., Chicago, Ill.

GREATER SALES AND LOWER PRICES THROUGH ICELESS CABINETS.

(Continued from page 16)

great deal of waste due to the meltage of ice. In addition to this most important saving, the dealer is benefited greatly from the fact that he has the advantage of the proper temperature at all times for his ice cream, which means that in serving hard ice cream always, he gains from ten to twenty per cent as compared with serving ice cream which is soft.

"Also, it eliminates the old complaint of salty ice cream and overcomes all of the nuisances of salt water and moisture together with the necessity of having a driver ice up each day which in itself has always been most annoying. Also, a most important item in this connection is the fact that ice cream which is maintained in the proper temperature is very superior to ice cream served after it has been subjected to warm temperature and refrozen, and this fact should stimulate greatly the consumption of ice cream since it will give the consumer a better quality ice cream in all cases.

"We have always been of the opinion that the best asset we can have in building up our volume of sales is high quality ice cream and certainly this automatic refrigeration, in addition to being economical from a financial standpoint, will be responsible in building up our sales from a quality standpoint and this most important item we believe all manufacturers of ice cream should take into consideration."

* * *

G. A. Hoffman of the Galliker Ice Cream Co., Johnstown, Pa., says his firm has 35 iceless cabinets installed and finds that automatic refrigeration is "going to be a great relief in the future on several standpoints, as delivery and eliminating of water and ice on the floors to your customers. We certainly believe this is going to revolutionize our industry," he added.

* * *

W. R. Meier, president of The Fort Atkinson Creamery Co., Fort Atkinson, Wis., tells an interesting story about a snowstorm in which the cutting off of electric power did not keep his cabinets from doing their duty. He says: "We gave our first automatic refrigerator machine to one of our best out of town customers and he is pleased to state that we are perfectly satisfied with the working of this machine. We had a big snow storm the part of this week which put the power off for 26 hours at that little town. The customer was so well pleased with the machine that he called up by long distance and told us about the power being off in the town for 26 hours and the cream kept in fine shape.

"The advantages are everything in favor of the machine, disadvantages are none I know of. I think these automatic refrigerators are the best thing that ever came to the ice cream manufacturer and dealer. I won't be very pleasant until every dealer has a machine. But after every dealer has a machine it will be the direct delivery cost at least 75 per cent and even that happens we will all be happy. What we all want to look out for is how we place these machines to the dealer. I am writing this letter for a small manufacturer having around 100,000 gallons ice cream per year and everything delivered direct by truck."

* * *

MILTON A. PIPER, manager of the Piper Ice Cream Co., Muskegon, Mich., writes as follows:

"We buy the cabinet and without charge place it in dealer's store. He pays for the current, water and ice cooling his soda fountain coils. We usually find an agreeable to sign a contract for a period of years

Purity Cans Defy Brine

THE BRINE formed by the salt and melting ice in your ice cream shipping tubs and cabinets corrodes ordinary hot-rolled steel.

Years of retinning and repairing ice cream cans have taught us this.

As a result, O. & B. PURITY Ice Cream Cans are made entirely—bodies, bottom and covers—of specially prepared cold-rolled steel, heavily tinned.

Besides, every seam is electric-welded and soldered both inside and outside.

There are no rivets. PURITY cans cannot leak.

We have all sizes in stock. Write today for circular and prices of these high grade, practical cans.

COST accounting, insurance problems and sales promotion were important topics at the fourteenth annual meeting of the New England Association of Ice Cream Manufacturers, January 22 and 23. The convention, which was held at Boston, was conceded to be the best the association has ever held, there being a registration of 312, with a banquet attendance of 355. The Copley Plaza Hotel was convention headquarters.

A development of much importance was an organized step on the part of ice cream manufacturers of the New England states toward a safety campaign in the driving of ice cream delivery vehicles. This will come about, officials thought after the convention, as a result of the association's being informed that ice cream manufacturers will be classified according to accidents.

Members also are very hopeful for good things to develop from a conference of a committee of manufacturers and college men, created at the convention to carry on experimental work in handling ice cream so it may reach retailers in such a way as to get better sales effort and more profit.

A highwater mark for New England conventions was established. The registration consisted of 135 manufacturers and representatives. There were 107 suppliers operating in that territory, eight visiting manufacturers and 19 visiting suppliers.

Dr. James O. Jordan welcomed the association to

the city in the name of Mayor Curley who was unavoidably absent. The president responded.

Treasurer's Report.

Balance on hand January 1, 1923..	\$ 4,231.54
Receipts during 1923	10,710.94
Expenditures during 1923.....	\$ 7,073.09
Balance on hand December 31, 1923..	7,869.39
	<hr/>
	\$14,942.48 \$14,942.48

The secretary reported the year started with 59 active members, 4 lost by resignation and absorption, added 26 new members, making a total of 81 active members. At the beginning of the year there were 76 associate members, 6 were lost through resignation, 29 new members added making a total of 99 associate members.

Dues collected on the gallonage basis showed that over 9,000,000 gallons were collected for in the association. The association still has some money due that will raise this figure. From this and general knowledge of conditions in the industry in New England the committee figures that practically 15 million gallons of ice cream was made last year in New England. The treasurer's report shows an addition to the treasury of \$3,637.85 for 1923.

The secretary made approximately 100 visits during the past year to ice cream plants in New England and hopes to be able to visit all members this coming year.

Technical Bulletin No. 60

—issued by The Michigan Agricultural College

Quoting from this bulletin—

"The authors believe that the work presented in this paper represents what can be expected in a sanitary way from a commercial ice cream factory. This particular factory was chosen for this work because, to our minds, it represents an average up-to-date factory. The machinery includes two 500-gallon Elyria Glass-lined Pasteurizers, four 1000-gallon Glass-lined Elyria Holding Vats. The workers were not aware that any attempt was being made to check the sanitary quality of their work."

EVERY MANUFACTURER IN DIXIE SHOULD BE A MEMBER OF THE SOUTHERN ASSOCIATION.

The association, through its representative, W. H. Snow, has introduced a bill into the Massachusetts legislature for the registration of ice cream packages the same as milk packages.

Harry Tait said his company is running a safety campaign dividing their drivers into two groups trying to reduce their accidents. It was to appoint a committee to look up the whole insurance problem with the idea of launching a safe driving campaign in the association this year. This committee will be appointed immediately.

Howard Coonley, president of the Boston Chamber of Commerce, in an informal talk on "Industrial New England," sketched economic developments since 1921, told how residence in New England won him from Chicago, and suggested that to get New England thinking of work as the happiest thing in life, acting in this resolve as a great community, would overcome hindrances inherent in the situation today. Success, Mr. Coonley defined as "doing a piece of work, no matter how modest, better than it has ever been done before."

Following the war, the speaker said, the laborer wanted to be a mechanic and the mechanic wanted to be a great executive. People were dissatisfied with the work to which they had been accustomed. This discontent has been reflected in all lines of industry. The chamber of commerce is planning to "sell New England to New Englanders" and, incidentally, to stimulate communities to show a keener interest in work as the way to happiness.

Mr. Coonley's talk brought from President Slingerland the comment that there would be fewer mills moving South, fewer shoe factories going to St. Louis and the West, and less shipping through the port of New York than the port of Boston if more men like the presi-

dent of the chamber of commerce could be found to direct the industrial life of this section.

THE papers of both H. K. Leatherman and Arthur Lazarus on "Accounting Systems" and "Budgeting the Ice Cream Dollar" aroused interest. In the discussion of this James Tait said on the "Benefits of Budgeting" that they really now felt that they knew where they were on their work and that the results of this budgeting and accounting work allowed them to practically forecast the work for a coming year in a given month.

The subject "Good Business" by the secretary gave a picture of the industry 40 years ago, its growth and development today and pointed out the hard work that had been put in by men in developing the industry also that the largest development came after the development of associations where men got together and discussed their problems.

The paper asked each man what he had contributed toward building up the industry and asked new men coming into the industry whether they expected to come in and take everything or whether they expected to come in and give as well as take.

THE president said in part: "I feel that 1923 was a banner year for ice cream manufacturers, retailer and consumers of New England alike. The manufacturer was blessed with a large gallonage, the retailer enjoyed a correspondingly greater sale and the consumer purchased high quality ice cream at moderate prices. All in all, I consider the great 1923 family of New England ice cream manufacturers, retailers and consumers a happy, satisfied lot."

"Our association is one of which we can all be justly proud. I believe it is the most active and has accomplished more than any other of its kind, in the whole country. But though we have scaled many mountain great barriers still confront us and our watchword must continue to be 'progress.' We must continue to go forward with an ever increasing desire for further accomplishments. One hundred per cent of the manufacturers of our territory should be made members of our organization. So far as our industry is concerned, we should make of New England a great community. Having accomplished this, we should then create a 'community spirit which communes' for with the people. Any community holding aloof from one another nothing can be accomplished and this, of course, holds true with a community of ice cream manufacturers."

Doctor Downey's address on "Edible Gelatine" explained the use of gelatine in ice cream and should be of value in answering questions of the public.

Professor Judkins from his experience with judging ice cream brought out many points relative to quality and in summing up said that improvement in quality of ice cream would mean larger sales and suggested that the college people and the manufacturers get together and help find out the elements.

Professor Fisher talked on the experimental work in the ice cream field and gave some interesting and valuable data on the effects of different methods of homogenizing and handling the mix.

Professor Fuller brought out the point that there is much more food value in ice cream than the average person considered. This information should be available in sales talk.

After a discussion on "Why Such High Insurance Rates on Ice Cream Delivery Trucks?" Mr. Johnson introduced Mr. Whitlock of the Travelers' Insurance Company who told the meeting that the insurance rates on ice cream trucks were made on a general classification

Nutting

FLOOR Trucks

for the Ice Cream Plant

The big job in the dairy industry is to keep things moving! For this important work, Nutting Floor Trucks have proven themselves to be the simplest, cheapest and most adaptable means for handling milk cans, butter, cases of bottles, ice cream cans, etc.

Many Nutting Trucks are specially made for dairy use. Ask your jobber.

NATIONAL CONVENTION—NEW ORLEANS—NOVEMBER 17-20, 1924.

which was determined by the number of accidents in which ice cream delivery trucks participated. He stated that by reducing the number of accidents and the money that insurance people had to pay for accidents of ice cream delivery trucks that premiums would be dropped and offered his services to help the association in any work that could be done to reduce these accidents.

On Wednesday afternoon B. C. Larrabee, sales manager of the Sheldon Department of Burdett College of Boston, brought out in his talk on "Selling, the Man, the Job, the Goal" many fundamental ideas on selling.

A DISCUSSION of "How Can Retailers be Induced to Sell Carryout Bulk Ice Cream at a Price which will be a Profit and therefore lead them to push this Sort of Sale?" was led by P. S. Harmon of Simmons and Hammond and was probably one of the longest discussed and most actively discussed. It resulted in the following vote: That a committee composed of manufacturers and experimenters be appointed to get proper information relative to dishing and handling of ice cream, that this information be distributed, in order to help retailers get proper information.

This whole subject has been referred to the executive committee.

President Slingerland started the discussion on advertising under the following heads—newspapers, outside signs, inside cut-outs, window displays, billboards, special sales and packages.

E. H. Turner of the Boyd Ice Cream Company pointed out the difficulties encountered in making a service charge operative.

In the absence of O. S. Jordan, president of the ice cream supply men, the secretary read his paper on "How the Supply Man Helps."

On account of accident and sickness, the treasurer,

W. H. Snow, and O. S. Jordan were absent from the meeting for the first time since organization of the association. It was voted to send flowers to Mr. Snow with an appropriate letter and also to send an appropriate telegram to Mr. Jordan. These were sent immediately by the secretary.

The following officers were elected for the coming year.

President, G. B. Platt, New Haven, Conn.; Vice president, J. C. Tait, Springfield, Mass.; Treasurer, W. H. Snow, Somerville, Mass.; Secretary, W. P. B. Loe wood, Boston, Mass.

Executive Committee—T. S. Shannessy, Charlestown, Mass.; P. S. Harmon, Portland, Maine; H. B. Slingerland, Burlington, Vt.; C. F. Fearon, Manchester, N. H.; W. R. Libolt, Waterbury, Conn.; J. F. Kelley, Providence, R. I.; T. G. Hancock, Chelsea, Mass.; M. J. M. Namara, Brockton, Mass., and M. S. Kalashian, Worcester, Mass.—National Director, G. W. Kenison, Lawrence, Mass.

On taking the chair, President Platt spoke on "Cans and Cant's of Association Work."

All meetings and entertainments were well attended. The whole program; entertainment and banquet were under the direction of an association committee and from the expressions of opinion we believe were highly successful.

The first night there was singing, dancing and other special features. The second night, at our banquet, we had as guests, Lieutenant Governor Fuller, Mayor Cullen and E. F. Cullen of the Educator Cracker Company. 355 sat down to the banquet. In addition to this there were entertainment features and everybody had the best of good times. The presence of the ladies this year added not only dignity but color to the meeting.

The meeting received exceptional publicity from the press for which the secretary has thanked the press representatives.

Put This CREASEY Ice Breaker Where Most Convenient

With this individually motor-driven machine you can arrange your ice handling plant to reduce labor to a minimum.

A slow speed motor mounted on top of the machine drives the drum shaft by a generous size pliable belt, with an idler to adjust the belt tension. There are no noisy gears, with possibilities of misalignment, wearing of the bearings, catching of clothing, etc. The belt of the Creasey is entirely enclosed, protecting the operator and also protecting the belt. A cast-iron guard plate likewise protects the motor.

The belt drive has all the elements of safety, as the belt will slip before anything will break.

Our engineers will be glad to advise you regarding the best labor saving arrangement of your ice breaking equipment. State the kind of current you have available, that is, whether alternating or direct current, voltage, whether 1, 2 or 3 phase and the number of cycles.

Ask for Catalog R-1125.

GREATER SALES AND LOWER PRICES THROUGH ICELESS CABINETS.

(Continued from page 97)

to use our ice cream, and it is specified in the contract that he shall pay the charges above mentioned. In our opinion the minimum gallonage the dealer must sell to make this installation profitable is 750. We have found the power cost to the dealer is from \$4.00 to \$5.00 a month; water and service charges we have no data at present.

"We find most of the dealers will use their ice cream cabinet, that is already incorporated in their fountain for an ice box for soft drinks, and we install mostly our mechanically refrigerated cabinets at the ends of the various fountains.

"We have been rather firm with our dealers and up to the present time have not furnished them with data service. We make it perfectly plain that upon installation of the mechanical cabinets we expect to do away with ice and salt service altogether."

SOUTHEASTERN MANUFACTURERS EXPECT BETTER BUSINESS.

In sending in check to cover renewal subscription to The Ice Cream Review, B. B. Morris of the Meyer Dairy Equipment Co., operating from Birmingham, wrote "Ice cream manufacturers in the southeast are looking for better business in 1924 than they had last year."

"The usual presidential election year 'slump' will not materialize in the southeastern section of the U. S. among ice cream manufacturers and creamerymen this year, as everyone anticipates good business," Mr. Morris says.

A Bold Sweeping Offer

WOULD you like to receive an assorted dozen No. 10 cans of our ice cream fruits and flavors that are new to you?

A few of these products are listed in the coupon below. Have you ever tried Toasted Nut Paste, Butter Scotch, Black Walnut, Fig Walnut, Harvest-Moon Special and other items?

These flavors are being used by ice cream companies in all parts of the country. They are not experimental in any sense, but they may be new to you.

Here is our bold, sweeping introductory offer. Make up an assortment of one dozen No. 10 cans from the list in the coupon. If any item is unsatisfactory, you need not pay for that item. Deduct it from the invoice and remit only for those items that are satisfactory.

Fair enough? Then check your assortment in the coupon and mail it to us.

The Cleveland Fruit Juice Co.
Cleveland, Ohio

Manufacturers also of the celebrated Honeymoon Special, Maple Concrete, Black Walnut, Egg-Nog and many other flavors. Write us for complete list.

Mail Coupon to **THE CLEVELAND FRUIT JUICE COMPANY, Cleveland, Ohio.**

Carolínians Discuss Development of Consumption

Great Progress in Promoting Tarheels' Dairy Industry
Forecast at 6th Annual Convention

Record Attendance

A SPIRIT of determination to develop the ice cream industry of North Carolina was reflected in deliberations at the sixth annual convention of the North Carolina Ice Cream Manufacturers' Association. The convention, which was held at Winston-Salem, January 15 and 16, reflected a determination to engage problems interfering with the progress of the industry in that state, and open the way to what one speaker termed "the dairy development to which this state is entitled by natural conditions."

Among the outstanding topics of the sessions, which were held at Winston-Salem's magnificent Robert E. Lee Hotel, were "Increasing Consumption," "Growth of the Dairy Industry of North Carolina," "Promoting Winter Sales," and different discussions on proposed legislative matters for the welfare of the industry.

No action was taken with regard to North Carolina's ice cream pasteurization law, and the association also deferred action on adopting of a code of ethics.

The sixth annual convention was regarded by pioneers of the industry in that state as the most successful yet held. The sessions were largely attended, and the speeches were heard with interest. Lively discussions were heard when matters came up for general comment.

Election of W. S. Obenshain of Charlotte to succeed Charles E. Landreth as president of the association appeared to be the "finishing touch" to a convention that had been most satisfying to the members. Retiring President Landreth was supported by the new officers in the belief that the convention was "a victory for the cause of organization in the ice cream industry of this state."

Arthur E. Dixon came in for his usual share of glory for the efforts he has wielded, as secretary-treasurer, for the promotion of the industry through the association. Tributes to Mr. Dixon were paid in the president's annual message and in the address of George L. H. White, founder of the organization and highly regarded by his fellow "Tarheels."

Sentiment in its most impressive form crept into the convention during the brief moments the delegates heard the late John Wyatt Pope, former director, eulogized in resolutions introduced by the convention president's committee. The same committee conveyed sympathy to James H. and H. C. Baer in the passing of the lady who was the wife of the former and the mother of the latter. In his address, the convention president lamented the death of Mr. Pope as the passing of "a

true Southern gentleman who held courtesy and chivalry paramount."

The resolutions thanked the local press and the supplymen.

A LARGE number of delegates were present when H. R. Dwire, editor of the Twin-City Daily Sentinel, delivered the address of welcome. He told of his city industrial progress, and left a feeling of assurance in the minds of the delegates that they were welcome.

George L. H. White reviewed the progress of the ice cream industry since organization work has been underway, in his response to the address of welcome. He predicted better things for the future, pointing out that North Carolina's growth in milk production was rapid. He spoke of the importance of the association's policy of co-operating with the North Carolina Department of Agriculture.

Convention President Landreth's address teemed with a warmth of welcome that was impressive. A plea for fairness in business relations was voiced. He strongly recommended that the policy of holding regional meetings be continued, declaring that much good had been brought about in this way.

The activities of the organization during the past year were reviewed in the report of Secretary-Treasurer Dixon. A feature was the distribution of ice cream among 3,266 children in the state's orphanage on Thanksgiving Day. The secretary thought that the distribution of ice cream for that purpose in that way should be increased.

He discussed the national convention at great length. His report as treasurer showed the financial side of the association to be in good condition.

Dissatisfaction with North Carolina's pasteurization law was expressed at different times during the convention. In his speech James H. Health, director of the food inspection division of the department of health, said he wanted a clearer interpretation of requirements for pasteurization. He stated his opinion by quoting from an article in The Ice Cream Review by Prof. A. C. Baer:

"I was a little discouraged when the talk was made by your health department man when he stated that you backwatered—on the law you were trying to get through the legislature—and tell them that you want 100 per cent pasteurization or you don't want any at all, because the little fellow, the 25-gallon man, is the one

Meeting the Demand

A STEADY stream of Frigidaire Ice Cream Cabinets is leaving the Delco-Light Factory daily.

The Frigidaire Ice Cream Cabinet has met with the instant approval of manufacturers and retailers of ice cream. All are quick to see in it a money-saving solution of one of their most costly problems—the ice and salt method of keeping ice cream. For the manufacturer, it quickly saves its cost in eliminating the trucking and delivery of ice. For the retailer, it brings freedom from the muss and dirt of salt and ice, no shrinkage or return of soft cream, no cream too hard to serve, no repacking.

A Frigidaire Ice Cream Cabinet is adaptable to the varying conditions of different stores since the mechanism can be installed at either end of the cabinet—in the basement or elsewhere as desired. The large volume of inquiries and orders indicate a satisfactory reception of this new adaption of tried and dependable Frigidaire.

who ought to pasteurize. Your big ice cream factories pasteurize anyhow."

IN reviewing the growth of the North Carolina dairy industry, W. J. Shuford of Hickory gave the following interesting statistics:

Value of dairy products in the state.....\$14,912,000.00
Receipts from sale of dairy products..... 6,000,000.00
Average production of milk per dairy cow.... 310.00

Counties:

Cabarrus	Value	\$240,000.00
	Sales	130,000.00
Caldwell	Value	154,000.00
	Sales	59,000.00
Catawba	Value	330,000.00
	Sales	204,000.00
Cleveland	Value	367,000.00
	Sales	153,000.00
Cumberland	Value	87,000.00
	Sales	44,000.00
Forsyth	Value	520,000.00
	Sales	224,000.00
Guilford	Value	606,000.00
	Sales	385,000.00
Iredel	Value	365,000.00
	Sales	153,000.00
Durham	Value	264,000.00
	Sales	134,000.00
Mecklenburg	Value	662,000.00
	Sales	408,000.00

Total value butter produced in the United States in 1921 exceeded the value of cotton crop for that year, three times

the value of the tobacco crop, close to the value of the wheat crop. Figures for that year were:

Butter	\$649,000,000.00
Cotton	643,000,000.00
Tobacco	223,000,000.00
Wheat	747,000,000.00

The flush of butter production is from May to August. June is the peak.

The first creamery in the state was established about 1910, at Mooresboro, N. C., and later one was established at Liberty, N. C.

Production that year was around 100,000 pounds.

Probably 500,000 pounds butter used by the ice cream plant last year.

"OVERRUN Control" was the subject of a very informative address by N. M. Thomas, president of The Association of Ice Cream Supply Men's Salesmen's Club. The speech by Mr. Thomas, who is connected with the Cherry, Bassett, Winner Co. of Philadelphia, will be published in a subsequent issue.

Thomas C. Reed, assistant production manager of Chapin-Sacks Corporation, Greensboro, N. C., opened the second morning sessions with an address on "Raw Material Production." He said other communities less favored than North Carolina have made a success in dairy production.

J. G. Moore of The Pfaunder Co., Rochester, discussed the outlook for dairy development in the Southern states, declaring that there can be accomplished in the South what has been done in the great dairy states of the North, if the proper effort is made.

"Promoting Winter Sales" was discussed by a representative of a Detroit house. J. A. Arey of the North Carolina Department of Agriculture then spoke of "Progress Made in Dairy Development in North Carolina During the Past Ten Years," declaring that there is every reason to believe that the coming ten years will witness much greater strides than what has been made in the past.

A paper on "How Ice Cream Consumption Can Be Increased," prepared by H. P. Olsen, president of The Ice Cream Review, was read to the convention by Secretary Dixon. A representative of another publication discussed the subject of "Meeting Competition," stating that the most effective way is with a quality product.

The president's committees were announced as follows on the first day of the convention, and they made their reports at the final session:

Transportation committee—L. A. Corning, Salisbury; W. J. Shuford, Hickory; Charles E. Landreth, Winston-Salem, and T. C. Reed, Greensboro.

Entertainment committee—W. S. Obenshain, Charlotte; Charles E. Landreth, Winston-Salem; A. E. Dixon, Fayetteville; George L. H. White, Raleigh; Earl Wilson, Gastonia, and G. E. Wilkinson, Salisbury.

Membership committee—A. E. Dixon, J. C. Grimes, W. S. Obenshain and Charles E. Landreth.

Code of ethics committee—E. L. White, George L. H. White, A. E. Dixon and Charles E. Landreth.

Resolutions committee—Earl Wilson, T. C. Reed, Kiser and R. T. Smith.

Next convention city—Charlotte, January 13 and 14, 1925.

WIDELY famed for its entertaining features, the Carolinians eclipsed their past records at the 1925 convention. The end of the first day's session was punctuated with a dinner. This was followed by a trip to the R. J. Reynolds Tobacco Company's factory.

The order of procedure for the entertainment features was switched. Instead of having the annual banquet on the evening of the first day, as was planned

TAG HOOKS Save Dollars

Why use expensive, untidy, time-losing strings or wires while tagging your tubs or pails of ice cream?

SNAP 'EM ON

and use our rust-proof tag hooks.

SAVE TIME—Figure the cost of strings or wires. Then think of the value of a man's time while tying the tags on your tubs.

CAN'T RUST

Our new type of hooks are made of SPECIAL SPRING BRASS. They sell at \$1.95 per hundred, including staples. Besides a 10 per cent discount in lots of a thousand or more. Samples on request.

BARBER

Everything for the Dairy Industry

Ice Cream Plant Supplies

Chicago Perfect Can Liners

A necessity for ice cream manufacturers who desire to market their product under sanitary conditions. Made from heavy manila water-proof board that will not absorb any odor or taint from unclean cans. They protect your new cans and lengthen the lives of your old ones. Made in 1, 2, 4, 8, 12, 20 and 40 quart sizes.

Eclipse Cedar Ice Cream Tubs

Made of genuine everlasting white cedar, which will not water-log. Outlasts all other woods for ice cream tubs. The malleable drop handles and heavy hoops are galvanized to resist rust. Made in 2, 4, 8, 12, 20 and 40 quart sizes.

Ice Cream Brick Boxes

Various styles of boxes and cartons in pint, 25-cent and quart sizes, stock printed or printed to your order.

"Stay On" Tub Covers

A water-proof, brine-proof, mildew-proof guaranteed cover. Ties in front with metal-tipped tie strings. Oiled to harden the fabric and lengthen the life of the cover. Thoroughly shrunk before cutting to insure a perfect fit. Made in three grades in 4, 8, 12, 16, 20, 24, 32 and 40 quart sizes.

Galvanized Iron Brick Tanks

Made from heavy, cold-rolled galvanized steel. Double seamed and well soldered, reinforced to keep the body in shape. Capacities, 2, 3, 4, 8, 12, 21 and 40 quarts.

Whirl-I-Gig Ice Cream Trucks

Made of the best poplar, in cross layers, and fitted with three large double wheel ball bearing casters. Eighteen inches in diameter. A handy truck for many purposes.

Everything for the Ice Cream Factory

From the heaviest machinery and equipment to the smallest supplies. A large section of the Barber-Goodhue general catalog No. 79 is devoted to the needs of the ice cream factory. If you haven't a copy we shall be glad to supply you on request.

NORTH, EAST, SOUTH AND WEST—"REVIEW" IS LIKED THE BEST.

because of so many delegates having to leave on the evening of the last day of past conventions, the delegates attended a performance of Al. G. Field's minstrels the first evening. They were entertained at 1:30 p. m. the second day, at Cliffside Lake. This was on the outskirts of the city. Rain failed to dampen the spirit of the delegates. The barbecue, an old-fashioned, country-style affair, was served in the dance hall.

The closing session was held that afternoon.

The banquet on the evening of the last day was most enjoyable. Ellis G. Baum, who filled the place of Robert M. Hanes, vice-president of the Wachovia Bank and Trust Co., made a splendid toastmaster. A large number of ladies attended the banquet. Retiring and incoming officers made short talks. Souvenirs were distributed by supplymen. It was the verdict of different speakers that the banquet closed one of North Carolina's most successful conventions.

Power Consumption

Question of Speed of Ice Cream Freezer is a Vital Matter, Says Expert on Subject

By F. B. FULMER*

IN discussing "Power Consumption" in recent issues of The Ice Cream Review, some of the points may not have been clearly understood by the readers, and it is for this reason that it might be well to consider the subject again.

It is reasonable to presume that the experience, that suggested the power tests, was more or less common to all operators working under similar conditions. When using a belt driven ice cream freezer it was observed that

and speed demands during the freezing process, but owing to the more complicated starting and control devices, and a greater cost, they are very rarely seen connected to an ice cream freezer.

From the time that a charge of mix is placed in a freezer to the period when it is ready to draw, the process is divided into three phases; first phase, the cooling of the mix; second phase, the whipping period and the third phase, the freezing of the whipped mix.

near the completion of the freezing process the belt would have a tendency to slip on the pulley, causing the dashers to slow down, and it was not an unknown thing for the belt to come entirely off the driving pulley causing a complete shutdown of the freezer with all of the attendant difficulties.

When the belts were tight, excessive friction would result and in some cases bearings have burnt out.

When electric motor driven freezers were used, heating of the field coils and bearings was not an unusual occurrence and a decrease of speed resulted.

The question of speed in an ice cream freezer is a vital matter, especially when it decreases near the end of the freezing process. Practically all of the motors placed on freezers are of the constant speed class, as they are designed to operate at about the same rate of speed up to their rated capacity. In the past electric motors all had a reserve capacity to meet demands of an overload that might temporarily be placed upon them, but motors of recent construction have little if any overload capacity.

It is the writer's belief that the constant speed motor is not the ideal machine for supplying motive power for an ice cream freezer. The variable speed motor would more nearly meet all conditions that attend power

Practically all freezers are given a definite speed by the manufacturer which is supposed to give the required results and this speed is based on conditions prevailing at the end of the freezing period.

The more agitation that ice cream mix is subjected to, the more its consistency (or viscosity) is apt to be impaired, but this point appears to receive little if any consideration when a constant speed is applied throughout the time the mix is in the freezer.

As no particular advantage is gained by having a high rate of speed during the first phase of the freezing process, some saving of power could be effected if the moving parts were operated slower during that time. This would also tend to eliminate some friction and consequent wearing and proportionately prolong the life of the freezer.

Again, as soon as the finished ice cream is being drawn from the freezer a change of condition occurs and the longer the drawing period is prolonged, the more of the frozen product is apt to be beaten down. Tests of ice cream from the first drawn and the last drawn will demonstrate that there is considerable difference in the yield.

In order to arrive at accurate conclusions and check up on all periods of the freezing process, a set of electrical instruments were attached to the wires supplying

Use

Baird Refrigerator Bodies

With Iceless Cabinets

FOR use with iceless cabinets we build refrigerator bodies to carry ice cream only, and ranging in size from 200-gallon capacity for use on a Ford truck to 1,800-gallon capacity for use on a seven and one-half ton truck.

ALL BAIRD REFRIGERATOR BODIES, both old and new, built for servicing ice and salt cabinets, can be easily and inexpensively reconstructed to carry ice cream only. The insulated compartments now used for ice and salt can be adapted to contain ice cream under refrigeration. Thus the ice cream capacity of the body will be more than doubled.

In BAIRD BODIES the seams are welded and regalvanized after welding. By welding, the two pieces of metal are fused together and actually become one piece, permanently resisting vibration and preventing leaks.

Other 1924 improvements are thicker sheet metal reinforced with angle irons, regular refrigerator door fasteners, stronger hardware, and lighter and better hatch covers.

BAIRD REFRIGERATOR BODIES mean—3° below zero—light weight—perfect insulation—thorough waterproofing—and absolutely no brine dripped on the chassis, the street or in the garage at any time.

William F. Baird Company

OFFICE: 401 Chamber of Commerce, BOSTON, MASS.

FACTORY: WINCHESTER, MASS.

power to a 3 H. P. constant speed motor direct connected to a 40 quart horizontal ice cream freezer.

As noted in former articles there were variations in time and quantity of product obtained between the first freezing and subsequent runs, so all calculations are based on results obtained after the freezer had been operated for some time.

A study of the readings obtained, (which for convenience have been reduced to the nearest practical fraction of a horse power) demonstrates that there is nearly 1,000 per cent variation in the power demands between the starting point and the peak load just at the beginning of the drawing period. This is graphically illustrated by the chart and shows how easily a small or undersized motor could be overloaded. This con-

dition obtains with a normal amount of mix in the machine, while overloading the freezer would aggravate the condition beyond all reason.

The tests were conducted with a freezer that was in perfect mechanical condition: it is easy to conjecture what results would have shown had the bearings been out of line, the gears not in proper adjustment or the scraper blades distorted so as to produce undue friction.

Even though the scraper blades are always kept straight, they should be inspected at frequent intervals and the edges kept in proper shape by draw filing, as the friction caused by the scraping action will cause a wire edge to form and in some cases grooves also. When these are eliminated the freezer will wear longer and require the minimum of power to operate it.

Pacific Ice Cream Manufacturers Convention Proceedings

Important Trade Papers Discussed at Vancouver, B. C., Meeting

(Continued)

"What Should We Learn from the National Conventions" was a subject assigned to C. J. Alfred, president of the California & Southwestern States Ice Cream Manufacturers' Association, but due to the inability of Mr. Alfred to be present Fred N. Martin of Spokane was called upon to speak on this subject.

"The National Ice Cream Manufacturers' Association has become a far greater power in the country than many men realize," said Mr. Martin, "Its work in handling national legislation affecting ice cream and the conservative use of money paid to the national association by its members was shown in the reports rendered by officers of the association at the recent Cleveland convention. A great lack of interest has been shown by members, especially in answering a questionnaire sent by the secretary during the year that has handicapped the efforts of the officers to obtain reliable information concerning the industry and the opinion of manufacturers throughout the country. No member should need to be urged to respond whole-heartedly and promptly to requests of this nature emanating from the secretary's office, as it might mean failure to carry through a constructive program without such co-operation.

"I understand that the federal government contemplates the institution of a ten per cent standard throughout the country, which was recommended by the national association."

Sinclair Speaks.

Harold A. Sinclair of New York spoke upon "Getting Your Product Over to the Public" and in part, said: "Some people depend solely upon advertising and salesmanship to put their product into the hands of the buyer, but from the standpoint of the practical merchant,—the man who stays in business in spite of high manufacturing costs, low selling prices, strikes and numerous ills that business is heir to,—getting a product over to the public necessitates not only advertising and salesmanship; but calls for the combined efforts of the entire organization, from the boss down to the errand boy, to make an enterprise truly successful,—and that means to give the buyer a product that will net him satisfaction, and the seller a fair profit for his labor. When there is business accord, there is bound to be success." Mr. Sinclair's speech will be published in a later issue.

Eckstein on Trade Abuses.

"Trade abuses are caused by not being in close contact with your trade and depending upon salesmen and hearsay," said Nathan Eckstein, general manager of Schwabacher Bros. & Co., Seattle. "The buyer bears

down, but the salesman must bear up, because the average sales force is only too anxious to make it easy to get the order. Salesmen should be educated to the actual cost of production as this, in my mind will solve most of the trade abuses.

"The average outsider thinks the business he knows nothing about is the easiest and the average man in business thinks his is the hardest," he continued. "It seems to me that the ice cream business has grown as much as it can, but when you make people understand that ice cream is a food and not a confection there will be room for expansion.

"If ice cream is a food it should be sold everywhere that food is sold—the grocery store should handle it. The housewife buys everything else at the retail grocers—why not ice cream? The department stores are constantly enlarging their scope and offer another outlet for ice cream. This would all be additional business to that you now enjoy.

"Ice cream manufacturers should be familiar with food values being taught to the children in public schools, as many only think of ice cream as a luxury. A large majority of the grown-ups think likewise.

"Your association is no more effective than the members make it. The coffee association is spending a half million dollars a year to correct the wrong impression people have about drinking coffee. So will you be able to correct that false impression when your organization functions to the point of convincing the public of the truth about your product.

"You can help the dairyman by selling more ice cream at as low a price as is consistent with the right margin of profit. One of the greatest trade abuses is selling a product at a profit larger than is justifiable.

"You should equip the retail grocer with the necessary equipment to handle ice cream as I am sure you will find this outlet an entirely new one that will increase your gallonage.

"It has struck me as a great harm to your industry to have dirty looking wagons or equipment of any kind to deliver ice cream or any other food product. To properly impress the public your equipment should have a sanitary appearance.

"An association is the same as a savings bank to you in business. The association pays back for all the effort and energy that you put into it. You doubtless have abuses that we do not know of in other industries, but whatever they are, cut them out. Put out the best product that you can, at the right margin of profit and through the greatest number of distributors that you can find. The result will be a proportionate success.

Voordanger on Advertising.

Experience Is The Test for Iceless Cabinets

FROM the start, over four years ago, the Nizer organization has held to the principle that it is unfair to sell experimental machinery.

The Nizer Cabinet, therefore, was thoroughly tested in actual service before it was offered to the ice cream manufacturers. We feel a certain natural pride in the fact that for more than three years the Nizer Cabinets, every one, have been successful in the hands of our customers.

This record is unique in the refrigerating business. It gives the Nizer an endorsement which no other iceless cabinet can show.

Experience is the test—the only way an ice cream manufacturer can be certain that the money he pays out for iceless cabinets is an investment and not a speculation.

The strong position held by the Nizer, the pioneer, is today emphasized and made exclusive by the basic United States patents which have been granted to this Company.

In order to make it easy for the interested ice cream manufacturer to learn more about the Nizer, we give the accompanying partial list of Nizer users—companies which are among the leaders in their respective sections.

You will learn much by inspecting the Nizer installations in their territories or in any one of the 160 or more other cities in which our equipment is now operating. We will gladly tell you the nearest point.

We suggest, however, that it is best to come to Detroit where you may receive the full benefit of the accumulated practical knowledge of our staff of ice-cream and refrigerating engineers, and where you may inspect over 600 Nizer-equipped stores.

THE ICE CREAM REVIEW COVERS AMERICA LIKE THE DEW.

jeet "Advertising—Should it be Local or General?" Mr. Voorsanger said: "The subject your committee has assigned to me takes in every department of your business and I am firmly convinced that your advertising should be both local and general. Every manufacturer should dictate what his type of advertising should be, not leave it to someone outside of the industry and who is not familiar with every phase of the business." He then said:

"Get the message across that ice cream is good for children and that you are offering them a product that will make them grow and be healthy. See what Fleishman did to make the word 'vitamins' become nationally talked and known to everyone. Educating the public is the biggest question before the ice cream industry today. It can be done by your association teaching the food value in ice cream through schools and the money spent in that class of advertising will undoubtedly be well invested.

"The food value in ice cream is greater than any other food, but where can you go and gather any statistics on the industry to be used in this form of constructive advertising? Any agency you apply can gather statistics and data in abundance but they render you a biased opinion, recommending that you only use the form of advertising that they make the most out of. Your association should gather and compile this reliable information to be used by members in collective and individual advertising.

"An example of what advertising will do is to be found in the Purity Ice Cream Co., Newark, N. J. Before their plant was ready to turn a wheel they had advertised consistently through the papers and personal solicitation with the result that when they started manufacturing they had 350 new customers on their books to begin serving. There was an old established company in the same city, but both the old and new companies did a surprisingly good business which can be attributed to additional consumption, brought about through advertising by both concerns.

"In my opinion any effective advertising on ice cream should contain references to your association to develop a community interest. There is greater co-operation in the automobile industry than in any other. They show 1156

per cent increase in business, because they have co-operative competition in their business.

"To be as effective as the automobile industry ice cream manufacturers should have a paid secretary to handle any co-operative advertising. They should fix a standard of quality that would place the association members on a high plane in the eyes of the consumer. An emblem should be adopted that would connect the slogan "High in Food Value" with the name of each manufacturer privileged to use the association emblem. Advertising ice cream as a good food would help also. These ideas I have mentioned could be successfully carried out and from observation of other industries I feel sure would be very beneficial in the ice cream industry."

W. L. Macken, a prominent dairyman of British Columbia, consented to talk to the convention on the relations between the dairyman and the ice cream manufacturer. Among the important points brought out by Mr. Macken were the following: "The dairy farmer's business is the production of butterfat and your association is forming an increasingly large outlet for the surplus of our product. You take our butterfat in quantity at a time each year when we seek just such an outlet.

"The producer has not always considered the ice cream man as an important element to his existence but with the growth of your industry this impression is being reversed. We should have the greatest co-operation possible between the producer and members of your industry. Ice cream has been handicapped by being considered a luxury while milk is known as a necessary food, as well as cheese and butter."

President Robb spoke of the progressive policy of the Dominion of Canada in promoting the dairy industry and then called attention to the heavy tax imposed upon ice cream, which is four and one-half per cent. He said, "Ice cream has been judged a food by the U. S. government and during war times when other commodities using sugar were only able to get a small percentage of their requirements, ice cream was allowed one hundred per cent of former requirements.

Canadian Professor Discusses Dairy Instruction.

N. S. Golding, assistant professor of dairying at the University of British Columbia, was called upon for an expression of views concerning the ice cream industry and said: "The making of ice cream in the average university has been greatly handicapped by lack of necessary equipment to carry out experimental work. We believe that thorough investigation of ice cream and its manufacture through the universities and schools is a necessity as this class of work cannot be carried on by individual manufacturers of ice cream."

(To be continued next month)

Why Richmond Cedar Does Not Rot

The gigantic cedars from which Richmond White Cedar Tubs are made come from an immense swamp. These white cedars practically grow in water. Only a wood with tremendous moisture resisting qualities could survive in an environment like this. It's the natural saturation with resin that preserves this wood indefinitely. And it does not lose this quality when cut and put to commercial uses. Its lightness of weight and ability to resist moisture and great strength makes an ideal tub.

For fewer replacements order a quantity of these tubs now.

PROFESSOR BAER'S INQUIRY DEPARTMENT

Replies to Inquiries

Dear Sir:—We are having trouble to hold our ice cream down to 100 per cent yield. We find that we can do this by freezing a few hours after making the mix but such cream comes from the freezer rather watery and does not seem frozen stiff enough to ribbon well. Will this practice cause ice crystals? We have not noticed any.

We use a 10-34 mix, running perhaps a few tenths over both these figures. We are careful with this part of the work, as we believe this would be most apt to trouble us. Milk solids run from 10 to 10.5 per cent. We use about a 40 per cent cream, a 32 per cent skim condensed, 3 per cent milk and a few pounds of powder, never more than six in a batch of eighty gallons, depending on the other ingredients. We use 14 per cent sugar, .5 per cent gelatine, 60-cent grade, pasteurize at 145 degrees and viscolize a few degrees lower than this, at 1,500 to 2,000 pounds. All our raw material is of good quality and low acid. Hold the mix at 38 degrees until frozen. The following day we cannot get down to 100 per cent yield unless we run three gallons of mix in the freezer instead of five.

We have a Davis-Watkins 50-qt. freezer, No. 149. Dasher revolves at 180 r. p. m., a little slower than recommended. Would this cause too much whipping? We freeze at 8 to 12 degrees. We have a Torsion Balance Overrun Tester. Recently I determined to freeze the extra swell out. In half an hour it had gone up to 135 degrees and came down to 120 degrees only when I drew half of the charge out. Brine was 12 degrees.

Reply: Your experience is rather unusual, as most factories seem to have trouble the other way in not getting sufficiently high overrun.

It appears to me that your difficulty is in the manner of freezing rather than in the composition of the mix and your method of processing the mix. I would suggest that you try to freeze your cream in the freezer at a little lower temperature, consuming less time to freeze a batch. You stated you were freezing the cream between 8 and 12 degrees temperature. I might suggest that you reduce this temperature to about 6 to 8 degrees, completely freezing your batch in about ten minutes. Draw the cream at a stage where it will easily run from the freezer into your can at the same time having enough consistency so that it will pile up nicely in the can. I would not try to freeze the mix immediately after processing as you get a smoother cream by aging it at least twenty-four hours.

I would suggest that you might run a check on your overrun tester by counting the number of gallons of ice cream you freeze from a definite batch of mix. Your mix would weigh nine pounds to the gallon and if you get 100 per cent overrun your ice cream would weigh four and one-half pounds to the gallon, or twenty-two and one-half pounds to a five gallon can. After follow-

ing out these suggestions if your apparent difficulty is not satisfactorily handled, I suggest you write me again giving further details.

* * *

Dear Sir:—I would like very much to have you analyze our mix, and also suggest a mix using the same ingredients that you think would be an improvement over the one we have. We want to run about 12 per cent on butterfat.

90 gal. 3.5% milk.
30 gal. bulk condensed 8% B. F. unsweetened.
150 lbs. sugar.
3 pints vanilla.
8 lbs. gelatine.
135 lbs. Sweet butter.

Reply: You will find your mix analyzed below and the calculations given in table one. You will notice that while your mix figures out to test 12 per cent butterfat the total solids is low. You will also note that you are only using 11.2 per cent sugar, which is the reason for your low solids. You are using sufficient milk solids and the additional serum solids furnished by the condensed milk should give you sufficient serum solids. You can improve your mix, however, by using more sugar.

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
90 gal. or 774 lbs. 3.5% milk..	26.70	66.58	93.28
30 gal. or 270 lbs. 8% cond...	21.60	48.60	70.20
150.0 lbs. sugar	142.00
135.0 lbs. sweet butter	113.40	113.40
8.0 lbs. gelatine	7.60
3.0 lbs. vanilla45
1340.0 lbs.	161.70	115.18	426.93
Per cent	12.06	8.3	31.8
Per cent sugar.....	11.2

Many factories are now using 14 per cent sugar. This would make your total solids very close to 34 per cent and I am sure would give you a very satisfactory ice cream.

* * *

Dear sir:—We have read with a great deal of interest your answers to questions in The Ice Cream Review. We are buying our homo from a creamery and are paying a certain price per pound of butterfat over the Chicago price. For instance, let us assume that the price of Chicago butter today is fifty-one cents, we pay nineteen cents over this price for a pound of butterfat in 20 per cent homo. Figuring that in our mix, we use two hundred gallons or sixteen hundred pounds of 20 per cent homo. In this two hundred gallons there are 320 pounds of butterfat which costs us seventy cents per pound or \$224.00. In this we figure that we get approximately 114 pounds of milk solids. If we bought sweet butter at fifty-one cents per pound with sixteen per cent moisture

ure and one per cent casein, what would be the saving to us if we should viscolize ourselves, using the figures on the attached slip as a basis. Give us your opinion of the advisability of putting in the equipment we are figuring on.

Cost of equipment which would include holding tanks, pasteurizer and a three hundred gallon per hour viscolizer with a ten horse motor—\$7,000.

Reply: You are presenting a rather difficult problem for me to analyze for you. Without giving the matter a very thorough study, which I am not able to do at this time, it appears that the volume of business you are doing would warrant you to put in your own processing equipment. It is possible, however, that a very thorough analysis would not warrant you to do this.

In the third paragraph of your letter you mention that you are using 320 pounds of butterfat, costing you \$224.00 and that you are getting in addition 114 pounds of milk solids in the 20 per cent homo cream. If, as you suggest in the fourth paragraph, you were to purchase the sweet butter at 51 cents, the 320 pounds of fat would cost you 61 cents per pound or 196.80. The 114 pounds of milk solids would require 120 pounds of skim milk powder, which at 16 cents, would cost \$19.20, which would make the total cost \$216.00.

I think probably that you can figure this out for yourself better than I can as you know the weekly volume better than I do and you can then add the depreciation and interest on the machinery needed to install your own equipment.

* * *

Dear Sir:—I would like to have your opinion and advice on the following. You have already helped me very much in the advice you have given me, and in analyzing my mix. My mix is given below:

7.0 pounds sugar.
2½ ounces Gumpert's Textor.
2.0 pounds Skim milk powder.
4¼ gallons 20% cream.
¾ gallons milk.

I make a very good tasting ice cream, but it doesn't melt down as it should, so I would like to know if it would be advisable under my present methods to use gelatine in my mix. I have to mix each batch separately by hand as I freeze, and I have never used gelatine, and if it is advisable please state how you would recommend me, to mix same so as to get it dissolved uniformly.

Reply: I have your letter of recent date, relative to your present ice cream formula. I have analyzed your formula and you will find the figures below in table one. You will notice that you have better than 14 per cent butterfat, and your total solids are very high. This high total solids is the cause of your ice cream being too solid.

Table One.
Your formula.

Ingredients	Fat	Serum sol.	Total Sol.
7.0 lbs. sugar	6.65
2.0 lbs. skim milk powder..	1.90	1.90
35.7 lbs. 20% cream	7.14	2.54	9.68
6.4 lbs. 4% milk256	.55	.806
.16 lbs. Textor15
51.26 lbs.	7.396	4.99	19.186
Per cent	14.4	9.7	37.4

I also suggest that you would get better results if you would use gelatine instead of the comparatively large amount of improver. You can easily get the gelatine into solution if you will first soak the gelatine in some cold milk and then gradually heat it introducing it into your mix, stirring rather violently.

If you are going to make 14 per cent ice cream you can also reduce the total solids by either eliminating the skim milk powder entirely from your mix or using less than one-half as much as you are now doing. If you were to use 10 per cent butterfat or 12 per cent butterfat it would be all right to keep your skim milk powder in the mix.

* * *

Dear sir:—It has been a question with me for a long time what temperature the hardening room should be carried.

Reply: There is considerable variance of opinion among ice cream manufacturers relative to the temperature of the hardening room. I find that this has varied considerably, depending somewhat upon the method of hardening. A still air hardening room will require a lower temperature than a circulating air hardening room. Where a temperature of zero to 5 below zero would be a good average for a circulating air room, a still air room would require 10 below to 15 below for similar results.

In my opinion there is no advantage in having the room lower than 10 below zero, providing of course, it can be kept at that temperature. However, when a lot of freshly frozen cream is put into the hardening room late in the afternoon, it may be necessary to bring the room to 20 below zero so as not to have the temperature raise too much during the night, especially if the machine is not run for twenty-four hours.

The temperature of the hardening room should, if possible, not be permitted to go higher than 10 above zero, being better to have it not go higher than 5 above zero. An average temperature of zero kept up during the entire twenty-four hour period each day should be desirable.

* * *

Dear sir:—What constitutes "Better Ice Cream," or as some prefer to call it, Quality Ice Cream?

Reply: In order to make a high quality ice cream it is necessary to have three essential considerations. First, the raw material must be of excellent quality. In that connection I brought out the fact that ice cream made from sweet cream and sweet milk as a base, is better than ice cream made from a reconstituted product made from butter, powder and water. Very often the quality of butter is not such that a good uniform quality ice cream can be made.

The second factor is to have good sanitary conditions all about the factory so that no contamination will occur either to its flavor or to its healthfulness and purity, and that the bacteria count of the final product be as low as possible.

The third important factor is correct processing which includes thorough and efficient pasteurization followed by homogenization either through a homogenizer or viscolizer. Both cooling and aging of the mix at the right aging temperature. All these factors when taken together and carefully applied should result in ice cream of unquestionable quality. It is necessary, of course, that the mix be frozen correctly so that it will have the right body and texture, etc. All of these factors with the possible exception of the first, can be generally applied in any ice cream factory.

In Oklahoma and throughout the South and middle West it is not possible to secure the sweet cream and sweet milk and our factories in this section of the country must be extremely careful in the purchase of fresh, nice flavored butter and to use with it skim milk powder or condensed milk which is also in the best of shape.

The New Ucopco Trade-mark And What it Stands For

Ucopco Wheel

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

When filtered, the liquid Gelatine is hurried to these great wheels and after a single turn is dropped directly into barrels. Our patented process requires less than 5 minutes to dry Gelatine. The old tunnel drying process requires 16 to 48 hours.

Gelatine consuming industries have long been familiar with the UCOPCO Red Drum as it appeared in our advertising in the past. With the perfection of UCOPCO WHEEL DRIED GELATINE, it seems advisable to employ as a trade-mark a semblance

of the machine which has revolutionized gelatine making and so greatly improved the product. Let our new trade-mark, which appears on every barrel, be your guide in selecting gelatine. It stands for unparalleled purity and quality.

SOUTHERN CONVENTION—NEW ORLEANS—NOVEMBER 14-15, 1924.

1924 Will be Better Ice Cream Year

"Sound Business" is Outlined for the Ice Cream Industry,
Minus Inflated Conditions

By O. S. JORDAN*

GENERAL business conditions are considered by the secretary of commerce, our most studious economists, by labor leaders, heads of large companies and by the rank and file of the great army of industry and commerce, as being sounder at this time than at any other time since the war. There is not the inflated activity experienced a few years ago, but neither is there the prospect of a dangerous depression.

Although ice cream is in the fortunate position of being that middle-of-the-road commodity, a semi-luxury—and therefore, it has been noted that in business crises, it is affected to extremes either way only after a considerable pressure has been felt—it is, of course, dependent, finally, upon general business conditions. The favorable general conditions that appear in prospect for the year should certainly mean that ice cream also will have a good year.

Then comes the weather. Many men eminent in the ice cream industry believe that every fluctuation of the ice cream business aside from the major fluctuations that follow national business inflation and deflation are traceable to weather. It will be interesting to know some day, through the experimental work of the National Association of Ice Cream Manufacturers, possibly, something more about this.

* President, The Association of Ice Cream Supply Men.

Vilter Enclosed Type Ammonia Compressor

An ideal ice machine for the moderate size plant. Modern in design, made of high grade materials and thoroughly inspected and tested. Let us send a copy of our Bulletin No. 29R to you. It tells of the force feed lubrication to the piston pins, the easily operated Vilter plate valves, the oil sealed stuffing box and gives other information of value.

Let us submit quotations on your requirements
—no obligation to you.

The
Vilter Manufacturing Company

ESTABLISHED 1867

830 Clinton Street

Milwaukee, Wis.

There is, for example, an ice cream manufacturer in a certain city who has recorded year after year the effect of rain on ice cream consumption, the effect of an overclouded late afternoon and early twilight. This ice cream manufacturer knows, rather exactly, how many more gallons per thousand population are consumed at four o'clock in an afternoon at a temperature of 95 than are consumed at two o'clock in an afternoon with the same temperature. And at different temperatures. Seashore consumption of ice cream undoubtedly varies per thousand persons from high altitude consumption.

Yet, occasionally, some fluctuation, some queer little turn in the ice cream business, leads one to suspect that the weather is not the absolutely dominating factor. In these remarks I am deliberately passing over, but not forgetting, the effects of advertising, aggressive merchandising, etc., in promoting consumption in both seasonal and unseasonal periods. I am speaking of the weather as a fundamental controller of ice cream gallonage.

A careful, scientific and concurrent study of production figures and weather statistics in various sections of the country for a period of years might reveal that the ice cream industry need not forever watch the weather reports so anxiously.

EACH of us probably has his particular fond idea with respect to the industry in which he is interested. For myself I would like to see every ice cream plant a glistening monument to the ideal of sanitation. A greater emphasis is now being placed on the food properties of ice cream. Equal emphasis should be placed on the appearance of the plants. If the public is to regard ice cream as a food, the public—and I mean not merely special health officials, but the public as a whole, the little boy who buys a cone and the housewife who orders special creams—is certainly going to find itself directly interested in the places that food comes from. Child's restaurants with all their lavishness of tile should not exceed in whiteness and in spotlessness the appearance that the modern ice cream plant presents to the public that consumes its product.

I also will consider it a significant moment when a slogan is adopted by the National Association of Ice Cream Manufacturers and put in use by its members as a dignified and conservative combined promotion of ice cream consumption. Co-operative advertising of this description is bound to make a greater market.

THE general outlook among members of The Association of Ice Cream Supply Men is for a year of increased ice cream production, I am sure. A normally healthily progressing year. It is an insult to talk of quality to some ice cream manufacturers. They have built huge businesses on that very thing—quality of product. To other ice cream manufacturers it is not improper to speak of quality. I believe if the 125 members of The Association of Ice Cream Supply Men and the 800-odd members of its auxiliary Salesmen's Club—I mention these two groups because in their entirety they are doing business with the ice cream industry on a continental scale—it would be the overwhelming consensus that quality ice cream is what, (1) the public

Kansans Hold Lively Sessions

Report of Wichita Convention, Kansas Association of Ice Cream Manufacturers, January 22, 23 and 24

Hammond New President

MEMBERS of the Kansas Association of Ice Cream Manufacturers held their annual convention at the Broadview Hotel, Wichita, Kansas, January 22, 23 and 24. W. H. Chappell of Manhattan presided at all sessions, and B. T. Perkins of Pittsburgh acted as secretary.

There were 180 delegates registered, which consisted of manufacturers, supply men and visitors. Of this aggregate 80 were manufacturers, 75 were supply men, and 25 were visitors.

The program, compiled by Secretary B. T. Perkins and associates was varied and constructive and included papers by such well known men as W. A. Schwindeler, H. M. Jones, Professor M. Mortenson, and W. H. Hammond.

The morning session, January 22, consisted of the registration of members.

The afternoon session, January 22, was called to order at 2:00 P. M. by President W. H. Chappell. Earl G. Elliott, city manager of Wichita, welcomed the members of the association and visitors to the city. He invited them to see and feel Wichita's hospitality, but not to "taste it."

The address of welcome was responded to by President W. H. Chappell. In this response and address, Mr. Chappell touched on the statistics on the growth and consumption of ice cream in the past several years. It was plainly demonstrated that ice cream was fast coming into its own.

Sylvester Long of Wichita gave an address on "Mechanical Refrigeration," being a new subject to all hearers, a number of questions were asked and interesting answers were given.

The following committees were appointed:

Legislative: L. R. Manley, Henry Bennett and F. J. Crum.—Auditing: J. R. Fenner, St. Joseph, Mo.; J. A. McDonald, Junction City, Mo.; R. E. Smith, Independence, Mo.—Resolution: Ransom Bennett, Ottowa; E. D. Edquist, Concordia; and C. L. King, Hays.—Membership: R. E. Ambrose, Norton; Roy C. Kauffman, Pratt; J. D. McEwen, Wichita; J. M. Curriگان, Parsons; Percy Reed, Topeka; and Parriott, Atchison.—Nominating: Fred Myer, Kansas City, Kan.; Blevins, Arkansas City, Kan.; Martin, Topeka; J. B. Pottinger, Wichita; and Geo. J. Chapman, Cameron, Mo.

The remainder of the afternoon was given to round table discussion which was led by Geo. J. Chapman.

Morning Session, January 23, 1924.

Meeting was called to order by President W. H. Chappell at 11:15.

H. M. Jones, dairy commissioner, read a paper on "Quality of Ice Cream and what it means to Kansas."

Afternoon Session, January 23, 1924.

At 2:00 P. M. W. H. Hammond of Great Bend read

a paper on "Transportation." O. J. Gould, deputy dairy commissioner, spoke on ice cream cones, which created considerable discussion along sanitary line for dispensing ice cream cones.

N. E. Olsen, professor of dairying, Kansas State Agricultural College, gave an address on "Factors Influencing Yield of Ice Cream."

M. E. Garrison, secretary of Business Men's Credit Association, gave address on "Credits," which was commented on by all who heard it as one of the best credit talks that they had ever listened to in the way of handling credits. It seemed to arouse a great amount of interest. It is needless to say that if the Kansas manufacturers would follow Mr. Garrison's advice and suggestions the association would reap untold benefits to all members.

The paper written by W. A. Schwindeler was read by A. R. Fernald. Mr. Fernald also gave a side discussion on advertising.

The morning session of January 24, beginning at 11:00 A. M., was devoted to executive session. Fifty manufacturers were present at this meeting.

At 1:30 the afternoon session of January 24, was called to order by President W. H. Chappell.

Marion N. Waldrip of Kansas City, delivered a very interesting, as well as entertaining talk on "Present Day Topics."

Professor N. E. Olsen of Kansas State Agricultural College gave an address on "Factors Responsible for Desirable Texture in Ice Cream." It was very interesting to all listeners.

Committees reported as follows

A communication from the Jack Rabbits Association was read: "Kansas Ice Cream Manufacturers Gentlemen:

The Jack Rabbits in session today unanimously voted to extend to the local entertainment committee J. B. Pottinger, W. H. Snyder, and B. Copely their hearty thanks and appreciation for their work and cooperation in putting over so successfully the entertainment Wednesday evening the 23rd, also, to express to the Kansas Ice Cream Manufacturers Association the thank of the Jack Rabbits for their attendance and moral support in making this an evening long to be remembered."

PETE MILLER,
CHARLES SMITH.

The resolution committee reported as follows:

"RESOLVED, That the eighth annual meeting of the Kansas Association of Ice Cream Manufacturers in union at Wichita, Kansas, January 22-23-24, 1924, do hereby extend a hearty vote of appreciation to the following who have been responsible for making this convention one of the best and most enjoyable in its history To the officers and committee of the association To the Kansas Jack Rabbits.

To the Wichita manufacturers and their ladies

ZERO BUILDING

Woburn, Mass.

To all those who have taken part in the program.
To the management of the Broadview Hotel.

Respectfully submitted,

F. R. BENNETT,
E. D. EDQUIST,
C. L. KING,

Resolution Committee.

An invitation came from the chamber of commerce from Topeka that the next annual convention be held in their city. It was read as a motion and seconded that Topeka be chosen as the next convention point. The vote was taken and carried.

The auditing committee consisting of J. R. Fenner, J. A. McDonald and R. E. Smith, reported the financial statement furnished by the treasurer as correct.

L. R. Manley, legislative committee, made a report on legislative matters concerning express rate which was ordered raised by the express company and later rescinded.

A motion was made and seconded that secretary write the utilities commission in regard to the express rates.

The nominating committee reported as follows: The nominees for vice-president were voted on by members present which resulted in J. F. Crum being elected.

A motion was made that the remaining report of the nominating committee be received and nominees declared elected.

No other business appearing, the president declared adjournment, until the annual banquet at 6:30, which was presided over by A. R. Fernald, president-elect of the Kansas Jack Rabbits. At the close of the banquet

Mr. Fernald introduced officers-elect of the two organizations for the coming year. Marion N. Waldrip of Kansas City then addressed the guests with a very interesting and entertaining after-dinner speech which was followed by the annual after-dinner ball, when all adjourned well pleased, declaring their intentions to meet each other at Topeka next year.

MINNESOTA CREAMERIES CONTRACT WITH HEATHIZED BUTTER COMPANY.

Representatives of the Heathized Butter Co. of Baltimore, Maryland, recently contracted with the Minnesota Co-operative Creameries Association of St. Paul, for an additional regular supply of "heathized" butter. After careful consideration by the executive committee of the association, contracts were entered into giving the association the exclusive right for its members to manufacture "heathized" butter in Minnesota. In addition, the association has also the exclusive selling rights for "heathized" butter in the cities of St. Paul, Minneapolis, Duluth, Rochester, Albert Lea, Mankato and St. Cloud.

There are 27 creameries in Minnesota making butter by the heathized method and shipping it to distributors mostly in Cleveland, Baltimore and Newark, who hold exclusive selling franchises for the selling of "heathized" butter in their respective markets. It is noteworthy that the Heathized Butter Company recognized the superior quality of sweet cream butter, which they claim can be improved in flavor and keeping quality by making the butter according to the "heathized" process.

It is expected that the co-operative creameries of Minnesota will obtain additional outlets for their sweet cream butter. In 1923, approximately nine million pounds of butter was heathized in Minnesota. This quantity will be vastly increased during the current year, especially in view of this present contract now entered into between the association and the Heathized Butter Company direct.

The contract with the Heathized Butter Company will become effective immediately on any additional quantities of "heathized" butter for which the Heathized Butter Company finds an outlet. Upon the expiration of the present contracts of the co-operative creameries with the Heathized Butter Co., the association's contract will become effective. All co-operative creameries are expected to continue to "heathize" butter until the expiration of their contracts, after which time the association will handle the butter for them. The association will pay the royalty for the creameries and assist in the supervision of making sweet cream "heathized" butter.

DETROIT OFFICE READY.

The Detroit office of the Armstrong Cork & Insulation Company are now prepared to handle contract work for the insulation of steam lines and other power plant equipment, brine and ammonia lines, brine coolers, tank etc. Nonpareil High Pressure Covering and Nonpareil Cork Covering are carried in stock in Detroit. Office and warehouse are located at 453-7 Fort Street, West Detroit, Michigan.

Anyone who studies the advertisements in this paper does not have to be told that it is a profitable habit. It collects the profits daily.

Michigan Manufacturers Break Thru Snowbanks

Record Attendance at Michigan Dairy Show in Spite of Severe Weather. Convention Celebrating Fortieth Anniversary of Michigan Allied Dairy Association is Great Success.

ICE cream manufacturers of Michigan joined with other branches of the Michigan Allied Dairy Association and marched on Kalamazoo in the face of a record snow storm, making the annual gathering of that group one of the most remarkable in the association's history.

The Michigan convention was set for the week of February 4. Snowbanks turned back most of the delegates the first two days, but when the weather lifted and the "iron trails" were cleared, delegates would not be denied. Attendance actually was greater than for the past year, when the Michigan gathering broke all previous records.

It was a fitting manner in which to celebrate the fortieth anniversary of one of the most useful organizations in the dairy industry. Ice cream manufacturers, creamerymen, cheesemakers, milk plant operators and dairy farmers were there in large numbers.

Although the snowstorm held back the attendance long enough to interfere considerably with the first two days of the program, members of the Michigan Dairy Boosters were on the job early, and their annual banquet came off as per schedule on the evening of the first day, Monday, February 4. President C. J. Yuncker presided. The secretary-treasurer, C. J. Smith, made very favorable reports.

The Michigan dairy show has long been one of the outstanding events on the dairy calendar, being ranked by some as right next to the National Dairy Show and the ice cream exposition. This year's show was up to all past standards.

OFFICERS and directors were elected for the Michigan Association of Ice Cream Manufacturers as follows:

President, L. S. Wilson, Wilson Ice cream Co., Port Huron, Mich.; director to National Association from Michigan Association.

Vice-President, Arthur Francke, Francke & Sons Saginaw, Mich.

Secretary-Treasurer, W. H. Bechtel, Caro, Mich.

Directors: Glenn P. Cowan, Arctic Dairy Products Co., Detroit; N. J. Desert, Detroit Creamery Co., Detroit; A. E. Williams, Williams Bros., Saginaw; L. Freeman Freeman Dairy Co., Flint; A. Francke, Francke & Sons Saginaw; J. J. McDonald, Arctic Dairy Products Co., Detroit; J. Kelly, Kelly Ice Cream Co., Grand Rapids; L. S. Wilson, Wilson Ice Cream Co., Port Huron; Vance Piper, Piper Ice Cream Co., Grand Rapids.

The Boosters re-elected their officers.

Convention speeches will be published in subsequent issues of The Ice Cream Review.

Michigan Dairy Show Draws Much Interest

THE NUMBER of attendants at the exhibitors' hall of the Michigan convention was a surprise to all. For the state exhibition to draw so many interested visitors, with the snow seven feet deep in some parts of Michigan, indicates that the Michigan Dairy Boosters have established a real reputation. All exhibitors were well pleased with the interest shown.

Solar-Sturges Manufacturing Co., 838 West Congress St. Chicago, displayed the Solar milk cans with a heavy, all-seamless breast, non-crushing top "that stands the gaff." Forged steel handles are welded onto the breasts of the milk cans and according to appearances, this can is durability plus. The famous Ultra and TIN-OKEH ice cream cans were also displayed. The company was represented by D. W. Shie Hillsdale, Mich.

A. H. Barber-Goodhue Co., 300 W. Austin Ave., Chicago, exhibited two 60-quart U. S. ice cream freezers, Milwaukee filler and capper, Titan separator, Rice & Adams can washer and Nafis glassware. These well-known products attracted much attention, and O. E. Harwood, Lester Sedin, A. J. Camptar, representatives of the company, were kept busy demonstrating them.

L. B. Woods and C. J. Yunker, both of Toledo, represented the Zipp Manufacturing Co., 747 Woodland Ave., Cleveland, Ohio. Crushed fruits, vanilla extracts and concentrates were displayed. Placards suggested that manufacturers of ice cream "Take a tip, buy from Zipp! Highest Quality for 15 Years."

The J. B. Ford Co., Wyandotte, was represented by F. Horn, F. D. Marenttete, W. Bruggema, H. J. Provond and C. W. Lange, who recommended Wyandotte sanitizing cleaner and cleanser to visitors, pointing out that it "protects the fine quality of ice cream products by the sweet, wholesome, sanitary cleanliness it provides throughout the plant."

The low duty bottle washer and the medium duty can washer, cans, and small equipment were exhibited by the Rice & Adams Corporation. Orlando A. Adams, president of the company, G. E. McFadyen, Chicago, and J. H. Constantine, Buffalo, were in attendance. We are advised that the representatives were "well pleased with prospects obtained at the show."

The well-known line of Dry-Zero equipment was displayed by the Dry-Zero Insulation Company, with offices in San Francisco, Chicago and New York City. M. M. Rosenberg was in attendance. This company will ship a Dry-Zero universal cabinet, subject to approval after test is made in manufacturer's plant.

Booth No. 49 was in charge of George J. Langtry, representing the Morton Salt Co., with offices in most of the large cities in the country. Others in attendance were Otto Hueth, E. Enright, A. C. Skibbe, W. R. Church, J. R. Turton and J. Radio.

The new improved Mulholland side walk sign was an attractive feature in the booth of the John H. Mulholland Co., 13 Chestnut St., Philadelphia. Flatwood spoons, Mulholland sanitary printed and lined ice cream plates, the new all-metal flavor sign, and other general advertising necessities for the season of 1924 were also on exhibit. The company was represented by John H. Mulholland and Howard W. Black.

Everhot, "America's Brand Makers" of Maywood, Ill., had an attractive exhibit with A. C. Flothow in attendance. Trade marks or designs can be reproduced with Everhot printing outfits.

Two ounces of Mapleine, manufactured by the Crescent Manufacturing Co., Seattle, Washington, added to ten gallons of finished ice cream, brings out a depth of flavor equal to maple itself, according to claims made by E. G. Hamel, Michigan sales agent, McMullen Bldg., Grand Rapids, Mich. Sixteen to twenty cents' worth flavors ten gallons of Mapleine cream. A small two-ounce bottle makes twelve quarts of delicious syrup, according to the manufacturer.

Emery Thompson Machine & Supply Co., 271 Rider Ave., New York City, exhibited a 40-quart horizontal motor driven ice cream freezer, with automatic batch regulator, equipped with the new fruit funnel, the large cream valve, three-blade dasher and double action spaddle and many other desirable features constitutes this modern machine. E. Cutler had the opportunity of explaining these features

"For making ice cream of perfection,
Which the gods and goddesses adore,
David Michael's powder Mexican
Is being used—more and more."

The above is the result of a poetic inspiration of a member of the David Michael Company, Front and Master Sts., Philadelphia, Pa. Eli Rosenbaum was in charge of this company's exhibit. Why don't you manufacturers take advantage of the liberal proposition offered by this firm? All you need to do is place a trial order, use all you need to give you a fair trial, and if this trial does not convince you that "Michael's Mexican Vanilla Powder does not produce the finest vanilla ice cream you ever tasted, return the remainder at the expense of the David Michael Co." Fair enough, isn't it?

* * *

The Citrus Products Co., 54 E. Kinzie St., Chicago, served ice cream and ices made with the well-known Kist Fruit Flavors to the visitors at the Michigan convention. One of the features of their exhibit was the advertising campaign that they have prepared for use by the buyers of their products. This campaign has been welcomed with enthusiasm by ice cream manufacturers all over the country, it is reported.

* * *

The new 300-gallon unit, known as "The Elyria 300 Special," was exhibited by the Elyria Products Co., of Elyria, Ohio. This is a standard stock machine, completely equipped with necessary accessories for proper operation as a milk or cream pasteurizer, batch mixer, or buttermilk machine and with brine circulation, it can be used for storage of dairy products. P. J. Cochrane, Elyria, and R. E. Conley, Detroit, were elated over results of their exhibit. They say an ample stock of these machines are ready for immediate shipment from the factory.

* * *

The exhibit of the Berney-Bond Glass Co., Clarion, Pa., was in charge of V. G. Harris, 4046 Blaine Ave., Detroit, Mich. Business was reported as very good. Orders were booked for milk bottles and for cottage cheese jars. A great deal of interest was manifested by dealers in the cottage

VIKING—The Practical Pump

For pump users who demand dependability and economy of operation.

The VIKING is self-priming and delivers a steady stream under varying heads. This eliminates all splashing and pounding.

Only two moving parts—no valves, springs or other trouble-makers.

cheese jar, and the company believes that in time virtually all the cottage cheese will be handled in glass jars.

* * *

The six specimens of butter receiving prizes were salted with Diamond Crystal Salt, according to claims made by the Diamond Salt Co., St. Clair, Mich. This firm was represented at the Michigan exhibit by James J. Hill, Saginaw S. A. von Jasmund, St. Clair, and J. D. Kirkwood, Port Huron, Mich.

* * *

A complete line of vanillas, pure fruit flavors, concentrates, emulsions, custards, real sherry and rum flavors for the ice cream manufacturer were exhibited by the Virginia Dare Extract Co., Inc., Brooklyn, N. Y., with Walter Murray in charge of their booth. Mr. Murray claims that his company makes "the famous double strength pure extracts which will stand all tests in flavoring ice cream." Samples will be sent on request.

* * *

A 3-ton twin-cylinder, noiseless, ammonia compressor, and series brine storage tank system for milk and cream cooling was on display in the booth of the X L Refrigerating Co., 59th and Honore Sts., Chicago. The company was represented by Raymond G. Hilger and Frank E. Burhaus.

* * *

The exhibit of the Lansing Paint & Color Co., Lansing, Mich., was conducted by C. A. Butts and A. W. Smalley, who were well pleased with their exhibit in general. A large amount of new business is reported by this firm, and meeting old customers was enjoyed by the men in attendance. A complete line of paints and varnishes is manufactured by the Lansing Paint & Varnish Co., and they specialize in dairy and ice cream paints, such as moisture-proof and fume-proof white enamel, can and tub enamel, wagon and truck enamel as well as floor paints and exterior paints. The company invites the opportunity of helping solve paint problems, and they urge the ice cream manufacturers to avail themselves of the help of their staff of experts.

* * *

Massey & Massey Co., Chicago, displayed a complete line of vanillas, true fruit concentrates, extracts and colors. A. Kline represented the company.

* * *

F. F. Lowenfels' Son, dealers in butter, 348 Greenwich St., New York City, was represented by Albert Lowenfels.

* * *

Prosperity ammoniated cleanser was the attraction in the booth of The Detroit Dairy Supply Co., Detroit, Mich. It is the claim of the company that prosperity ammoniated cleanser has proven that it will eliminate all cleaning worries, and it is urged that dairy products manufacturers give the product a trial in order to convince themselves of its merits. A complete line of dairy equipment is handled by this firm, among them the Elyria glass-lined equipment. According to W. H. Snider and A. B. Dumring, representatives in charge of the exhibit, the Detroit Dairy Supply Co. maintains an efficient engineering department to assist in dairy-plant layout and equipment-installation problems.

* * *

The visitors to the attractive exhibit of the John W. Ladd Co. were made familiar with the merits of the Rogers' brush maker, the viscolizer, and other Ladd equipment. Those in charge of the booth were F. H. Harwood, John W. Ladd, A. Grove, W. G. Mason, Geo. W. Rohrbeck, D. G. Kerch and R. S. Ellwanger, all of Detroit.

J. A. CAULDER IS NEW PRESIDENT OF WESTERN CANADA ICE CREAM MANUFACTURERS' ASSOCIATION.

At the annual meeting of the Western Canada Ice Cream Manufacturers' Association, held in the auditorium of the Y. M. C. A. last month, the following officers were elected:

President, J. A. Caulder, Moose Jaw; vice-president, J. W. Carlyle, Calgary; secretary-treasurer, F. L. Martin, Winnipeg.

The following board of directors was re-elected: Saskatchewan: J. A. Caulder, F. M. Logan and W. Helm.

Alberta: J. W. Carlyle, A. G. Archibald and E. Love.

Manitoba: J. R. Nesbitt, W. A. Irish and F. Martin.

STOUT-Schroeder ICELESS Cabinets

Vital Topics Discussed by Ohio Manufacturers

Association Adopts Constitution and By-Laws After Reviewing Conditions in Trade
Most Successful Convention on Record

Schubach Elected President

CREDITS, cabinets and consumption were outstanding topics at the annual convention of the ice cream branch of the Ohio organization of dairy products manufacturers. Discussion of increased consumption related chiefly to advertising methods. The event was further marked by adoption of articles of incorporation, the body formally incorporating under the name of the Ohio Association of Ice Cream Manufacturers "for the purpose of collecting and recording statistical information relating to the ice cream trade; adjusting and settling, in a proper and equitable manner, controversies, disputes and differences as to contracts, accounts and other disputes that may arise; guarding, protecting and promoting the general interests of the ice cream trade in Ohio; the collection and distribution, without charge, of scientific data relating to the manufacture of ice cream, to increase and promote a general spirit of usefulness of the industry to the public."

It was further provided in the articles that property be acquired at Columbus for establishing headquarters for the association.

The convention was largely attended, and goes down on Ohio records as the best the Ohio association ever has held.

Confidence was the keynote. Optimism was expressed over the outlook for the industry.

The Banquet.

Wednesday evening, at the close of the Milk Dealers and Creamery Operators' conventions, the entire body including the ice cream manufacturers and suppliers gathered in the dining hall of the Columbus Athletic Club for the annual banquet. Boys, it was a real banquet, pulled off in real style—but there was plenty to eat, too. The Columbus Glee Club, consisting of about 30 voices, furnished a part of the entertainment during the meal, followed by a playlet, "The Food Circus." This was conducted by school children of Columbus under the auspices of the National Dairy Council, and while the play is very interesting and amusing, it stresses the point that milk is a good food, and when combined with lots of fresh air and exercise, and other good food, makes for healthy boys and girls. Following this number of good singers and comedians entertained, pulling off a few hot ones on some of the members of the associations.

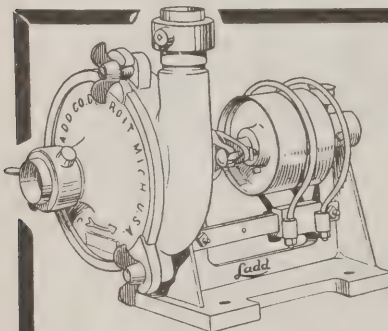

U. S. Senator S. D. Fess of Ohio had been invited to speak at this meeting, and made the trip from Washington to Columbus for this purpose. His address was one that mere written words could not do justice to. He explained the situations of the different powers in Europe, how since the close of the war various attempts had been made by the great powers to bring about satisfactory and feasible reparations settlement, and so far have failed. Europe, as Senator Fess views it, is in a period of terrible strife and distress, their people are unemployed, their governments are on the verge of bankruptcy, and he points to this condition when he says that America must take part in the European situation only in such a way that she will not be obligated in any way, that might endanger the peace and happiness and prosperity of her people.

On immigration, Senator Fess' words were "We don't want to offend anybody" in our immigration regulations. In June of this year the present restriction on immigration expires, and it is Senator Fess' desire to supersede the present rules with new ones that will bring the scum of the old world, and permit no man to enter who would violate the American Flag, or denounce the constitution of the good government under which we live.

The remarks of Senator Fess touched the hearts of everyone. His trip to Columbus, although made at a time when he was badly needed in Washington, was time well spent. He has enlightened and made better citizens of the dairy products manufacturers of Ohio.

At the close of Senator Fess' address, M. D. Munn, president of the National Dairy Council, was called upon. Mr. Munn spoke very briefly for he did not want to interrupt the thoughts left in the minds of his audience by the previous speaker. Mr. Munn merely brought out that the producers and manufacturers of dairy products are engaged in an industry that is vital to the well being of the nation, that without these dairy products we would not enjoy the health and happiness we do today.

Review of Ice Cream Manufacturers' Sessions.

THE first regular session included the usual address of welcome, president's address, and report of the secretary and treasurer.

In the afternoon Oliver S. Jordan, president of The Association of Ice Cream Supply Men, was scheduled to speak. Mr. Jordan, however, had been confined to his home on account of illness, and was unable to attend. In his stead, Thos. J. Stewart of the C. Nelson Mfg. Co., president of the salesmen's club extended the greetings of The Association of Ice Cream Supply Men to the Ohio association. Mr. Stewart called attention to the fact that the past two years the supply association held its exhibit in Ohio, and he believes the manufacturers in that state have shown their appreciation by their attendance at the show. He offered the services of the association to the Ohio manufacturers, urging them to get in touch with the New York office where there is any way the organization may be of assistance.

Dr. Thos. B. Downey, who is conducting experiments in gelatine for the Edible Gelatine Manufacturers Association at the Mellon Institute of Industrial Research in Pittsburgh spoke on edible gelatine. His address was similar to that given at the Pennsylvania and Ohio meetings, which was published in a previous issue of The Ice Cream Review. The address was illustrated with the usual lantern slides.

Publicity.

WHAT Can Be Done By Association Publicity?" was the subject of Bert D. Strang of Columbus. Mr. Strang had given valuable assistance to the Ohio association in securing space from the Ohio newspapers for news pertaining to the dairy interests of Ohio and their convention. He spoke of the opportunity the ice cream manufacturers have to secure for their industry publicity, to get the attention of the public to it, through the medium of the local newspapers. News of any kind that would be of more or less general interest, such as the establishment of new plants, changes in ownership, addition of equipment, sales records, etc., are usually given due consideration and published if presented at the editorial offices.

Mr. Strang also urged more generous use of different forms of advertising, bill boards, newspaper space, signs, electric signs, etc. He believes the dairy interests are not doing the advertising they should, in comparison with others. He cited the milk business for example, stating that only \$1.00 was used for advertising out of \$100.00 of sales; for advertising cranberries, the proportion is \$1.00 to \$250.00; and Coco Cola, \$1.00 to \$5.00.

Mr. Strang mentioned the advertising of a Philadelphia ice cream manufacturer who wanted to increase the consumption of ice cream during the winter months. Advertising will overcome, to a great extent, obstacles that may otherwise hinder the increase in sales. Years ago, he said, many people bought tooth paste because they liked the taste of it; nowadays, they buy it because it is good for the teeth. He is, himself, using a tooth paste that is everything else but pleasing to the taste because the advertising introduced him to give it a trial, and he is convinced it is the best he can obtain for his teeth.

At the close of Mr. Strang's address, Mr. Ross of Columbus offered a resolution, the substance of which was that the sympathy of the members of the association be offered to John H. Mulholland of Philadelphia, because of the recent loss of part of his plant by fire,

and to congratulate him on his ability to conduct business as usual and fill his orders in spite of the loss. Mr. Mulholland has attended the Ohio convention for many years, and has a host of friends among the members of the association. The resolution was unanimously adopted.

(To be continued next month)

Resolutions Adopted at Ohio Convention

Resolutions were passed requesting a formation of a bureau of dairy industry; for additional funds for the Ohio experiment stations in order that they may extend experimental work in the manufacture of dairy products; that no change be made in the present tariff on vegetable oil; that the Mellen tax bill be approved; that the University of Ohio, and Professor Stoltz, be given thanks for the work they have done for the ice cream industry of Ohio the past year; that similar thanks be extended to Mr. McWilliams, dairy and food commissioner, and to Dr. Downey, who spoke on "Edible Gelatine," to Secretary Wentworth, for the intelligent manner in which he handled the business of the association the past year, and to Mr. Loewenstein, secretary of the National Association, for the part he took in the program.

Officers for the next year were elected as follows: President, John Schubach, of Canton; Vice-President, Everett Antrim, Columbus; Treasurer, George Horen, Toledo.

Suppliyemen Organize.

Suppliyemen attending the convention held a special meeting on Friday morning and organized under the name of the "Buckeye Boosters," with the following officers: President, Howard W. Black, John H. Mulholland Co., Philadelphia; Secretary-Treasurer, E. H. Hood, Jr., John W. Ladd Co., Cleveland. Directors are: E. O. Miller, H. H. Miller Industries Co., Canton; G. P. Gundlach, F. C. Mathews Co., Detroit, and C. C. Kemp, Swift & Co., Chicago.

MINNESOTA GOPHERS ORGANIZED.

The Minnesota Gophers, is an organization formed at the recent convention of the Minnesota State Association of Ice Cream Manufacturers. C. A. Gould, Gould Cream Co., Minneapolis, is president; R. N. Palm, Creamery Package Mfg. Co., Minneapolis, is vice-president; H. E. Stinchfield, Gould Cream Co., Minneapolis, is secretary; W. M. Booth, Crescent Mfg. Co., Minneapolis, is treasurer.

The secretary's office is at 720 Temple Court Bldg. The executive committee consists of C. A. Gould, R. N. Palm, W. M. Booth, H. E. Stinchfield, Walter M. Paulson, E. A. Postlewaite and W. C. Hoeltje.

The slogan of the organization is "Gophers for the Minnesota State Association of Ice Cream Manufacturers."

H. E. STINCHFIELD.

Putting Ice Cream Over the Home Plate

(Continued from page 11)

California every week make, what they call, "a super-quality brick ice cream" of the same flavor combination. "Special order" creams are used. The manufacturers included in the family brick organization operate under a quality standard, being required to maintain certain requirements as to quality and cleanliness.

ADVERTISING has done its share to put over the plan. These manufacturers have spent more than \$100,000 in advertising what they call their "Perfect Ice Cream." This advertising built up the reputation of the product, but the manufacturers themselves are sure that this reputation never could have been gained without first making the best product possible.

The family brick now is sold from Santa Barbara to Old Mexico. It is known in any and every neighborhood in Southern California. The quantity makes it possible for these manufacturers to supply the quality family brick at a nominal price. In fact, it is marketed at the same price as the regular run of ice cream.

The following well-known Southern California ice cream manufacturers are co-operating in producing the family brick: Alfred's, Christophers, Crescent, Hughes, National, Globe, Excelsior, Imperial and San Pedro.

The advertising program includes a very handsome, strikingly illustrated booklet containing ice cream recipes. This booklet goes on to explain many different ways by which ice cream can be served in the home. Of course, it explains to the housewife why she should not make her own ice cream, but how through buying it from the dealer she can serve it at home in any way she wishes with the aid of cocoa, fruit, nuts, cake, pie, syrups, coca cola, and in most every tempting form imaginable.

Following is an excerpt from the family brick Products Company's ice cream recipes.

Ice cream is good enough in its ordinary dress for any occasion, but there are times when the housewife does want to "put on" a little additional airs for her family for special occasions or maybe for the company. The ways of using ice cream for dress-up occasions are numerous and one will find on concentrating for a little while a score or more methods of

using ice cream in such a way that while the basic principle is still ice cream, the guests get an idea of an expensive or complicated dessert. Ice cream is nutritious and can be given to children as soon as they begin to eat any foods other than a strictly milk diet. It should be remembered, too, that one or two items can be omitted from the meal when ice cream is served, due to its high food value.

A very good luncheon or supper may be made of ice cream and cake. It will be found that ice cream costs considerably less than many of the foods which we strive for and insist upon considering necessary to a well-balanced menu.

THE FAMILY brick campaign is a co-operative movement, and it well emphasizes what may be done in the way of co-operative advertising in the ice cream industry, though, of course, a national co-operative effort of this kind could not be done on exactly the same plan. However, the Southern Association of Ice Cream Manufacturers was wise in seeing that co-operative advertising must be based upon a certain standard of quality, and moved in that direction.

IT IS interesting to study what has been done in Southern California and to watch the development in the plans of the Southern Association of Ice Cream Manufacturers in their co-operative advertising progress, in view of the fact that the National Association of Ice Cream Manufacturers is working out plans looking toward the launching of a national ice cream advertising proposition. Committees to study the matter were put to work at the annual convention at Cleveland last October. These committees will consider national ice cream slogans as well as national advertising, uniform accounting, standardization of equipment, and other matters.

"Has your new son-in-law any livestock to begin farming with?" inquired the village gossip of Uncle Jeremiah Snodgrass.

"Well, he's got my goat," replied Uncle Jeremiah as he gave the off-horse a vindictive cut and went rattling out of town.

McCANDLESS HAS MORE TERRITORY.

W. D. McCandless, who has for a number of years represented the Jensen Creamery Machinery Company of Bloomfield, N. J., and Oakland, Calif., in territory adjacent to Columbus, Ohio, is now extending his direct and supervising sales effort to more distant territory, particularly that known as "Chicago."

Through the present and new distributing facilities of the Jensen Creamery Machinery Company, it is possible for Mr. McCandless to give his personal attention to some points as far west as Omaha.

Mr. McCandless reports some quite large sized and interesting sales having been closed recently, and he feels sure the trade will be interested in knowing that the new glass lined, vertical coil, square type Jensen equipment plays an important part in the new plant of the Bowman Dairy which will shortly be opened in the city of Chicago. Further, that his company is now manufacturing equipment for the new plant of Blue Valley Creamery Company, which is to be located on Jackson Boulevard, Chicago.

Installations of this type by the Jensen Creamery Machinery Company are the results of a number of years of close observation on the part of the users which have resulted in many of the large and recent up-to-date installations becoming equipped with Jensen machines.

Mr. McCandless's home address will still be 25 East Third Ave., Columbus, Ohio, but about half of his time will be spent in the Chicago territory.

Don't let that used machinery of yours stand in your way. Turn it into cash by advertising it for sale in the "Review" Want Department.

NORTH, EAST, SOUTH AND WEST—"REVIEW" IS LIKED THE BEST.

Southern Convention Proceedings

(Continued from February issue)

What's Dumber Than a Dumbbell?

By HARRY A. CUSCADEN*

WHEN Mr. Clopton wrote that he would like for me to speak on "Co-operation," I felt highly honored, but my first impulse was to say, "Nothing doing." After thinking the matter over I decided that I would be showing the association very little co-operation to refuse. You know in order to receive co-operation, you must give it. So here I am and no matter how rotten my speech may be, you all have got to listen to it.

It is hardly necessary for me to go into the details of what co-operation is, or what it will do for you in your every day life or in your business, you know that already. The big question is, "How can you obtain it?" First, you must have confidence, trust and belief in yourself and your fellowmen. Remember the Golden Rule, "Do unto others as you would have them do unto you." Learn to "give" and "take." Be a good winner and try to be a better loser. Don't be a hog and try to take it all. I remember a lesson I was taught in the second or third grade.

The story was about a tramp walking along a country road and a very wealthy man came along in his carriage. The tramp stopped him and asked for food or money. The man said, "yes, hold your hat and I will give you some money, but remember, all that falls to the ground will immediately turn to dust, so be careful." With that the man started dropping gold coins into the tramp's hat, soon the hat was brimming full and the man said, "I think that is about all your hat will hold." Then the tramp begged him for just a few more and the man dropped in another handful. The old hat gave way under the weight and all the coins dropped to the ground and before the tramp could recover a single one, they all had turned to dust, then the man in the carriage drove on. Be satisfied with your share boys, there is plenty here for all of us.

We all know that co-operation is right. But, in our fight for right, we must have "courage." When you know that you are right, then go to it, regardless of what the other fellow is doing. You have pledged yourself to co-operate, then have the courage and the backbone to back it up, if for no other reason other than it is right. Don't be afraid. Fear will paralyze you. Fear, if unchecked will bind a man as completely as if he were

tied with steel cables. You all know this is true, as you have no doubt at sometime or other experienced the effects of fear.

You have often heard this remark, "Why, I wouldn't believe that bird on a stack of Bibles, how can I trust and have confidence in him?" Just remember this, when he thinks he is fooling you by putting over an unfair deal, he is only fooling himself, and he must pay the penalty. Pentlay? Is there a penalty? I'll say there is. We have all been guilty of a little wrong in our lives. When that did happen, was it necessary for someone to tell you about it, or reprimand you for it? No, you had a strange feeling, felt a little worried, couldn't sleep sound, sort of lost your appetite. Still you weren't sick, what was the trouble? I'll tell you, it was that big little man inside, called "Conscience," continually whispering, "Aren't you ashamed of yourself, you've done wrong to your fellowmen." How many of you would pull a shady deal at the cost of a "Guilty Conscience?" Think it over, boys, and let it penetrate.

Some men have made the Almighty Dollar their God, and in their fight for it, they have cast aside everything, forgetting that their friendship and honor were at stake. How foolish, why there is nothing that can make a man more wealthy than his friends and his honor. Remember, when honor is gone, nothing else matters.

Boys, let's all go back just a few short years to the time when we were all kids, just happy kids, at home with father and mother. Mother, isn't that a beautiful word? The sweetest word in the English language. I heard a story on "Loyalty" not long ago and it impressed me deeply. It was loyalty to your mother. It dealt with a young man who had made up his mind to go to Europe. He didn't mention it to his mother, but went on for several weeks winding up his affairs and making arrangements. He bought his tickets to New York and arranged for his passage on the steamer and had everything set to go.

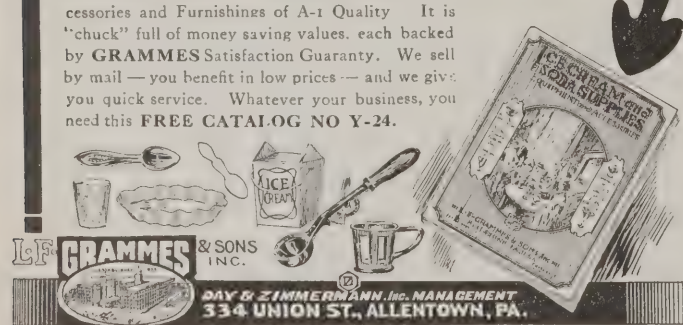

The day before he was leaving, he went to the dear old lady and said, "Mother, I am going to Europe tomorrow." "Well, son," she said, "I don't quite understand your leaving home so suddenly. What are your reasons?" "Well, I am older now and I want to see some of the world and learn something. I am in a rush here and I'll never amount to anything going along this way." "My boy, mother loves you, please don't go." "Well, why?" "Simply, because I ask you. I don't feel just right about your going. Remember, mother knows what is best." So the boy canceled his trip and stayed at home. A few days later he read in the paper where the train which he had expected to leave on for New York was wrecked and nearly all on board were killed.

You may wonder what connection this story has with my subject. It shows that mother is right, as she always is. Who keeps harmony in the household? When you and the kid brother got into a quarrel over a game of marbles in the back yard, who was the arbitrator? On any difficulties that came up, mother was there ready to adjust matters and make everybody happy. What was she doing, boys? She was giving you your first lessons in co-operation. You can't deny that. And now

we are all men and we cannot forget that mother was right. If co-operation was taught us in our homes by our mother, then now, today, co-operation should be and is the "Mother of Our Industry."

So far, I have failed to say one word about ice cream, or that good old state, Kentucky, or the Gateway to the South, Louisville. I won't take up much of your time telling about Kentucky, because you all know that is where the most beautiful women in the world are born. You might think that I am taking in a lot of territory, but I'll repeat, I said the world. And then, too, our horses. Oh boy! how they can run. I won't say anything about the B. V. D. times, because I don't want to make anyone thirsty, but that old Kentucky bourbon would sure make a preacher lay his Bible down. There is one more thing we can add to that already famous list and that is ice cream. What it takes to make good ice cream, we just happen to have.

It will no doubt be interesting to you to hear about some of the wonderful things we have done in Louisville.

Just a year ago, there was not a very friendly feeling existing among the Louisville manufacturers. There was absolutely no co-operation and only one or two were willing to try to co-operate. The result was, a price war and ice cream went to 90c per gallon and stayed there for three months. Conditions were growing worse and feeling was at a white heat when it was rumored that the price was going to 75c. It was necessary that something be done, and at once. To call the boys together and try to adjust matters was out of the question. Each one thought the other a liar and had not a bit of confidence in his competitor's word or promise. We decided that we must get an outsider, a disinterested party to handle the situation, so we called on a supply man to take the job. You are all no doubt familiar with the story of "Aladdin or the Wonderful Lamp," how he worked everything by magic. I just want to say that Aladdin didn't have a thing on this supply man. He's the greatest little fixer I ever met. Inside of three days we were selling ice cream at a fair profit and six weeks more conditions were again improved. He created the confidence among us which was lacking, he taught us how to "give" and "take," made us have courage and forget the fear which had so long been our stumbling block. Whenever there was a complaint registered against any one of us, and there were plenty of them for a time, he neglected his own business and ran that complaint down to the very bottom. And I am glad to say that in nine cases out of ten the manufacturer was right and that the dealer or customer was simply trying hard to put one over.

This past summer was one of real profit and business pleasure and all Louisville manufacturers are indeed grateful to our supply man leader.

That man is a member of this association and the association should feel proud to number him among their membership. He is fearless and impartial and as a leader in anything he puts his hand to he will surely make it a success.

What we did in Louisville, you can do if you will just have confidence in your fellowmen.

Co-operate in your home, with your employees, with your dealer, with your supply man and by all means with your competitors. If you do, he will cease to be a competitor and will soon be your companion.

In summing up, I have ten good rules to follow:

Co-operation, Mother of Industries.

Confidence in your fellowmen.

Give and take, don't be a hog.

Courage—to carry out all obligations.

Fear—no man and

The penalty of

A guilty conscience will not haunt you.

Protect your honor at any cost.

Be loyal in all undertakings and

Success will surely follow.

In closing, I wish to thank Mr. Costa and Mr. Clifton and the Southern association for this courtesy extended me and our Kentucky delegates. I am sure it has been a pleasure and I hope in some little way my message has been helpful.

To conclude, I will say to the man who does not believe in co-operation to the fullest extent, he is hopeless and wins the distinction of being "Dumber Than a Dumb-Bell."

* * *

Professor A. C. Baer of Stillwater, Oklahoma, was introduced next. Space does not permit publishing Prof. Baer's paper at this time. The speech will appear in a subsequent issue.

At the conclusion of Prof. Baer's address, President Costa stated that an invitation had been extended to the members present to attend the luncheon of the Lions Club at 12:15. As the time was up, he asked that Mr. Barritt's address be withheld until afternoon. This being agreeable, the meeting adjourned.

2:00 P. M.

President Costa opened the meeting, and introduced Dr. Garrison of the Arkansas State Health Department.

Dr. Garrison was asked to make a short address, and said in part, as follows:

"As health officer of this state, I am very much interested in this meeting. You gentlemen know your business better than I can possibly know it. I want to say that I will be glad to co-operate with you in any measure for the best health of this state. I am equally favorable to both the big man and the little man. I am against either of them, if the food does not conform to the laws and the best health of the state.

"I am with you to build up a standard that both you and the public will appreciate. I would like to bring up three points with reference to ice cream, pasteurization, standardization, and its value as a food. If you can educate the people to appreciate the value of ice cream as a food, you will increase your sales tremendously. Many people consider ice cream a luxury, and do not appreciate its food value. In the last session of the Arkansas legislature, a law was passed requiring pasteurization of ice cream only. This was intended to correct conditions.

"I think we should have a law requiring all milk to be pasteurized. The main problem we have, is the lack of funds to carry out these pasteurization laws. We are going to have trouble carrying out these laws until we get through a period of adjustment. I want to state that there is seldom anything of importance happening in the state of Arkansas that does not come to the state health officer for advice.

"It is important for a health officer to always give correct advice, but I am with you to increase the quality and the sale of ice cream. I shall be glad to render any assistance that I can. I am with the big man, as well as the little man, in carrying out any measure for the best health of the state."

Earl W. Hodges of Little Rock was next introduced, his subject being, "A Hot Bunch and a Cold Business." Mr. Hodges stated that he thought it unfair to have a man talk before this body of producers when he did not produce anything himself.

"I am a consumer," he said. "You know more about your business than I ever will know, but I know more than I did when I came into this room. First of all,

ADVERTISING IN THE ICE CREAM REVIEW IS A GUARANTEE OF MERIT.

I want to say that the City of Little Rock, and the state of Arkansas welcomes you here.

"We are glad to have you among us in this association. We have thought Arkansas the greatest state in the union for so long, and talked about it being the finest state in the Union until the average Arkansas man actually thinks it is the greatest state in the Union: but it is not. It has the material from which it can be made the greatest state in the Union. Arkansas has more natural resources than any other state, but we need people from the North, East, West and South to help develop these resources, thereby making this the most progressive state.

"We need you all. We welcome you to Arkansas. We are thinking too much of our ancestors in sitting there and not trying to develop our resources. I have a lot of ancestors—God bless them—I was born up here in the northern part of Arkansas in the mountains, but must live in the present and not in the past."

Mr. Hodges continued his address in a very pleasing manner, and held the undivided attention of the audience. He stated that we needed to develop our race and to build better schools and churches. Mr. Hodges' address was received with much applause.

W. P. Barritt of Tampa was next on the program, his subject being: "The Advisability of Carrying More Than One Grade of Ice Cream." Mr. Barritt's speech will be published in a subsequent issue of The Ice Cream Review.

Next on the program was W. E. Drake of Nashville, Tenn. Mr. Drake stated that he had not prepared a paper, and made a few remarks as follows: "I do not think it advisable to carry more than one grade of ice cream under the same trade mark. I think it best not to bring two grades of ice cream before the minds of the public, for no matter if you give them the best,

the suspicion will be there, that they are getting the cheaper grade." After some discussion between Mr. Drake and Mr. Barritt in this connection, Mr. D. W. C. Yarborough of Birmingham was introduced.

Mr. Yarborough's subject was, "Is a Charge Account on Empty Containers Practicable?" Mr. Yarborough stated that he had not prepared a paper, and would only discuss this subject briefly. He stated that empty containers should be checked so that they can be kept account of, but that when you can prove the failure of the shipper to return a tub, it is more important to force him to pay for this tub. It was a sense of Mr. Yarborough's address that such a charge would not be practicable. At this point, the secretary was asked to read a letter from Mr. Barnes of Selma, Alabama, who was also slated for discussion on this subject.

George A. Boedeker was next on the program to discuss, "Iceless Cabinets." Mr. Boedeker being unable to attend the convention on account of sickness, his paper was read by the secretary.

Mr. Boedeker's speech was the same as delivered at the Texas convention, and will appear in a later issue of The Ice Cream Review.

Byron Morris was next introduced, and was asked to make some remarks on behalf of the ice cream supply men. Mr. Morris made a short talk, asking for the cooperation of the manufacturers with the supply men and assured them that the supply men were always ready to give any information or to lend any assistance possible.

A. E. Dixon of Fayetteville, North Carolina, was next introduced, with the following subject, "Should there be a Unanimous Ice Cream Law for all Southern States." Mr. Dixon being unable to attend the convention, his paper was read by the secretary, as follows:

Should There Be a Uniform Ice Cream Law for All Southern States?

By A. E. DIXON*

THE manufacture of ice cream has established itself as one of our leading industries, not only from an invested capital standpoint, but is undoubtedly our most popular one, with young and old. The representative manufacturers of our country are striving to maintain and increase the public patronage, by various methods that would involve a great deal of discussion. It is needless to say that those manufacturers deserve great praise for their efforts to place before the public a pure and wholesome article of diet, and the example of those large and progressive manufacturers are emulated by the smaller ones drawn together by convention.

Every manufacturer of ice cream knows that it is composed of weights of different ingredients suitable to the ideas that hope to gain patronage by the superior quality of the product. It is easily understood why the great dairying sections of our country can maintain a high legal standard for ice cream as compared with sections where the dairying industry is in its infancy and conditions for its progress are less favored. This applies especially to the Southern states, many parts of which are not suitable for dairying, and consequently, the main ingredient, milk, has to be imported. This applies locally to most of our Southern states.

By referring to the table of legal standards as published recently by the Dairy Division of the U. S. Department of Agriculture, I call your attention to the

standards of the Southern states, including Oklahoma and Kentucky, on plain ice cream:

Alabama 14 per cent; Arkansas None; Florida 14 per cent; Georgia 8 per cent; Oklahoma 10 per cent; Tennessee 8 per cent; Virginia 8 per cent; Kentucky 10 per cent, (Change pending); Louisiana 10 per cent; Mississippi 8 per cent; North Carolina 8 per cent; South Carolina None; Texas 8 per cent.

A recapitulation of these percentages gives six states at 8 per cent, three at 10 per cent, two at 14 per cent, and two are non-standard. These figures apply only to butterfat, and do not refer to other ingredients the legal standards of which vary as widely as the butterfat. This chaotic variation of standards makes an irritable state of affairs especially on inter-state shipments among these states. These thirteen great states representing almost one-fourth of the U. S. and bound together by historical and geographical ties, could arrange for a simple, single standard, whereby all could come together on a common ground, doing away with the difficulties of the present system. A uniform law would simplify matters with the departments of agriculture of the various states, and the enforcement of the statutes would become easy and most economical. Having the combined efforts of these states on a single object would eliminate those who do not comply with the

* Secretary, Southern Association of Ice Cream Manufacturers.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

laws, and care nothing for the higher ideals of those now interested in the welfare of the industry.

A great many people are of the opinion that owing to an excess of milk products in certain sections of the United States, that there cannot be a national standard, but there is another view:—If the consumption of ice cream continues to increase, especially in the South and East, the importation of milk products into these sections, will equalize the supply, thereby forcing those who now favor a high standard, to join with those who are now manufacturing under a much lower one.

At one of the recent conventions, a member of the resolutions committee, feeling that some definite action should be taken along the above line, presented the following resolution, which was killed in the committee:

“RESOLVED, That the efforts of this association be directed toward the presentation of a proper national standard for the manufacture of ice cream.”

In conclusion, it would be a splendid piece of constructive work, if your convention would endorse and arrange for a conference composed of one representative ice cream manufacturer and the commissioner of

the department of agriculture of each state, making a committee of 26 who could simplify our present regulations; promulgate and present to the different legislatures for favorable action, a simple uniform law covering the manufacture of ice cream in our beloved Southland; a law so wise, that even a layman could see the wisdom of its enactment. The final report of the committee of 26 to be presented, if necessary, to each state convention for approval and ratification before presentation to the legislatures for consideration. Necessarily, a program of this kind would require time, and deliberation. The committee would secure data from experts and other available sources and I feel sure that the movement once started would immediately attract the attention of the entire country, and make the 13 states, leaders in an attempt to do something for the industry that is worthy of consideration.

North Carolina pledges full co-operation not only for a movement of this kind, but also for the general good of the industry.

The proceedings of the Southern convention will be continued in the April issue of The Ice Cream Review.

WASHINGTON	MAINE
News From Far and Near	
CALIFORNIA	FLORIDA

Decatur, Ala.—The Decatur Ice Cream and Creamery Co. is having a new addition erected to its building on Bank Street. The new annex is to be used for additional cold storage facilities. It was stated by J. W. Clopton, president of the company, that several hundred gallons more of cream can be stored in his plant when the new annex was completed.

Huntsville, Ala.—A contract has been let by the Huntsville Ice Cream Co. for construction of a creamery plant on W. Clinton St., to be equipped with all modern machinery, at a cost between \$12,000 and \$13,000.

Blytheville, Ark.—G. E. Barnes of Forrest City, Ark., has purchased the Layman Ice Cream Factory.

Ft. Smith, Ark.—Transfer of the Watson-Aven Ice Cream Company plant here to Joe M. Ward, manager and owner of the Ward Ice Company, has been announced.

Jonesboro, Ark.—The A. J. Scott Ice Cream Co. received at its annual meeting the report showing the most successful year's business in the history of the company. A 10 per cent dividend was paid the stockholders.

Little Rock, Ark.—The Hillcrest Ice Cream Company and the Runyan Creamery, Inc., have been merged to form a new company, capitalized at \$125,000, which will be known as the Runyan Creamery, makers of Hillcrest ice cream. The new organization plans to operate both plants in their present locations, manufacturing both ice cream and butter. H. A. Wilson is superintendent.

Walnut Ridge, Ark.—The Moore Ice Cream Co. has added \$3,000 of new equipment to its plant here.

Marysville, Cal.—Frank Avello has left the Star Ice Cream and Butter Co. and will go into the same business for himself. As soon as location is found, he will install a modern up-to-date plant, it is reported.

Greeley, Colo.—The Greeley Creamery Company has just installed another 6½x6½ York compressor, which doubles their refrigerating capacity. D. B. Bier, manager of the plant, says the outlook for 1924 is exceptionally good. The creamery has started the manufacture of American cream cheese, and also is making butter and ice cream and handling market milk.

Dover, Del.—Hill Mill Dairy Products Co.' will soon begin manufacture, having recently been incorporated for \$30,000 by Thomas J. Hilliard, Andrew G. Milner, William Hagenlocher and H. T. Foster, Erie, Pa.

Bristol, Ga.—Another cheese factory has been established in Sullivan county, according to a statement made recently by County Agent H. P. Bird. The new factory, which is capitalized at \$1,500, is located at New Bethel, four miles from Piney Flats near the Watauga river.

Columbus, Ga.—A concern incorporated in Georgia to manufacture ice cream and dairy products has leased the old

St. Mary's church buildings and grounds on Third Ave. and 17th St. Machinery for making ice cream and ice will be housed in the improved building as early as possible.

Chicago, Ill.—The Egan Ice Cream Co. has incorporated with a capital of \$175,000, the incorporators being James D. Murphy, Andrew G. Raithel and Maurice G. Walsh.

East St. Louis, Ill.—Beck Doyle Co., 1401 State St., manufacturers of ice cream and confectionery, incorporated with capital of \$10,000. Incorporators are Jacob Beck, Frank C. Doyle and Mrs. Jacob Beck.

Gibson City, Ill.—A factory is to be built here for the manufacture of artificial ice. The Gibson City Ice Cream Company expects to have the machinery in readiness to begin by May 1.

Indianapolis, Ind.—On January 8 an ammonia tank at the Williams' Ice Cream Company's plant exploded and caused two other tanks to burst, wrecking the entire plant and injuring six people.

Boone, Ia.—Messrs Brunner Brothers and J. F. Sammin purchased the Peerless Ice Cream and Butter Co.

Perry, Ia.—The Perry Artificial Ice and Storage Co. was sold recently to Hutchinson Purity Ice Cream Co. of Des Moines. The business will be conducted as a Perry concern, according to Mr. Hutchinson. It will continue to manufacture ice and ice cream, and its management will be entirely separated from the Des Moines concern. Ivyl Collins will be in charge of the plant for the present.

Junction City, Kan.—John A. McDonald, for the past five years manager of the Jersey Ice Cream Factory, has disposed of his interest in the company and will take charge of an ice cream business just being organized in Chicago.

Marysville, Kan.—S. B. Hampbill, for the past four years resident manager of the Beatrice Creamery Co. station will go into business for himself. He has leased space in the Marysville Ice Company plant and will install a wholesale manufacturing plant for ice cream. He has secured equipment and expects to be ready to go March 1, under the name of the Marysville Ice Cream Company.

Topeka, Kans.—Farmers' Creamery and Ice Cream Co., in North Topeka, has been authorized by the stockholders of the concern to offer it for sale. C. A. Marker is president.

Fleming, Ky.—New Ice and Ice Cream Company, \$25,000; S. B. Tolliver, W. E. Wright and J. W. Tolliver.

Biddeford, Me.—Ed. Delorge Baking and Ice Cream Company incorporated with capital stock of \$250,000 preferred and 2,500 shares common of no par value. Edouard Delorge, president; B. Alice Delorge, treasurer, and Albert W. Charbonneau all of Biddeford.

Baltimore, Md.—The Superior Ice Cream Co. has bought the entire plant of the Fleischman Co. for \$155,000.

Alpena, Mich.—The Gavagan Ice Cream Company, the Beck Creamery Company and the Hanz-Saff Ice Cream Company of this city have been purchased by the Northern Creamery & Cold Storage Company, Traverse City, Michigan.

Detroit, Mich.—The Arctic Cream Co. has changed its name to the Arctic Dairy Products Co.

Flint, Mich.—The Freeman Dairy Co. of this place, a \$900,000 corporation, has purchased the ice cream plant of

the Davis Ice Cream Co., also all land owned by the company at 229 and 301 S. Cedar St.

Flint, Mich.—The Norwood and Trump Ice Cream Company, capital stock \$50,000. President, John J. McDonald; Geo. E. Norwood, secretary, and W. C. Trump, vice-president.

Saginaw, Mich.—The M. & D. Ice Cream Company has purchased the ice cream division of the Parker Dairy Company of this city.

Kearney, N. J.—R. B. Paterson has opened a new ice cream factory at 543 Kearney Ave., this city.

Newark, N. J.—George T. Cheney of 132 Washington St. has opened up a new ice cream factory.

Passaic, N. J.—North Jersey Ice Cream Company, capitalization \$50,000. Incorporators holding 100 shares of a par value of \$100 each: Benjamin Kramer, Harry Kantor and Lloyd Evans.

Passaic, N. J.—North Jersey Ice Cream Company has been incorporated with a capital of \$50,000. Incorporators, Razenhofer and Razenhofer, Passaic.

Perth Amboy, N. J.—The Castle Ice Cream Company, in order to introduce its product to the notice of a larger public, is conducting a mystery brick contest, giving one quart of milk per week throughout the year to the person guessing beforehand the three flavors in the new brick it is soon to put forth.

Red Bank, N. J.—Oscar Hesse, Jr., son of one of the pioneer manufacturers of Red Bank, has started a business of his own on Broad St., this borough, manufacturing ice cream.

Trenton, N. J.—The Hilderbrecht Ice Cream Co. has offered prizes to local contestants who would write reasons for using Trenton-made ice cream. This is a part of the propaganda of Trenton Products Exhibit conducted during February.

Union Hill, N. J.—A. Libaris has succeeded Thomas Maurovich and Company at 370 Bergenline Ave., manufacturing ice cream.

Westfield, N. J.—Bastian, Edelston and Co. have dissolved partnership. Samuel Edelston has gone into business at a new factory at 229 Broad St., Westfield.

Brooklyn, N. Y.—Smth's Ice Cream Co., East Patchogue, has been sold to the Reid Ice Cream Co. of Brooklyn. Louis W. Smith will remain with the Reid Co., as manager of the

East Patchogue plant, which will be the Suffolk County distributing depot of the business.

Brooklyn, N. Y.—The Sachter Ice Cream Co. has applied for incorporation. Incorporators are: Aug. Grill, Inc., for \$4,500, Leon Kellner, \$317, and Joseph Besen, \$300.

Brooklyn, N. Y.—Sachter Ice Cream Company, manufacturing ice cream, Kent Ave., Brooklyn, has been incorporated by Aug. Grill, Inc., for \$4,500; Leon Kellner, \$317; Joseph Besen, \$300. Judge Garvin has appointed John H. McCooley, Jr., receiver, in bond of \$3,000.

New York, N. Y.—Greenwich Cheese Co., Manhattan, 1,000 shares common stock, no par value; H. Solomon, M. Atlas, Jr.

Newark, N. Y.—The J. T. Castles Ice Cream Co. have bought the plant of the Magna Hotel Corporation of this city. The property includes eight acres with a plant area of 26,500 square feet.

Norwich, N. Y.—With a capital of \$30,000 the Chenango Ice Cream Co. has been organized. The directors are H. B. and G. G. Fuller of Owego and F. J. Oates of Norwich.

Portville, N. Y.—C. L. Vergason was elected president and treasurer of the Portville Ice Cream Co. at the annual meeting in Portville.

Schenectady, N. Y.—The International Ice Cream Co., has purchased an adjoining building, and has thus secured a much needed driveway which will relieve the congested traffic about the plant.

Syracuse, N. Y.—The Syracuse Ice Cream Company purchased the stock, fixtures, supplies, machinery and real estate of the Cloverland Ice Cream Co., on January 26. In all probability the two plants will be run as a single unit, thus curtailing expense.

Charlotte, N. C.—Yarborough & Bellinger, Y. A. Yarborough, president, will erect daylight ice cream factory on Graham St., also three modern electrically driven ice plants of 30-ton capacity each; first unit of ice cream plant will be 200,000 gallon capacity; plans being drawn by Victor Breeze; total ice manufacturing capacity of plants will be 250 tons daily.

High Point, N. C.—Fire destroyed the plant of the Allen Ice Cream Co., with a loss of \$2,000, and no insurance.

Henriette, Okla.—The Golden Ice Cream Co. has been opened on West Main St., and is installing necessary machinery for a modern plant.

Springfield, Ohio—The Purity Ice Cream Co. purchased the Normand tract of land adjoining its plant.

Philadelphia, Pa.—On February 12, Federal Judge Dickenson ordered that stockholders in the Crane Ohio Ice Cream Company who had not received cash payment on their dividend checks dated July 15, 1923, owing to failure of the R. L. Dollings Company, the holding company for the ice cream company, be paid. He ordered \$40,320 of funds so far realized to be segregated for this purpose and directed Thomas Raeburn White, receiver of the Dollings company of Pennsylvania, to have the Crane Company file a bond for \$50,000 to indemnify the Dollings firm in event of any change in the situation.

Philadelphia, Pa.—L. G. Runk of the firm of Hoffman & Runk, ice cream manufacturers here was elected president of the Central Pennsylvania Ice Cream Manufacturers' Association at the annual election held at Altoona recently.

Philadelphia, Pa.—The Crane Ice Cream Co., which some time ago purchased the Markley Creamery, is now located in its new quarters and handling much trade, according to the manager, James F. Cantwell.

Punxsutawney, Pa.—The Jefferson Ice Cream Co., Peter Johnson and Fred Rafetto, have consolidated their businesses into a corporation known as Mahoning Ice Cream Company Inc. Pending the remodeling of the Jefferson Ice Co. plant on Front St., the ice cream will be manufactured in the sanitary and up-to-the-minute plant on North Finley St.

The officers of the new company are: Peter Johnson president; Fred Rafetto, vice-president, and P. L. Brown secretary-treasurer. The stockholders are O. C. Hoffman, J. D. Williams and Linus Lewis. Remodeling the plant will consume about six weeks. New machinery will be installed.

Athens, Tenn.—The Union Ice Cream Company has been bought by T. B. Mayfield from A. R. Deflores. The plant will be run in connection with Mr. Mayfield's farm and dairy business. Mr. Deflores, an Italian, is going to visit his old home in Italy with the proceeds of the sale.

Brownsville, Tex.—C. C. Lambreth, proprietor of the Lambreth Ice Cream Co., has started to build a modern ice cream plant which will have a capacity of 500 gallons a day.

Nacogdoches, Tex.—Nacogdoches Ice Cream Company chartered with capital stock of \$17,500. Incorporators Eugene H. Blount, R. G. Huckleroy, H. Shindler.

Grafton, W. Va.—The Imperial Ice Cream Company has purchased the Acme Ice Cream Co. of this city.

THE priceless ingredient of any product is the honor and integrity of its maker. If you can depend on the reliability of the House from which you buy, you can be assured of satisfaction.

How Much is Your Dealer Worth?

(Continued from page 8)

f his fountain, the more money he will make. Fountain receipts should go to the fountain manager. In getting up ice cream receipts for a fountain operator, remember that he is supposed to know something about the business—merely suggesting the use of fruit flavors in season will usually do more good than trying to concoct some delightful new confection. Whenever you suggest the use of a certain flavor, enclose back bar stickers and window streamers featuring that particular ice cream. Always give the fountain operator something to do or put up.

A portfolio of your entire advertising campaign for the year is always welcomed by the ice cream dealer. In such a portfolio do not attempt to sell the dealer on what you intend to do for him in an advertising way, but make him sell himself by looking over the comprehensive campaigns you are about to run. Such a portfolio should be distributed at the first of each year and should contain everything you will undertake in an advertising way during the year. Outdoor displays, street car cards, display material and dealer help material, newspaper advertising with full year's schedule if you undertake such a campaign, special medium advertising such as periodicals, trade journals and programs, your special order department if you have one, exhibits and fairs you intend to exhibit in. This portfolio should be made up loose-leaf style, so that additions can be made to it from time to time. Your purpose in getting out such a portfolio is to have the dealer read it with interest and keep it for future reference. A telephone list or a few blank order pages at the back of the book will usually solve this problem, as the dealer will probably keep the portfolio for this added convenience.

Recipe booklets prove of invaluable assistance in promoting new business for the ice cream dealer. It is very interesting to note the splendid success the Southern California Ice Cream Manufacturers' Association had with an ice cream recipe booklet which they used. Each ice cream manufacturer was supplied with a certain number of copies of this booklet and arranged with his dealer individually to distribute them in the immediate neighborhood of his place of business. If the dealer so desires it is best to put a rubber stamp imprint with his name and address on these booklets; then get some good distributing company to distribute them. Never take these booklets to the dealer and say, "Mr. Dealer, here are those booklets you asked for, get rid of them," for he is too busy an individual to see to their distribution and they will soon become dust-covered on some convenient shelf behind the counter. These receipt booklets not only sell brick and bulk ice cream but ice cream in combination with fruits in season and with fancy pastries and cakes.

The ice cream dealer always appreciates such a service from his manufacturer and when he notices tangible results coming in from their distribution he is pleased with the co-operation he is getting and becomes a bigger booster for the product.

In some cases dealers may wish to mail these booklets to a selected mailing list or give them to their customers wrapped up with each purchase. In this case it is always best to supply the booklets inclosed in envelopes for mailing.

Another splendid idea for promoting new business for your dealer is by means of a trade letter to a selected list of customers which each dealer will furnish you. This letter must be to the lady of the house and must speak only in very general terms about any dealer. You cannot afford to jeopardize your business with any one of your dealers by making any one of them exclusive agents in any particular territory. Wherever there are several dealers within a close radius of each other, it is best to include names of the several dealers in your letter to the lady of the house. This letter should

Illustration from Southern California Manufacturers' Recipe Booklet.

contain suggestions of the use of fruits and syrups with ice cream to give it a new and delicious delightfulness, which they had never before imagined possible.

If you run a special order business in connection with your ice cream manufacturing, you will have a splendid opportunity to advertise it through this letter. The letter itself may not bring any buyers into a dealer's store, but its cost will be more than paid for by the fact that your dealer knows that you are working with him all the way down the line. The only way to get traceable results on a letter of this character is to send one each month. Lay out a one year's campaign of letters and let nothing deter you from your purpose of sending out the full quota for the entire year. More mail campaigns are failures for lack of consistency than any other one thing. Your salesmen should get a mailing list of the customers from your dealer. In this way he enters into a friendly contact with his dealer and is better able to keep him lined up with your company.

Fountain Demonstrations.

If you ever attempt to make fountain demonstrations you must secure a skilled man for your representative. Above everything else he must have unusual tact and diplomacy to even get a chance to work behind the counter. The thing that the fountain demonstrator should concentrate on is to show the soda dispenser the proper way to dip ice cream and place it in the serving dishes. It is possible to serve from forty to sixty small dippers out of a gallon of ice cream. It is merely the way in which you handle the dipper. A good fountain demonstrator can save the dealer many dollars in waste by a few moments' instruction. The fountain demonstrator should also impress the soda dispenser with the necessity for a clean counter and sparkling

IF YOU KEEP UP WITH OUR ADVERTISERS, YOU KEEP UP WITH PROGRESS.

glassware and dishes. A lady sees plenty of dish washing at home without being subjected to the sight by a careless soda dispenser.

Window and Store Displays.

Window trims and store displays are another means of establishing a splendid contact between the manufacturer and the dealer. The man you send out as a window trimmer must also have tact and personality as first he must gain permission to place your advertising in an already overloaded window. Many times a clever window trimmer will send out advance notices asking for a certain date on which he can trim a window. Ice cream manufacturers should take a lesson

Front Cover of Booklet Issued to Consumers by Southern California Manufacturers in Boosting Greater Per Capita Consumption.

from the Coca Cola Co. when it comes to window trims and store displays. There probably isn't a confectionery or drug store in the United States which doesn't have Coca Cola advertising in it. Many times a dealer does not have a vestige of ice cream advertising, yet you are not in competition with other ice cream manufacturers in that particular store and have a wide open opportunity to make an exclusive showing for your product. Coca Cola, on the other hand, is in competition with many other fountain drinks yet in spite of this fact, Coca Cola is better advertised today than most brands of ice cream. There is no question but that window trimming pays as it has been proven many times that sales have been materially increased after a window

trim was put in. Make it an absolute point with your window trimmer that he always says, "Goodbye" to the store keeper and calls attention to the advertising which he has placed before he leaves.

Window displays should be extremely simple, not difficult, for the better class of dealers today do not sell all of their wares out of the window. Other ideas for dealer co-operation will suggest themselves to the wide awake ice cream manufacturer. Whenever you get a good idea which you think will work out, try it on a few of your selected dealers and if they like it, carry on the good work to every one of your dealers. If your advertising department is large enough you can well afford to have one man do nothing but visit the various ice cream dealers and decorate their windows and back bars. Your window trimmer is many times about the only representative that meets the customer except the driver, so be sure to pick him with exceptional care and see that he is always dressed neatly and speaks courteously upon entering any dealer's store. By following out any or all of these plans you are certain to gain a splendid contact with your dealer which is bound to cause an increase in his business, and as his business increases your profits will increase also.

ICE cream dealers, particularly drug dealers and confectionery dealers, are too busy selling other articles in their store to give ice cream more than a passing thought. In many cases they figure that ice cream rates a smaller percentage than perfumes and other articles and therefore place it in second position. Then, too, in many cases the drug store owner leases out his fountain and does not realize that he is signing away a gold mine to his lessee. The ice cream manufacturer must stir up ideas for the dealers and make it easy for them to carry out the suggestions to completion. You must remember that in a drug store your ice cream is being sold in competition with hundreds and hundreds of other articles all of which must be turned over in order to make a profit for the dealer. The dealer is swamped with quantities of advertising material from everyone of the manufacturers which he represents, and it takes a mighty clever piece of literature nowadays to even receive a glance from the over-rushed dealer.

If you attempt to tell him very much about your product, he will say, "Bunk!" and throw it into the waste basket along with hundreds of other pieces of literature. Tell Mr. Dealer something—but make it snappy—if you **know** your ice cream is better than your competitor's, tell him so—don't hedge. He is glad to know it if it is the truth—he doesn't like excuses and always remind him that your ice cream is constantly asked for because of the splendid advertising co-operation you are giving him. Whenever you get your dealer enthusiastic he will subconsciously try to sell more of your product; human nature is infallible. Your dealer can be made your best salesman because he enters into the final point of contact—the sale. Is he worth educating? Successful manufacturers answered that question years ago. Make the public ask your dealer.

LASTLY we come to Mr. and Mrs. Buying Public who make it possible for your dealer and yourself to do business. Without the public's purchases, the ice cream manufacturer would very soon go to the wall. Anybody can manufacture anything—but anybody can sell everything. If your ice cream is below standard—butterfat, is constantly sandy, gritty or coarse, the public will very soon pass up your store and go to a dealer who handles a better grade product. And as far as it

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Ice cream manufacturers are concerned their best contact with the public is through news publicity in the newspapers and outdoor billboards.

If the ice cream manufacturer puts more butterfat in his ice cream than his competitor and makes richer cream, let him tell the public about it without referring to his competitors. People like to be educated—they have a natural desire to know a little bit more than their neighbor—play on this fact by describing your process of ice cream manufacture—the reason for using various ingredients, etc.

Along with this feature of explaining in common use language about ice cream always end up with a strong appetite appeal, calling attention to the prevailing flavors that are being sold at that particular time. You are fearless and honest in your description of ice cream manufacturing, the public will learn to place confidence in your product and will look upon you as one of the legitimate and reputable concerns of their city. Your copy should always contain the thought of having the public go to the dealer who is a skilled salesman and can tell them all about the merits of your product. Whenever you mention to the public to go to the dealer, you form a friendly contact with your dealer who in reading these advertisements realizes that you are attempting to send the public direct to him. Always mention your dealers in any newspaper advertising you undertake and never forget to mention appetite appeal.

BILLBOARD advertising is primarily directed to the public and should always carry out a strong appetite appeal. The less copy the better on your billboards but make the eye tell the brain that you crave ice cream. There is little opportunity for describing anything about the manufacturing process of your ice cream on billboards. Put sledge hammer blows on appetite appeal through strong pictorial design and you will be successful with your outdoor publicity.

Some dealers attempt to circularize the general public but it has been the writer's experience that this form of publicity is usually more successful when conducted by a group of manufacturers working in a co-operative association than when an individual manufacturer undertakes to do it all himself. If a circularization campaign is undertaken it should be consistent and be laid out on a schedule of some duration. If you circularize the public direct, you should appeal to the food value of ice cream. People have known for many years that ice cream is a delectable and delicious dessert but it has only been within four or five years that they have come to understand that ice cream is even more than this—a perfect food.

Remember that after all your dealer is your best salesman, and is favoring you with his patronage and to the public. It stands to reason that if you had the exclusive sale of your ice cream in every dealer's store in a particular city the public would be able to buy but one brand of ice cream—your own. That is the goal to work for. Get dealers and keep them.

Double dealers' service is becoming less popular each year. Dealers are coming more and more to stock one particular kind of ice cream after having decided it is best suited to their needs. If your dealer is not enthusiastic about selling your ice cream it is almost impossible to work up a healthy ice cream business among the public. Concentrate on your dealer first, last and always—make him a better salesman for your product and a more enthusiastic one. And by general publicity to the public—win them over to a confidence in your product which will make them want to buy your ice cream in preference to any other brand.

Now You Can Make Money Both Ways

Our new sales policy makes it possible for progressive ice cream manufacturers to get Sanisco Ice Cream Sandwich Machines working for them without one cent of investment on their part.

Furthermore, for every Sanisco Machine placed in accordance with our plan we allow a liberal commission that can be retained by the ice cream manufacturer, given entirely or split with the salesman. The inducement offered ice cream salesmen to get Sanisco Machines in their territory means ever increasing sales for the ice cream manufacturer.

Each Sanisco Machine is a self contained ice cream cabinet and self advertising. It finds ready and profitable installation in a great variety of places where no other means of serving ice cream are practical. Also improves sales in places where ice cream is now being sold.

Sold on the easy payment plan at a price they soon pay for themselves.

Get full information **now** and let your sales force increase its earnings and your sales.

Art Students Advertise Ice Cream

Much Interest Created in Ice Cream in Tennessee by Unique Campaign in which Union Ice Cream Co. of Nashville Induced 103 Art Students to Depict Ice Cream as Food Dessert, Selecting Six Best Drawings for Extensive Promotion Campaign

Idea "Sells" Public

MUCH satisfaction is felt by officials of the Union Ice Cream Co., Nashville, Tenn., over the outcome of an unique campaign to promote the popularity of ice cream as a food. Part of this campaign embraced a drawing contest among the various art classes of the city of Nashville. Prizes aggregating \$100 in gold were offered for the best drawings depicting ice cream as a wholesome, appetizing, satisfying food dessert.

Results of the art contest alone lead officials to believe their investment was most profitable in effectively advertising the importance of ice cream in the daily diet, the quality of "Union-made" ice cream in particular, and in the good will gained for their ice cream and the industry as a whole.

Approximately one hundred art students submitted designs. The contest was advertised in daily newspapers of the city, and much interest was created. The contest lasted three weeks. During that time students and teachers of local art schools visited the plant of the Union Ice Cream Co., and were escorted through the various departments by W. E. Drake, secretary-treasurer of the firm, which is one of the largest ice cream manufactories in the South.

BENEFITS of the campaign are summed up by the Wilson Advertising Agency, Nashville, which directed the campaign, as follows:

"Several angles must be considered. When a student enters a contest his whole family becomes interested. In this case they set out to find out why ice cream is a food. They found it and unconsciously "sold" themselves on Union ice cream.

"The students themselves are not likely to forget anything that requires at least several hours of labor and two weeks of anticipation on their part. They are the buyers of tomorrow, and earlier impressions are set deeper.

"When a student wins a prize and that drawing should happen to be put on display in the newspapers, the picture shows, or on sign boards, it is probable that very few friends or kin of that person will fail to have their attention called to it. These drawings, used as advertisements, have far more attention value than the ordinary run which greet the eye every morning. This is true because they are "newsy," they tell what somebody won, where and how; they contain that element which is the greatest factor of any story or any advertisement."

The campaign gave the Union company a solution to a problem that confronts ice cream manufacturers every winter—what to do to stimulate consumption.

Residents of Nashville waked one morning to see, in two Nashville papers, an advertisement announcing that prizes were offered for the best drawings conveying the idea of ice cream as a food. Heads of art departments of the different schools in Nashville received copies of a form letter the following day, this letter asking permission for the Union company's advertising agents to make short talks before the students. This was agreed to by a number of schools, but the public school officials demurred over "fostering any commercial enterprise," a step that was anticipated. But it so happened that the first party to accept the invitation extended in the advertisements for a tour of the Union plant was composed of teachers and students of a public high school. On this tour they received the same information concerning the company's contest that the advertising

representative had spread in among students of other schools.

THE contest closed December 10, so awards could be made in time for Christmas. The highest individual prize was \$25. The reason for such small prizes was to discourage professionals. There were 103 entries, the majority being excellent specimens of amateur art. Some 12 or 14 schools were represented, in addition to participation by several correspondence school students. One institute alone sent in 34 drawings.

Many artistic drawings lost because they failed to carry the message; because the lettering was poor or was too fancy to be legible; had no possibility of reduction to newspaper mechanical requirements; and other mechanical defects.

It is very interesting to note the great variety of ideas offered by the contestants. Though it was not a slogan contest, several worthy slogans were submitted, the best being "In Union there is Strength."

Several days after the close of the contest the entries were put on display at the windows of the Union Ice Cream Company. Prize winners were announced ten days later, December 20. After the awards had been made the drawings were re-arranged and put on display in windows in the very heart of the business district.

The next step on the schedule is to publish the drawings as advertisements in newspapers, on theater slides, and on sign boards—a step the company was preparing to take when this issue was ready to go to press. This will formally open the company's usual spring advertising campaign. (Cuts appear on page 14)

KELLOGG ICE CREAM COMPANY CHANGES HANDS.

F. E. Kellogg has sold his interest in the Kellogg Ice Cream Company, Burlington, Wis., to Edwin Hinchcliffe. Mr. Kellogg organized this company in November, 1919, and today this business has an output of over 100,000 gallons of ice cream a year. Kellogg's ice cream signs are scattered promiscuously throughout southern Wisconsin and northern Illinois, and it is claimed that "Kellogg" is as commonly used for good ice cream in that section as it is for breakfast food.

At the annual election of directors held recently, C. Johnson was elected to take Mr. Kellogg's position as manager, while E. Hinchcliffe was chosen sales manager and secretary.

Mr. Kellogg expects to engage in business in Burlington after a much deserved vacation.

SAILORS LIKE ICE CREAM.

San Juan, Porto Rico—The blue jackets have an appetite for ice cream, and the fleet now assembled at Culebra is having its appetite satisfied at the rate of 600 gallons a day.

Getting the ice cream to the sailors was quite a problem. A purveyor, who supplied the fleet every winter at Guantanamo, had to move his plant to San Juan.

W. H. BENDFELT.

WISCONSIN ASSOCIATION HONORS MILWAUKEEANS.

Two Milwaukee men were honored at the 1924 convention of the Wisconsin Association of Ice Cream Manufacturers. A. H. Graeszel of the Mansfield Ice Cream Co. was elected secretary, and W. H. Bendfelt of the Bendfelt Ice Cream Co. was elected treasurer. Milwaukee manufacturers were praised in convention speeches for putting the "Cream City" among the leading cities of the country in production, second to Philadelphia in quantity and "equal to the best in quality," to quote from the address of welcome by Milwaukee's official representative.

Manufacturer Develops Consumption Through Own Store

Credit Problems, Indifference of Untrained Dealers, and Unprofitable Stops Eliminated by Isaly Dairy Co. by Operating Its Own Stores. Says Mechanical Refrigeration Made it Possible

Strictly Cash Basis

WHAT can be accomplished selling ice cream through retail stores especially fitted for dairy products and operated by men particularly trained to tell the story of ice cream, is illustrated in the experiences of the Isaly Dairy Co., manufacturers of ice cream and other dairy products at Youngstown, Ohio.

In 1920 the Isaly Dairy Co. gave up the manufacture of ice cream as a profitless undertaking, according to the system commonly followed. Dealers were not keeping their ice cream in good condition. Dealers were taking no interest in properly serving the ice cream. Dealers were taking no interest in selling ice cream. The only money made was by the dealers themselves. Collections were poor.

Then came the turning point. In the summer of 1921 the Isaly Company started its own retail ice cream stores. Since that time there has been no bad season. Business is done on a strictly cash basis, stores are on the busiest thoroughfares, located to cater to the automobile trade that passes their doors, also the trade of families in surrounding neighborhood.

These stores concentrate their efforts on ice cream sales, and it has not been found necessary to put on an advertising campaign of any kind, according to A. Isaly.

This bespeaks the good work that can be done toward developing ice cream consumption by men especially qualified to retail ice cream.

THE Isaly Dairy Company has been manufacturing dairy products since 1918. Until the summer of 1920 it confined itself to the milk and butter business.

Ice cream windows are attractively made up for the Isaly dairy products stores from salt of various colors.

"In 1920," says A. Isaly, "we went into the ice cream business, having a wholesale route of about fifty stops. We purchased a number of cabinets and packed the ice cream in ice. At the end of the summer we figured that we had made no profit on ice cream—if anything, had lost money. So about the first of October, 1920, we sold all of our cabinets and in the summer of 1921 started our own retail stores."

"The growth of our stores has been gradual, starting

Manufacturing Plant of Isaly Dairy Co.

ing with one and adding one or two at a time until the present time we have twenty-five in all. We are now handling our entire output of ice cream through them, having no other ice cream retailers.

"We have picked out locations for these stores very carefully. They are all new sites as our stores are stop-

ly dairy products stores and they are the first of their kind in this locality.

"The stores are equipped with a two-ton ice machine. Each machine serves one ice cream cabinet, which holds about twenty-five five-gallon cans, one storage ice cream cabinet holding about fifty five-gallon cans, one wall re-

whipping cream, chocolate drinks, cottage cheese, kinds of cheese, and buttermilk. Stores located in downtown district sell cheese sandwiches.

"It costs about \$7,000 for us to equip the stores to we own ourselves," says Mr. Isaly, "and about \$2,000 for those that we operate on a commission basis."

A Dairy Products Window Display in One of Isaly Dairy Company's Retail Stores.

frigerator and one large storage refrigerator for milk, cream and cheese.

"Men in these stores are taught something about ice cream and its value as a food and its superiority over other food. The stores usually have twelve or fifteen different dairy products on sale at all times. These products include butter, milk, sweet cream, sour cream,

Interior View of One of Isaly Dairy Company's 25 Retail Stores Where Dairy Products Exclusively Are Sold.

He says mechanical refrigeration has made possible their success with the retail stores. He is sure that this venture is far advanced over the experimental stage and believes that with mechanical refrigeration, ice cream manufacturers in most any part of the country can follow this scheme with success. In Mr. Isaly's opinion, the outstanding requirements for successfully operating the retail stores are that products be of the highest type. He adds that the greatest difficulty in handling ice cream and dairy products by confectionery stores and retailers is that these products are not kept properly and that the blame ultimately falls back on the manufacturer.

IOWA MANUFACTURERS TREAT ORPHANS

P. J. Crowley, secretary of the Association of Ice Cream Manufacturers of Iowa, has received from A. W. Stubbs, superintendent of the Iowa Odd Fellows and Orphans' Home, Mason City, Iowa, a letter thanking the Iowa association for its donation of ice cream to the inmates of the home on Christmas Day.

At the farewell steak dinner at the Iowa convention at Mason City in December, money was raised to send ice cream to the orphans' home.

The superintendent's letter of thanks follows:

Mason City, Iowa, Dec. 29, 1913

Dear sir:

"Through the E. B. Higley Co. of this city, we have received the donation of ice cream which was donated by your association when they met in Mason City recently.

"It was a mighty nice thing for you to do, and I wish I had the descriptive power to tell you just how much it was enjoyed by every one of our large family, there was indeed a real Santa Claus for every child and plenty of brick bats for the older ones.

"Such acts of kindness spread sunshine along the pathway of the children, and make the road toward the setting sun of life just a 'bit' brighter for the old people. Thank you kindly.

With the best of good wishes for the success of your association, I am

Very truly yours,

A. W. STUBBS,
Superintendent

Economy Cabinets

Dry Package Cabinets

Most efficient dispenser of Brick carton, dry bulk package, or Eskimo Pies. Each package goes to the customer in perfect condition having had superior refrigeration in a container totally surrounded by ice, in a cabinet heavily insulated with cork.

New Corkboard Cabinet

The manufacturers have come to realize that superior insulation means money saved on ice consumption. This tapered cabinet has an average of 3" corkboard on the side and 4" on the bottom, lined on both sides by water-proofing paper. Equipped with 7/8" buffer board to protect bottom of cabinet, making a cabinet that is far superior to ordinary styles.

Tub Cabinets

This separate compartment cabinet is especially designed for rural trade, as one compartment alone can be used without being compelled to ice the entire cabinet. The tubs of the cabinets are especially treated to prevent leakage.

ALL Cabinets finished in highly polished mahogany.

NOTES OF THE TRADE

News of Interest Concerning What Our Readers and Advertisers are Doing to Develop the Industry. We Invite Correspondence Relative to New Products and New Equipment.

NEW MOTOR-DRIVEN BABCOCK TESTER.

There has been placed on the market a motor-driven Babcock tester which, officials say, embodies several improvements in construction. The bowl, or bottle carrier, is made in two sections, the upper half being easily removable for inspection and cleaning.

Crepacco Type "K" Motor Driven Tester.

The machine can be driven either by hand or electric motor as desired, the driving mechanism being underneath the body of the tester. All gearing is of the spiral type, mounted in a grease tight gear box, producing a noiseless drive. The hand crank does not engage the gears when not in use and it is not necessary to remove it when operating by electric power. The weight of the tester proper or bottle carrier is supported upon a collar thrust ball bearing, giving the machine long life and ease of running. The bottle carrier is of high tensile strength steel, acetylene welded, insuring great strength, we are told. All parts of the machine, it is claimed, are interchangeable. The machine is made in three types: Combination electric and hand power, electric power only, and hand power only.

A folder describing this new outfit may be obtained by addressing the manufacturers, The Creamery Package Mfg. Company, 61 W. Kinzie St., Chicago, and mentioning this publication.

REFRIGERATOR BODIES FOR ICE CREAM MANUFACTURERS.

The Joseph Miller Company of Minneapolis, Minn., is building a line of Miller refrigerator bodies for ice cream manufacturers which is said by company officers to be attracting widespread attention. These bodies are built in seven sizes to meet requirements and run in body weights from 1,100 pounds up to 3,500 pounds and with an ice cream gallonage capacity of from 100 up to 500 gallons. This firm has been making rapid strides in progress and popularity among the trade, including many satisfied users of Miller bodies and some fine testimonials have been given by ice cream manufacturer. Bridgeman-Russell Co., a well-known Duluth, Minn., ice cream company, says, "We are using a Miller body delivering ice cream and find that it works very satisfactory, and so far has done splendid work." The Northland Milk and Ice Cream Company of Minneapolis, Minn., says, "We have found Miller bodies entirely satisfactory. We expect to change over three or more routes and the new equipment will be Miller bodies." The J. C. Vander Bie Co. of St. Paul, Minn., says, "After the initial charge of ice and salt of approximately five hundred pounds, it took no more than three ordinary pails of ice and salt to repack each wagon daily, and the temperature in the ice cream compartment was maintained at from six to eight degrees above zero." The Miller company will furnish its illustrated literature to

HENRY C. MOTT.

Henry C. Mott, raw sugar buyer of The American Sugar Refining Company for more than a quarter of a century, died suddenly on Tuesday evening, January 24, at his home No. 428 Grand Avenue, Brooklyn. An attack of the grip on the Sunday before Mr. Mott's death developed into pneumonia and proved fatal just when there seemed to be every hope of his recovery.

Mr. Mott was 65 years old and had been in the sugar business for exactly half a century. He was an Englishman by birth, but became a naturalized American citizen. Entering the employ of The Decastro & Donner Sugar Refining Company as a clerk in 1874, he became an assistant of Mr. Havemeyer after the consolidation of the company with the Havemeyers & Elder Sugar Refining Company in 1887. In 1901 Mr. Mott was elected a director of The American Sugar Refining Company, a position which he occupied for nine years.

HUTCHINSON ICE CREAM COMPANY INSTALLS CHERRY EQUIPMENT IN NEW PLANT.

When the new branch plant of the Hutchinson Ice Cream Company, with headquarters at Cedar Rapids, Iowa, opened at Mason City, Iowa, this spring, it will be recognized by visitors as a Cherry installation.

The equipment will include two Cherry 50-quart freezer, two 500-gallon Cherry steel body aging tanks, one 500-gallon steel body Cherry batch mixer and pasteurizer, a Cherry three inch tubular cooler and a complete set of Cherry sanitary fittings.

Frank Ballantyne, formerly the proprietor of the Fore City, Iowa, Ice Cream Company, has been engaged by the Hutchinson Ice Cream Company as territorial manager for their North Iowa plant, and will have his headquarters at Mason City. Mr. Ballantyne sold his interest in his Fore City plant to the Hutchinson Ice Cream Company, and has since made the connection with them referred to above.

The Hutchinson Ice Cream Company now is using two Cherry freezers in their main plant and branches.

* * *

Elsewhere in this issue you can read the advertisement run by the Century Electric Company of St. Louis, Mo., who is offering a Century one-fourth H. P. motor which is particularly desirable for installation in the operation of refrigerating machines used for cooling ice cream cabinets. The motor is quiet in operation and is particularly suited to installations equipped with automatic start and stop control. The company handles a fine line of motors from one-eighth H. P. to forty H. P. and they are particularly adapted for use in the dairy industry. Their automatic start induction polyphase motor is by virtue of its characteristics of simplicity of operation particularly suitable for the operation of pumps, air compressors, refrigerating machinery for those installations where remote or automatic control is necessary or desirable. The type "SC" squirrel cage induction motor is usually selected where the starting duty is low, as in the case of agitators, blowers, ice crushers, in those installations where manual operation is feasible. The company will furnish attractive and instructive booklets to anyone interested in Century motors.

* * *

Announcement has been made that L. W. Peiffer, formerly with Paul Heath Co., now is handling the lines of the Star Extract Works and the Kay-White Co., 8 West Broadway, New York. Mr. Peiffer expects to make his headquarters in Los Angeles and concentrate his work in the coast states. In that territory he will handle the "Scotch Bo" lines of extracts, flavors, custards, and ice cream powders for the companies.

* * *

The G. W. Wardrop Co., manufacturers of Elpam, 40 Broadway, South Boston Station, Boston, announces the

Garry A. Benners of the Southern Sales Service, New Orleans, has been made southern sales agent for the Wardrop Company's Elpam flavor. Mr. Benners is president of the Dixie Icyers. He is the originator of the slogan "Eat ice cream every day—it's a health food." This slogan was adopted by the Mississippi association at its 1923 convention, and other associations have followed since.

The Hohmann-Nelson Co., manufacturing engineers, Eau Claire, Wis., has announced the sale to the American Schaeffer & Budenberg Corp., Brooklyn, N. Y., its important assets, including accounts receivable, orders in hand, trade marks, trade names, patents, good will, etc. Officials say that all tangible assets have been delivered to the Brooklyn Company. They feel that combining their line of Honeco Thermometers and temperature controllers with the line of similar and closely allied instruments and appliances of the American Schaeffer & Budenberg Co., will enable them to care for the needs of dairy plants of the country in a much larger way than has heretofore been possible.

The personnel of the Honeco organization including the resident, A. H. Nelson, and essential department heads, has been retained and will be greatly augmented by the engineering and manufacturing services of the Brooklyn company.

Since 1875, L. F. Grammes & Sons, Inc., 334 Union St., Allentown, Pa., has been serving the business men throughout the country with products of established quality at the right prices. In these 49 years of service, they have gained deserved recognition as the manufacturers of one of the largest, and most varied lines in the country. Their line of 5,000 products is classified in the following divisions: Ice cream and soda supplies, office supplies, signs and name plates, cabinet hardware, metal checks and badges, advertising novelties, metal stampings, metal turnings cigar mfrs. supplies, factory supplies, wire formings, shipping supplies, metal findings, nails and rivets, card holders, paper box mfrs., supplies, safety devices, nailing machinery, paper box machinery and printing machinery.

Grammes' have recently prepared an illustrated catalog showing a very complete line of equipment. Supplies and accessories for the ice cream, soda fountain, candy shop, luncheon, cafeteria, etc., which they will gladly forward to any one asking for a copy. See their advertisement on a page of this issue.

The Ramey Brokerage & Storage Co., Inc., of Brownwood, Texas, is operating one of the largest pecan shelling plants in the state of Texas outside the city of San Antonio. They are prepared to give ice cream manufacturers prompt service and quality goods on shelled pecans for brick and fancy ice creams. These pecans are reported as shelled from a new crop of Texas pecans. The company would like to get in touch with active brokers or specialty salesmen in territories where they have no representation. Brooke S. Ramey and Walter B. Wilson are the managers.

Branch offices have been established at Los Angeles and San Francisco at 610 Grosse Building and Rialto Building respectively by the Eskimo Pie Corporation of America, with headquarters in Chicago, officials announce. N. E. Horton is the Pacific coast manager, and he says the company is now prepared to supply the needs of the ice cream trade on the coast with wrappers from their offices in San Francisco and Los Angeles. He says the sale of Eskimo pie is increasing throughout the Pacific coast cities.

Announcement has been made by the Lipman Refrigeration Company, Beloit, Wisconsin, that officials have made connections with the following concerns to distribute their equipment: Safety Electric Service Co., Baltimore, Md.; Southwestern Refrigerating Co., Wichita, Kan.; L. P. Moore Co., 407 Shipley St., Wilmington, Del.

The Dairy Laboratories, 23rd and Locust Streets, Philadelphia, Pa., has announced the appointment of George Jaggard as assistant manager of the Philadelphia laboratory, working directly under the supervision of Dr. H. C. Campbell, director and manager. Mr. Jaggard assumed his duties on January 1. The new assistant manager is from a family that has for many years been identified with dairying, he himself having been employed in the dairy business for more than ten years. He familiarized himself with the phases of the practical operating end of the business in four years' experience in a large commercial dairy. Mr. Jaggard is a graduate of the University of Pennsylvania with a degree of bachelor of science in chemistry.

His new work will embrace field service in connection with the interpretation of results in their application to plant operation improvement, officials announce.

"HY-SPEED" MIXERS.

The photograph shown below is fairly descriptive of what is believed by its manufacturers to be a very ingenious and entirely new method of mixing liquids by a portable machine which can be clamped to any convenient tub or tank from twenty gallons up to one thousand in capacity.

This new method of utilizing "push-pull" propellers represents the latest scientific and most efficient means for the complete and rapid intermixing of liquids, it is claimed.

On the motor driven shaft are attached two propellers so positioned and pitched that the lower blade throws the liquid upward to meet the stream of liquid which the upper throws downward. This causes a complete intermixing of the liquid mass without the danger of splashing or spilling, as the streams are brought together beneath the surface of the liquid.

It is to be noted that all moving parts with the exception of the shaft are outside of the liquid and that an extremely small surface of the metal is exposed to the action of the liquid being mixed.

Any concern who is now mixing any kind of liquid, thick or thin by hand methods or the old fashioned type mixers, will find that the new Hy-speed mixer with "push-pull" propellers will pay for itself in a very short time and insure a much better article.

It is stated by the manufacturer of this device that one concern formerly required a man's time for three days to make up a heavy thick liquid, at a cost of \$15.00 for labor, which is now being mixed by a hy-speed mixer in three hours at a cost of \$.15 for electricity. This is just one example of the great value of a scientifically designed machine over the conventional hand methods which have been in vogue for so many years.

If any reader is interested in the above described device, which is sold in sizes varying from \$37.50 to \$110 each, the manufacturers' address will be given.

On another page in this issue of The Ice Cream Review you will find an advertisement announcing pure tin coating which can be painted on with a brush—a coating for all kinds of repair work—which will interest the ice cream manufacturer as it will save the necessity of sending his equipment away for such repairs, according to claims. The product can be obtained in powder and liquid forms and a pound is offered for trial, mailed prepaid, for one dollar. There will be many an odd job around an ice cream plant where such a coating will come in handy, according to the American Solder & Flux Company at 2910 N. 16th St., Philadelphia, Pa., where this material can be obtained. The company also handles Tinol, which is a solder in paste form and is ideal for radio work; in fact the company has a coating for all sorts of work from apparatus used in hospitals and hotels down to storage batteries where protection from acid fumes is important.

Robert P. Kehoe of 7 East 42nd St., New York City, is offering for sale equipment which will be of interest to the ice cream industry. A liquidation sale on a list of modern ice cream plant machinery which has been operated, it is said, for only a few months will enable the ice cream manufacturer to pick up some good equipment at the right prices. The list includes glass-lined mixing and storage tanks, and glass-lined pasteurizers, glass-lined milk tanks, vacuum pan, homogenizer, can washer, ammonia compressor, ammonia

ALL DIXIE IS LOOKING FORWARD TO 1924 NATIONAL CONVENTION AT NEW ORLEANS.

condensers, brine cooler and pump, ice crushers, piping, etc. This company also carries a good used refrigerating and ice-making machinery stock. The company will give prompt attention and good service to any inquiries.

The Purity Paper Vessels Company of Baltimore, Md., manufacturing the well-known line of purity paper cans and pavesco paper milk bottles will exhibit its products along with appliances to more efficiently handle its containers at the coming Paper Industries Exposition, which will be held at Grand Central Palace during the week of April 7th to 12th, inclusive. The company will occupy booth space Number 65 at the exposition, and cordially extends an invitation to all those interested in paper cans and paper milk bottles to visit the booth for a discussion of containers and their particular application to the business in which the individual is interested.

W. R. Lenderking, vice-president and general manager of the Purity Paper Vessels Company, will be in New York during the entire time of the show, and the exhibit will be in active charge of Allyn G. Whitehead, supervisor of sales of the eastern district. The company also extends an invitation to those interested to use the facilities of its New York office at 342 Madison Avenue while visiting New York.

Announcement has been made by the Daigger Corporation, 54 W. Kinzie St., Chicago, through its manager, George L. Newman, of the addition to its sales force of Ben Ogden, Jr., treasurer of the Iowa Poodle Dogs. Mr. Ogden will cover the central states for the Daigger Corporation, it is announced. He has been identified with the ice cream industry for the past fifteen years.

The Circlet "T" is the name of the house organ issued by Tait Bros., Inc., manufacturers of ice cream and other dairy products, Springfield, Mass., which made its appearance in February. C. A. Reynolds is editor-in-chief. It is replete with a number of interesting items relating to dairy products.

J. H. Constantine of the Rice & Adams Corporation, Buffalo, has been transferred from the company's Chicago

office to their service department in the home office at Buffalo.

John A. Owen, Jr., associated for some time with the Thompson Malted Food Company of Waukesha, Wis., joined forces with the Purity Paper Vessels Company of Baltimore on February 11th. Mr. Owen will work the middle Atlantic states for the Purity Paper Vessels Company in direct association with Allyn G. Whitehead, sales supervisor in the territory, it is announced.

C. R. Hauk, secretary of the Oklahoma Wolf-hounds, announces that his firm has moved into its new home, and Mr. Hauk's new address is P. O. Box 988, Britton, Okla. He invites members of the Oklahoma Wolf-Hounds, the Oklahoma Association of Ice Cream Manufacturers and other friends to visit him.

Robert B. Hand has accepted a position on the technical staff of the Elyria Enameled Products Co. Mr. Hand is a graduate in chemistry of Wooster College. His training and previous experience are such as to fit him for valuable service in the application of enameled apparatus in the various industries to which his time will be devoted, Elyria officials say.

Max Donauer, who for several years was chemical engineer with the Elyria Enameled Products Co., recently resigned to accept the position of superintendent with the Robb-Ross Co., Sioux City, Iowa, manufacturers of a wide variety of food products.

Roberts Everett, for five years since its re-organization secretary-manager of the Association of Ice Cream Supply Men, announced early in February the opening of a personal office at 1328 Broadway, New York.

Mr. Everett is prepared to act in a consulting or general directing capacity for associated private interests in other fields, trade organizations or educational or other institutions in organizing, publicity and promotional matters.

Mr. Everett's responsibilities as secretary and manager of The Association of Ice Cream Supply Men remain unchanged. He will have with him, as may be required in personal activities, assistants of general corresponding or supplemental training and experience to his own, it is announced.

Announcement has been made that C. W. Smith, for many years with the Hudson Manufacturing Co., Chicago, has accepted the selling agency for the Grand Rapids Cabinet Co. of Grand Rapids, Mich. This in no way affects Mr. Smith's relations with the Hudson Manufacturing Co., he says. He covers the Southwest, operating from Dallas. Mr. Smith says the weather in his territory is very favorable for an early spring opening for the ice cream manufacturers. Manufacturers in Southern Texas, he adds, are optimistic over the outlook for 1924. Mr. Smith's son, Russell Smith, also represents the Hudson Manufacturing Co., in the Southwest.

The Tallassee Power Co., 2400 Oliver Building, Pittsburgh, Pa., is offering a list of equipment for sale which will be of interest to ice cream manufacturers. These goods are all new and have never been uncrated. Among the equipment are listed two Frick double cylinder ammonia brine refrigerating plants complete, two Perfection tubular cooler with a capacity of 4,000 pounds per hour, two Emery Thompson brine freezer tanks of 40 qt. capacity, with coils for hardening rooms, two Creasy ice crushers, belt driven, and also Cherry pasteurizers, vats, pumps, motors and numerous other equipment.

Supply Association Completes Five Years of Activity

Re-election of Officers Follows Annual Meeting—Fair Practices Growth
Cited as Outstanding Year's Development

THE fifth annual meeting of The Association of Ice Cream Supply Men, since its reorganization in 1919, was held in New York City, January 14. Directors elected met after the meeting and re-elected O. S. Jordan, president; H. H. Miller, vice-president and Thomas D. Cutler, treasurer.

Comprehensive reports by officers and committees were approved with applause. The general atmosphere of the meeting and tenor of reports of work accomplished were those of President Jordan's statement that: "This organization has written a remarkable five years' history. I know that its record has been possible only through the steadfast co-operation of the whole membership, and I therefore make the keynote of my report one of congratulation to the wide membership for the splendid work it has made possible."

The president reported that "in members, in financial strength, and in industrial importance, the association is stronger today than a year ago. Each year for five years I have had the gratification of reporting that 'all is well.' Each year the 'all' has been more inclusive. So far as intelligent foresight can go, there is no dark cloud visible on the horizon of our businesses, of the organization, or of the industry to which we supply our products."

Summarizing briefly the development and operating field of the association, Roberts Everett, secretary-manager, told the meeting: "A little less than five years ago an organization meeting was held. Two or three months after that offices were opened; dues were collected from twenty-six members. By the next annual meeting there were 89; by the second, 86; by the third, 96; by the fourth, a year ago, 114; today there are 123 members."

"Five years ago it was realized that certain conditions faced by supply men were not right. It was also more or less definitely believed that big opportunities were ahead."

"Today the association is certainly third or fourth and some of its friends will say first or second among supply and equipment associations in the country, basing this rank on membership, finances, number of activities, their success and the or-

ganization's importance in the daily life of its industry. As merely one of its activities and without strain or fuss it recently conducted an exposition, the fifth or sixth in the country in rank among shows for manufacturers. In a quiet way more than one company in these five years has built up its business, or an ice cream department of its business, from comparative insignificance to volume by taking every-day advantage of the association's work. This is actual testimony from these members; and every member who has followed up the organization's work consistently and understandingly has shared an increase, or decreased the effects of depression when these have come. Moreover, through its informed spokesman the ice cream industry itself admits a tremendous stimulus to its energies from this association, and it has plainly benefited by the ethics and the enterprises supported here.

"Today the particular conditions rebelled against five years ago do not exist; and the opportunities then foreseen are largely realities. The association that you founded and support is enabling you to do business with less waste sales effort, to a greater market, in a friendlier atmosphere.

"On the one hand the law, on the other our members' making of many products instead of one and their common concern in a given market instead of in a given item, set a plain limit to what an equipment organization can do. Practical considerations affect the common market in which this interest lies—the ice cream industry—which automatically rule out some activities that the law and the nature of an equipment organization would otherwise permit. But within the limits of the law, the peculiar character of a supply or equipment association and common sense, the association has already been doing, for at least two years all of the kinds of things that it should do today.

"In general terms the most important progression in 1923 has been the extension of insistence on common sense fair practices. Instead of a cold document in type called a fair practices code there has come to be in the last year more and more truly a living document called the fair practices code, its vitality derived from living men and companies and committees that have in themselves and others established a living sentiment to support it, live up to it and apply it practically to actual trade affairs. Gradually in the last year it has become evident that the association as an institution has begun to have a working, as well as a documentary conscience, an ethical substance that has a sensible relation to such things as daily sales, daily advertising and the general conduct of that great, common and important thing, the day's business.

SUPPLY ASSOCIATION COMPLETES FIVE YEARS OF ACTIVITY.

(Continued from page 155)

"The development of such an insistence on fair practices by an institution is a protection of its good name. Probably no one or no force anywhere can successfully injure that good name so long as its own members, by unfair practices or their condoning, do not themselves imperil it."

Further stressing the fair practices attitude of the association, the secretary-manager commented on the appointment early in 1923 of a vigilance committee to co-operate with a similar committee of the National Association of Ice Cream Manufacturers. "Its field of vigilance has been advertising," according to Mr. Everett, "and in that field its work has been, to a large degree, merely a further form of fair practices enforcement. Its guiding document is, instead of the fair practices code, the declaration on advertising of the National Association of Ice Cream Manufacturers. The latter is not a mere catalogue of bad practices, but is also a statement and discussion of principles. The work of the vigilance committee has largely been the applying of these principles to specific cases of greatly varying character that have involved real or alleged mis-statements or injudicious or injurious statements in advertising to the ice cream industry. Its method of procedure and that of the board of directors in the latter's hearing of charges of violation of the code are different, yet the activities of each are parts of a general total, the maintaining of fair practices."

A number of matters of current interest to the industry and to the companies selling to it were discussed. By unanimous vote the determination of exposition policies for 1924 was left in the hands of the board of directors.

The following committee reports were submitted: Membership, by B. B. Scott, chairman; exposition, by K. W. Schantz, chairman; fair practices, by O. S. Jordan, chairman, vigilance, by W. L. Cherry, chairman.

Present and projected activities of the Salesmen's Club were outlined by President Thomas.

By unanimous vote the president was authorized to appoint a nominating committee which consisted of Henry Rosenstein of Thos. W. Dunn Co., John R. Wells, Cone Co. of America and N. M. Thomas, Cherry-Bassett-Winner Co. The committee suggested twenty-three nominees for election to the board of directors: O. S. Jordan, Brown & Shaw; Thomas D. Cutler, Ice Cream Trade Journal; H. H. Miller, H. H. Miller Industries Co.; John H. Mulholland, John Mulholland Co.; H. A. Keiner, Keiner-Williams Stamping Co.; B. B. Scott, K. W. Schantz, K. W. Schantz, Inc.; J. W. Hussey, Davis Cooperage Co.; Eric Scudder, Citrus Products Co.; L. B. Esmond, Essex Gelatine Co.; J. L. Nelson, C. Nelson Mfg. Co.; C. B. Robinson, J. B. Ford Co.; C. Mortenson, Standard Milk Machinery Co.; W. L. Cherry, J. G. Cherry Co.; S. E. Perkins, J. O. Whitten Co.; Albert McDougall, Allman Gas Engine & Machine Co.; David Michael, David Michael & Co.; Frederick C. Mathews, Frederick C. Mathews Co.; J. H. Stoddard, Dominion Chemical Co.; Wyn B. Morris, Barker, Duff & Morris, Edward Heller, B. Heller & Co., and H. S. Calvert, Elyria Enameled Products Co. and Robert Soule, Merrell-Soule Sales Corporation.

The result was the election to the board for a term of three years of O. S. Jordan, Thomas D. Cutler, H. H. Miller, John H. Mulholland and H. A. Keiner; for a term of two years of B. B. Scott, K. W. Schantz, J. W. Hussey, L. B. Esmond and J. L. Nelson; and for a term of one year of W. L. Cherry, Robert Soule, S. E. Perkins, Albert McDougall and Wyn B. Morris.

Following adjournment luncheon was served at the McAlpin Hotel.

Following the re-election of officers by the directors later in the day President Jordan announced the re-appointment of the following committees: Executive, O. S. Jordan, chairman, Thomas D. Cutler, H. H. Miller, John H. Mulholland and H. A. Keiner; exposition, K. W. Schantz, chairman, Albert McDougall, L. B. Esmond, Thomas J. Stewart and Roberts Everett; and the appointment of the following com-

mittees: membership, B. B. Scott, chairman, K. W. Schantz, J. L. Nelson, S. E. Perkins and Robert Soule; vigilance, W. L. Cherry, chairman, H. A. Keiner, Thomas D. Cutler, L. B. Esmond and Robert Soule.

Trade Literature

Readers interested in buying new milk or ice cream plant equipment will be interested in the 1924 Elyria milk equipment catalog.

This booklet is the most complete treatise ever published on glass enameled equipment, the Elyria company believes. It contains complete information on the operation and economy of Elyria storage tanks, pasteurizers, starter cans and auto truck transportation tanks. Accompanying this information are tables and specifications of the eight standard types of storage and aging tanks, the three types of pasteurizers, etc.

The last section of the booklet is devoted to a detailed discussion of the construction of these units. The various covers, valves and other fittings are illustrated and described. This book is illustrated throughout with installation photographs.

A copy of the booklet will be sent upon request of the main office of the Elyria Enameled Products Company, Elyria, Ohio.

U. S. FREEZER CATALOG.

The U. S. Freezer & Machine Corp. has just published a circular for the benefit of small ice cream manufacturers who might be interested in either horizontal or vertical ice cream freezers of small capacity, that is, 40 quarts.

The 1924 U. S. Freezer catalog is now ready to be mailed to all those interested in larger scale production of ice cream. This catalog contains many illustrations of modern wholesale ice cream manufacturing plants (including some 20 new ones from 1923) everywhere in the United States using freezers of all sizes and in numerous combinations from one to ten.

It also contains pictures illustrating all the types and features peculiar to U. S. heavy duty freezers, including cross sections to show their internal construction and operation. All of the new devices and latest improvements are described in detail.

APRIL 1924

IN FEATURING in this issue the development of the ice cream industry of New England, The Ice Cream Review is placing before its readers an account of progress that has been carried out along very thorough lines for stability. The story of the New England industry is a story of men who long ago realized that individually they could do little, while collectively they could eliminate from their industry everything standing in the way of advancement.

The front cover design this month depicts the growth of one of the country's great dairy products institutions over a period of thirty-five years. It might also be said that this design illustrates the strides of the New England ice cream industry as a whole from the days of the hand freezers to the present time of modern efficiency.

The gentlemen of the New England ice cream industry have a very interesting story in this issue for every man who wants to see quality, co-operation and business efficiency established as the cornerstone of the industry's plan of development.

WITH the birds of May poised for their flight, the question of the hour is, will this be a good ice cream year? It is very reassuring to note how many answer in the affirmative. A canvass of the industry, it is felt sure, would reveal that much is expected for this good year of 1924.

Many men who do not think they ever have discussed the matter with The Ice Cream Review already have told us that they are looking for a "big year." Very often The Ice Cream Review has occasion to "sound out" ice cream men to get an idea of just how the industry stands on certain points, but in looking forward to the opening of the spring drive, it was not necessary to do more than to read between the lines of letters written by men who did not know they were discussing the trade outlook at all.

The gentleman in Missouri, for instance, who wrote us that his new ice cream plant is in operation and running smoothly, did not realize that in his happy optimism over that new home he had built there ran a thread of enthusiasm which showed this gentleman to be looking for high tidal waves of good business. Since there were similar letters from many other states, it was easy to read of big expectations throughout the industry. A warm-hearted old friend from the Southland wrote that in spite of the most severe weather his section ever had received, his rheumatism was much better. A man's rheumatism ever gets better unless there is something to cause his good humor to rise, like a bright cloud of prosperity for instance.

We are in the habit of believing the weather has much to do with eating ice cream. No doubt, it does, but with the worst spring weather on record for many years, there was more ice cream eaten last spring than during any previous spring in history. None of us can say just what the weather holds in store this year, but it is felt sure that there is a spirit abroad in the ice cream industry which will not be denied.

There are many reasons to believe that 1924 will be the ice cream industry's year.

THE ice cream industry is rapidly working away from that unwise practice of loose credits. Elsewhere in this issue appears an article in which we discuss credit abuses at some length. For many years manufacturers have struggled under this burden, and it is generally agreed that this evil must go. When it reflects upon the many members of the industry who find themselves producing more ice cream with greater effort and increased investment and yet making less money, it is to be reminded that the time has come to chink up all the wasteholes through which profits are escaping. Regardless of how much advancement may be made in every other direction, this industry cannot survive and prosper without a careful check upon its channels of income and outgo.

THE Minnesota State Association of Ice Cream Manufacturers does not recognize any such thing as a season. Always it is the open season for these gentlemen to set themselves to work promiscuous of good things for their business. During the winter the Minnesota association, not content with an annual meeting, held district meetings to discuss means of keeping ice cream moving during cold weather. Long before the first rollicking call of the robins the Minnesota gentlemen were underway with plans for "National Cone Week."

The idea has been seized upon in many parts of the country, with cone manufacturers, of course, giving their cooperation. The plans of the Minnesota gentlemen, as outlined by W. W. Dunn, Jr., president of the Minnesota State Association of Ice Cream Manufacturers, call for having "National Cone Week" observed throughout the country, beginning on Decoration Day, May 30, and continuing through the next week.

This idea recommends itself to many manufacturers with whom The Ice Cream Review has been in communication as singularly promiscuous in many ways. In the first place, it seems generally agreed, it would make an auspicious starting point for the 1924 ice cream "season." Many people have regarded the cone merely as a container, and there is much good to be done by impressing upon the public that the cone also is a delightful food companion to the ice cream—an added appeal to the palate. Streamers have been prepared for ushering in "National Cone Week" with a "bang" on May 30.

There have been many suggestions for a "National Ice Cream Week," and they should be given serious attention. There is no reason why a "National Ice Cream Week" should not be held sometime this year, and in all succeeding years. Many other industries—and virtually all other food industries—have their special weeks. Why not the ice cream industry? This movement seems to be a step in that direction.

People mindful of what it means to launch a nationwide movement to attract the public's attention to a given product will watch with much interest the outcome of plans for "Cone Week," an idea originating among the wide-awake gentlemen of Minnesota. Score another victory for the Gophers.

WE HOPE that you fellows out on the "firing line" fully realize that The Ice Cream Review is edited, printed and published by folks very much like you, assuming that you are very ordinary folks. The bigger you are, the broader your vision and the more responsibility you are carrying, the more "ordinary" you are when measured by our measuring stick.

We like ordinary folks. We can meet and do business with the fellow who is all swelled up on his job like a poisoned toad, but we don't like to. We get away from him as soon as we can and we stay away from him as long as we can.

We enjoy knowing the problems of ordinary folks. We like to work with them and help them solve these problems. Occasionally we are able to really help them

over the rough spots and then we feel like we do on Sunday after making a special effort to get to church.

You folks who have visited us here know that we are a busy, happy bunch. We are busy creating ideas in a building where once beer was the sole product manufactured. We like it—we mean the work—and we wish that every reader of The Ice Cream Review could drop in on us and get acquainted.

Many are going to have the opportunity. Many will visit the National Dairy Show next fall and we want to, thus early, cordially invite you to come and see us. We are located on the same street as the big Auditorium, six blocks due north. Please put us on your calling list. We plan to put on our best bib-and-tucker for the occasion and we will be looking for company. We shall even wash the print shop towel. We shall want to see you just that badly. Now, please come.

WE GET a lot of fun out of this job. We have our trials, but the most of them melt away like the morning dew. The fellow who first said that "life is just one — thing after another" must have gained his inspiration in some job like this one.

We would miss the thrills of this job. We can sympathize with the fellow who laps up home brew solely for the "kick" that is in it. He misses the good old days. We go through the basketfuls of stuff that go across our desk looking for kicks. We get them—not the complaint kind necessarily, but the kind that give us a thrill and you feel that we must share with the rest of the folks in the office. We all have our fun out of it, and we notice the typewriters then travel at higher speed in order to make up for lost time.

A good friend in Ohio wrote us the other day, sending along a check. He had heard several times from the subscription department with those "please remit" appeals. He said, "Say, I have just begun to realize what you want of me. I've been reading over a lot of 'stuff' from you people and as near as I can get to the point you must want money. If you can't read this send it back and I'll send you another."

Now, in the first place we can read any letter in which a check is enclosed. Then when the writer puts a "kick" in his letter we will find it no matter to what length we must go in order to decipher his hieroglyphics. Like the Irishman who was determined to get the cork out of his whisky bottle even if he had to push it in, we are very determined about some things. For instance, it is right now just about quitting time and when we go home for dinner we are going to have some ice cream. If Friend Wife has not arranged for it we shall go right over to the drug store and get it. And it will be good ice cream, too.

MANGUS JOHNSIN lost a milking contest in Washington. Somebody ought to tell him that they know something about milking in the Capitol City,—and a lot of it that is not according to Hoyle.

THERE is considerable discussion in this issue regarding district meetings in the ice cream industry. The spread of this idea is one of the most noteworthy developments that have come about in a decade. Annual state conventions serve a very good purpose, but it is at the chatty, informal get-together meeting that the manufacturers best get in effective work that serves toward better understanding.

After all, in the ice cream industry, as in other lines of business, there is much hinging upon a common understanding. By understanding, we do not mean that ice cream manufacturers should draw themselves to one side and so operate as to injure another branch of industry, for manufacturers themselves are sensible enough to know that nothing benefits anyone unless it benefits everybody.

Years ago many manufacturers felt that they were alone in a great wilderness of wild doubts and fears, with no definite understanding of where they stood or what they could expect of their neighbors. Many times in the past a manufacturer has felt himself to be in the position of a man recoiling from a blow that he could not see—cringing from an enemy that never existed.

The principal thing that the district meeting does is to make members of the ice cream industry understand that the welfare of the manufacturers and the continued advancement of their industry depend upon knowing of each other and working together for common good instead of pulling, cringing and dodging in many directions. They teach us that there is nothing to dodge.

IF THERE is any lower form of animal life than that of a man who hides under a shroud of protection and bribes others to injure his competitors, it is not recorded anywhere under the list of double-D's—dirty digs. An ice cream manufacturing firm in the East complained, in a recent issue of its house organ, that certain young women suddenly and mysteriously began appearing at different soda fountains where its ice cream was served. Their tactics were much the same. One of these persons would order a plate of ice cream and dawdle over it until the soda stand was fairly well crowded with customers. Then she suddenly would discover that the ice cream she was eating was terrible, unwholesome, poisonous, and would shriek out her protests in such language that no one within the store would fail to hear. Always there ensued quite a scene, with no one passing up anything to be heard.

Scenes of this kind came about so suddenly, so frequently and were so similar in character that the firm manufacturing that ice cream was mystified. After noting that the ice cream in question did not so displease many other people—people known to be unbiased—this firm decided that some competitor had engaged a number of hawkers, who are low enough to do most anything for money. But, of course, that firm must have been wrong. Certainly no one could be base enough to do a thing of this nature. It is not conceivable that there

is a place in business for anyone so far beneath the contempt of a horse-whipper's lashsting. Of course, there are men who murder orphans, rob widows and slander women's fair names, but surely nothing like this contemptible thing could be done in business—not in the ice cream business, for it is even worse than the tactics of some of our dishonest oil men.

Men of honor just do not do these things, even though Anthony was generous enough to refer to Brutus as an honorable man after he assassinated Caesar.

IT WILL be noticed that the editorial pages of The Ice Cream Review have been extended. Sometime ago we realized that we could not cover all the things we like to tell our readers every month in the small space of two pages, and an additional editorial page was created. But there are so many different subjects to be discussed editorially that cannot be confined to short snappy editorials, it has been necessary since then to make use of the six pages that immediately follow the editorial pages. In this additional editorial space, it is our intention to work up discussions of important matters confronting the industry and to talk them over every month in just the same sort of way that you like to hear them discussed over a table surrounded by friends in the industry. The only difference is, our discussions are prepared after thinking over how men in different sections of the country view these matters, giving you the benefit of a complete digest of opinions.

IT IS not very easy to sing of a promised spring when there still is a lot of snow along the roadsides, but a few days can make a great change, and soon old Jack Frost will have vanished from the scene, leaving the flowers and the ice cream manufacturers in full sway. Wise manufacturers have not waited for spring to prepare for business, but on the contrary have been busy in late months with preparations to work up something more than the usual business that warm weather brings.

BULLETIN OF EVENTS

National Dairy Exposition—Wisconsin State Fair Grounds at the City Auditorium, Milwaukee, September 27 to October 1. Secretary, W. E. Skinner, 910 South Michigan Ave., Chicago.

Southern Association of Ice Cream Manufacturers—Twelfth Annual Convention, New Orleans, November 14 and 15, 1924. Secretary, J. W. Clopton, Decatur Ice Cream & Creamery Co., Decatur, Ala.

National Association of Ice Cream Manufacturers—Twenty-fourth Annual Convention, New Orleans, La., November 18, 19 and 20, 1924. Secretary, N. Loewenstein, 155 N. Clark St., Chicago.

Pacific Slope Dairy Show—Exposition under the auspices of the California Dairy Council with co-operation of dairy councils of the Western states and dairy divisions of the agricultural colleges and departments of the Pacific Coast states, Oakland, Cal., December 10 to 16 inclusive. Secretary-manager, Sam H. Greene, 216 Pine St., San Francisco.

Pacific Ice Cream Manufacturers' Association—Annual convention, Oakland, Cal., December 10, 11 and 12. Secretary, Ben H. Walker, Tacoma, Wash.

California & Southwestern States Ice Cream Manufacturers' Association—Annual convention, Oakland, December 10, 11 and 12. Secretary, Jay Kugler, San Francisco.

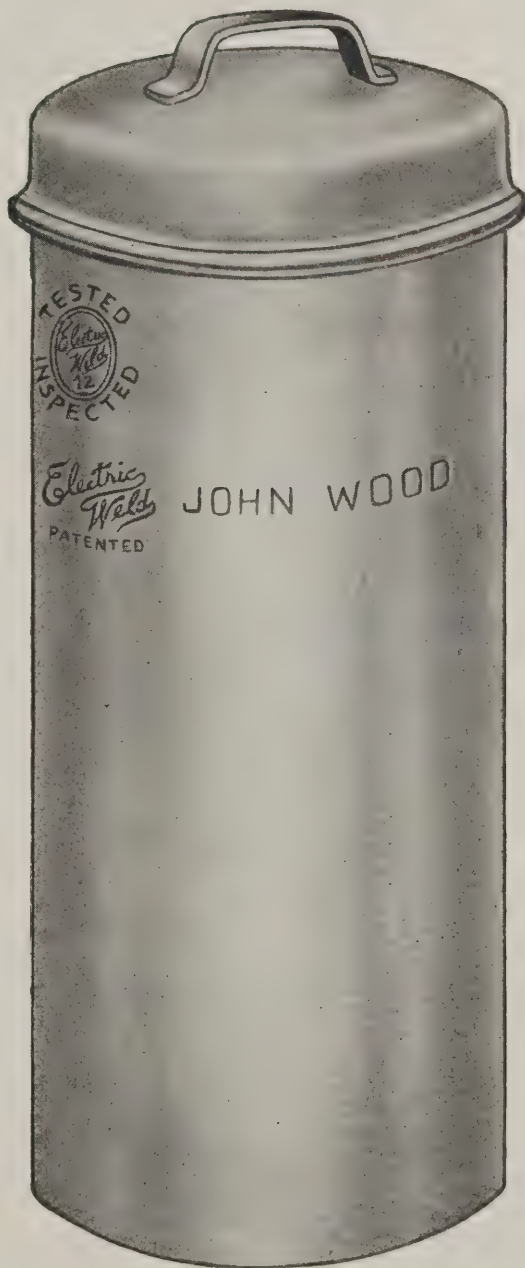

Supply Men of the Pacific Coast Ice Cream Manufacturers' Association—Exhibition in connection with joint convention of Pacific Northwest, Pacific Coast and Southwestern States, City Auditorium, Oakland, Cal., December 10, 11 and 12.

Georgia Ice Cream Manufacturers' Association—Annual Convention, Augusta, Ga., some time in December, 1924. Secretary, Sam Marshall, Marshall Ice Cream Co., Albany, Ga.

Arkansas Ice Cream Manufacturers' Association—Annual Convention, Little Rock, some time in December, 1924. Convention headquarters, Hotel Marion. Secretary, Charles H. Berry, Pine Bluff.

Darts from Our Friendly Enemies

Newspaper Stories Misrepresenting the Ice Cream Industry Should Be Promptly Challenged, Though They Sometimes Come from Well Meaning But Misinformed Men Who Stand High in Their Profession.

IT IS difficult to explain how men of high standing in matters concerning food industries can make so many blunders in discussing dairy topics. The ice cream industry really seems to be the greatest sufferer in this way. It is probably because the ice cream industry is most rapidly advancing over other branches of dairy manufacturing, but the public seems particularly willing to accept unfair charges against ice cream, its production, and its status as an industry.

Many find it difficult to understand that a food as dainty, appetizing and refreshing as ice cream can be sanitarily manufactured in up-to-date plants of the standard of those manufacturing other commodities, when, indeed, the ice cream factories of the country probably are far ahead of those of many industries, and are at least as sanitarily operated.

Several months ago the newspapers of Birmingham, Ala., carried, in startling headlines, the declaration that two children had died from being "poisoned" by ice cream. It was gratifying to learn that this report did not go unchallenged. As is the unfortunate custom of ice cream manufacturers throughout the country, many manufacturers operating in the Birmingham territory paid no attention to the inaccurate newspaper report, but an official of the Southern Association of Ice Cream Manufacturers wasted no time in getting down to facts. He wrote health officers in the Alabama city. This correspondence brought out the fact that one of the children did not even eat any of the ice cream served at the party where several had suddenly been stricken ill, while the ailment of the other was in no way traceable to ice cream. A newspaper correction soon was forthcoming.

DR. W. A. EVANS is regarded as one of the highest authorities on food industries in the country, being particularly well acquainted with the dairy industry. Men who know the work Dr. Evans has done in the interest of bettering conditions in dairy manufacturing are at a loss to account for the blunder he committed when he recently charged, writing for a chain of newspapers that patronize the Chicago Tribune's syndicate features, that "ice cream causes disease because of spoilage."

"There is nothing in the process of making ice cream which is destructive to bacterial life," Dr. Evans charged, adding—"If there is reason for milk ordinances and milk inspection, there is reason for ice cream ordinances—When ice cream ordinances were proposed a year ago the ice cream producers frowned upon them."

Several manufacturers of Minneapolis, Chicago,

cities in California, and other places where Dr. Evans' discussions are read, were prompt to register their protests and to set forth information which proved that the prominent physician had much to learn about conditions in the ice cream industry.

Now, the fact that Dr. Evans stands at the head of his profession made all the more damaging his charges against the ice cream industry, inaccurate though it was. Ice cream manufacturers many times have ignored false charges against ice cream in the newspapers, generally dismissing such occurrences with some such observation as, "Oh, everybody knows that is not true; people know how ice cream is manufactured."

We take much for granted in this life—all of s.

The average editor himself takes much for granted, and in this sense we speak from the viewpoint of the editor. Nobody, however, takes quite so much for granted as the average business man, particularly the ice cream manufacturer. The manufacturer understands his product and the process of manufacturing it so well that he gets it into his mind that everybody else understands his business just as well as he does. As a matter of fact, it is extremely unlikely that even a few of the next-door neighbors of the ice cream manufacturer know anything at all about the manufacture of this truly remarkable food dessert.

ONE of the most successful ice cream manufacturers in the country belongs to many civic and social organizations. He is recognized as a bright man among his friends in business. He has built up a splendid business organization. Yet, despite the fact that this gentleman mixes on free and easy terms with men who stand high in every walk of trade and profession, he was quite surprised one evening to hear one of his next-door neighbors, at a gathering of people, say, "What is that? Oh, you mean my neighbor—the ice cream fellow? Well, he isn't exactly in business, you know—he just makes ice cream."

That gives us something to think about. It gave the manufacturer in question something to think about, and as a result, the next time his Rotary club called upon him to make a speech on the ice cream manufacturing business at a coming event—an invitation that he many times previously had evaded—he accepted. And he told the story of the ice cream manufacturing business as clearly as it can be told by a man whose heart rankles with realization of how little his line of business is understood and how little it is appreciated.

(Continued on page 46)

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

A Cash Basis for The Ice Cream Industry

Collection Evils Long Have Menaced Welfare of Manufacturers. Widespread Elimination of This Abuse Sought on Eve of 1924 Campaign

CUTTING down credits and winning more business is the experience of several ice cream manufacturers who long ago recognized the pitfalls of the collection system but previously were afraid they could not eliminate this evil without greatly upsetting their business. It has been found that much of this dread of the credit bugaboo is nothing more than hokus-pokus, and that dealers can be made to understand that ice cream manufacturers must have their money promptly. The strangely interesting part of it is, manufacturers are finding that dealers not only will come across when told that the credit system is intolerable to them, but the dealers will take more interest in that manufacturer's product and "work" it harder, instead of becoming angry and looking elsewhere for his ice cream.

The collection evil is one of the most persistent that has ever confronted the ice cream industry. Manufacturers for years have groaned under the whiplash of inbusinesslike credit practices. It is one of the skeletons in the closet that most every manufacturer for many years dreaded to bring out for close scrutiny. Many manufacturers who by all the laws of business should have been making money have watched their profits melt out in the red-ink side of the ledger, with no apparent reason except that they were eaten up by the greedy lion of bad accounts.

It is evident that much of the nuisance of bothering over collections will be eliminated this year.

THE ICE CREAM REVIEW has conducted a survey of the situation and discovered that men who have made bold to beard the credit lion in his den, so to speak, have learned that dealers can be made to understand that there is no reason why the ice cream manufacturer should not expect prompt payment for his product and service just the same as the other men who supply the drug stores and delicatessens.

The strange psychology of the situation stands revealed when we see that the dealer who is reminded that he must pay his ice cream accounts immediately develops a greater interest in selling ice cream than ever before, and the manufacturer who makes his play for his money suddenly finds his dealer selling more of his ice cream and making more money for both the manufacturer and the dealer, without any losses through quibbling over accounts. It may be that the dealer, like most all human beings, better appreciates the product when the manufacturer himself shows appreciation of it. On the other hand, a dealer who knows that the manufacturer will not "crowd" him for payments often is tempted to pay little attention to the ice cream end of the business, and it is probably for this reason that so many dealers have tried to convince themselves that they handle ice cream just as a convenience to their customers and not so much for the profit.

It is a favor to the dealer to make him know that he must render unto Caesar. The dealer owes it to the manufacturer he represents as well as to himself to make every effort to dispose of more ice cream. He certainly owes the manufacturer the money due him for manufacturing and supplying the product.

The ice cream manufacturer who does not act to eliminate his losses through credits has no one but himself to blame for whatever unfortunate conditions come up. The experiences of manufacturers who have solved the credit problem show that the industry has reached that point in development where advanced business methods are necessary to every man who wants to be among those listed in the survival of the fittest.

SPEAKING before the Illinois state convention the past winter, Z. G. Gassman, retiring president of the association, said:

MENTION "THE REVIEW"—IT IDENTIFIES YOU.

Hitching the South's Wild Horses to Industrial Development

America's Greatest Undeveloped Resources are in the Mountains, Where Lie Kingdoms of Unbridled Power, Hidden Hosts of Mineral Wealth, Unbounded Acres Favorable to a Gigantic Dairying-Scheme, and Uncovered Treasures of Mental Power

THE mountains to the southward are in labor. People who understand the sleeping power within those vast storehouses of energy are greatly interested in what is to be brought forth. It is generally understood that America's greatest undeveloped assets are in the mountains. Minerals of untold wealth lie virtually unscathed barely beyond the plows of men who have toiled for many years under grievous handicaps. "Wild horses" of unreckoned power are dashing uselessly over vast expanses of waste that should be one of this country's richest fields of development.

News in the public print indicating that the government is to make disposition of Muscle Shoals has quickened the pulses of people who have been studying this mighty flood and have been looking forward to its commercialization, or rather industrialization.

A far-reaching urge for development has been sweeping the South in recent years, especially in recent months. A section of the country that has produced some of America's greatest builders has, by one of the strange tricks of fate, been struggling for many years for a way out of the wilderness of problems in its own unbuilt domain. European nations in distress are referred to by foreign correspondents to newspapers as waiting for "a man on horseback" to lead them to better things. The South is trying to work out a way to control its "wild-horses" of power that are escaping in the form of the mountain streams. Steps are being taken for the development of the South's great mineral deposits—many of them minerals to be found nowhere else; all of them minerals for which American industries are waiting. Clays that for a long time have been shipped to foreign countries to be made into pottery and crockery are being studied to the end that these manufactories may be carried on in the Southern states, as also clays, for brick, tile, porcelain, bauxite for aluminum, etc.

The South is bending strong efforts toward the development of dairying. Dairy development was discussed at the past convention of the Southern Association of

Ice Cream Manufacturers. Despite the fact that different delegates spoke optimistically over the outlook for dairying, a few of the manufacturers could not see the wisdom of offering the co-operation of the Southern Association of Ice Cream Manufacturers to that end. The association let the matter rest.

DEVELOPMENT of Muscle Shoals is the burning topic of the hour in the states below the Ohio River, especially in that section where are located the states of Alabama, Mississippi, the Carolinas, Tennessee and the adjoining regions.

While most observers see in the development of Muscle Shoals an event that would open the way to new industries for the South and the upbuilding of farm prosperity through the distribution of cheap fertilizers, dairy manufacturers of the South are not unmindful of the particular impetus it will give to their own industry.

The ice cream industry will benefit in many ways, principally, of course, through the building up of prosperous farm and industrial conditions. More industries will mean more money in circulation. This will mean more day laborers for that section, and the working people buy the most ice cream. Men with steady wages will increase the outlet for ice cream.

Agricultural development, of course, is the base of prosperity, and with industrial progress added, the Southern ice cream industry will have created for it favorable conditions similar to those which have made for the advancement of the ice cream business in the Northern states, such as Pennsylvania, Maryland, Massachusetts, New York, Michigan, Ohio, and other states where industries are flourishing.

Many, many years before prosperous cotton conditions were brought to an end, Governor Hammond of South Carolina, in pleading for industrial development for his section, said:

"Investigation would show that only the nations that developed commerce and manufactures, in addition to

Five Features that make Frigidaire

ICE CREAM CABINETS

a Sound Investment

1. Quickly Saves Its Cost.

It eliminates trucking and delivery of ice. For the retailer it brings freedom from the muss and dirt of salt and ice—no shrinkage or return of soft cream—no cream too hard to serve—no repacking.

2. Security.

The entire financial, research and engineering resources of the General Motors Corporation are back of Frigidaire Ice Cream Cabinets.

3. Dependability.

The Frigidaire Ice Cream Cabinet has the same cooling unit that has been proved satisfactory and dependable in Frigidaire—the electric home refrigerator. Thousands of satisfied Frigidaire owners attest its reliability in service.

4. Flexibility.

The Frigidaire Ice Cream Cabinet is adaptable to conditions in any store. The mechanism can be installed at either end of the cabinet—in the basement, or elsewhere as desired. There is a complete line, 4, 6, or 8 hole cabinets, to meet every need.

5. National Service Organization.

It has always been the policy of the Delco-Light Company to provide adequate service facilities for all of its products. A nationwide service organization assures satisfactory service when and where you want it.

You will only buy Electric Refrigeration once—consider these Frigidaire features before you buy—and buy right the first time. Full details and prices will be sent on request.

Playing the Week End Specials

Public's Love for Special Privileges is Luring Many New Customers to Ice Cream Counters. Many Manufacturers are Cashing in by Featuring Certain Flavors for Certain Times Window Flavor Streamers Help.

THAT old-fashioned habit of trying to build up your business by beating the other fellow out of his business has gone by the boards, as the gentlemen in politics would say. In other words, wise men in the industry have learned that the business which really stays on the books and counts in that column where the little lady with the horn-rimmed spectacles writes dollar marks in black ink is that business which neither you nor your competitor previously had touched.

Ice cream manufacturers of the country now are just on the threshold of some very interesting adventures in a field of conquest thus far little developed, though thoughtful men in the industry have been working in that direction for some time. Selling ice cream to the people instead of to the dealer is a development that has come about only recently. It has been discovered that ice cream is much the same kind of merchandisable product as anything else offered in the marts of retail trade, and that many methods successfully employed by other business men apply equally as well to ice cream.

Many manufacturers have long realized that the public was not being told the story of ice cream; that is, no one was taking as much frenzied interest in selling America's greatest food dessert as in telling of the merits of certain kinds of tooth paste, the potency of certain patent medicines, and so on. These manufacturers were going to correct that condition just so soon as they could get to it, but first they had some important matters to attend to; certain manufacturers had some customers that they wanted.

Far-seeing manufacturers, however, are bending their efforts toward getting lots of ice cream moved over the dealers' counter. The idea of promoting special sales hits the public in a responsive way. Southern California is not the only part of the country where manufacturers are cashing on the public's love for special privileges. The "week-end special" is being played extensively in the East and the Middle West, and on the eve of activity for 1924, there are many promises that this idea will be seized upon generally in the country, with Southern manufacturers taking interest in the scheme.

PLAYING the "week-end specials" means nothing more than advertising a special flavor for one certain day or days. Newspaper advertising calls the attention of the public, and it has been found that window streamers advertising the flavor to be featured serve to catch and hold the interest of passersby.

The "week-end specials" were "worked" harder last year than ever before. The Crane Ice Cream Company of Philadelphia determined to try out the plan. Results were so satisfying that it was continued, and officials regard it as one of the company's best forms of advertising.

Another Pennsylvania firm, the Smith & Clark Co. of Scranton, tried out the plan successively in different cities where it had stops. This company liked so well the idea of the window flavor streamers with which to push its week-end sales that it has used the streamer out of season as well as in season.

The Leichtman Ice Cream Co. of Hazelton, Pa., reports that it had a greater volume of business last year than ever before, and declares that all of this came about simply because it made an effort to develop sales among the people who have been backward about taking ice cream. They are greatly elated over results of their "week-end specials," which brought a record business in spite of extremely unfavorable weather.

Many ice cream manufacturers believe the window flavor streamer, simple device that it is, has gone far toward solving the problem of greater gallonage. One of the great difficulties is in getting the dealers to use their display material. All over the land manufacturers have advertising material cluttering up their lofty musty and dusty, and are at a loss as to how to get rid of it. That is where salesmanship comes in. The manufacturer cannot expect to sell the public on the idea of eating more ice cream unless he can sell the dealer on the idea that it can be done. The "week-end specials," according to manufacturers who have tried out the plan, give a strong talking point for enlisting the dealer's co-operation. The dealer, as all other average human beings, is strangely interested in any proposition which means money to him. Once that he sees ice cream moving over his counter and money dropping in on the ice cream side of his cash register, he is vitally interested in any advertising material anybody wishes to have him hang in his window to call attention to ice cream.

AN IMPORTANT feature of the "week-end specials" is the fact that many customers find themselves cultivating the habit of buying the product advertised in this connection. It works for consistency.

The first step in any plan to build up sales at the

REPORT OF COMMITTEE ON REFRIGERATED CABINETS BEFORE OHIO ASSOCIATION OF ICE CREAM MANUFACTURERS.

February 1, 1924.

YOUR Committee on Refrigerated Cabinets have gone into this subject as thoroughly as the limited information and data would permit, and beg leave to report.

That, whereas, during the past few years certain expensive practices have grown up in the business of marketing ice cream in that a great many dealers have sought to have the manufacturer furnish refrigerated cabinets, without cost to the retailer, and to install said cabinets in the stores and business places of the said retailers at the expense of the manufacturer of ice cream.

And, whereas an effort is now being made, by the retailer, to induce the manufacturer to purchase at his own expense and to install in the places of business of the retailer additional and more expensive equipment for the marketing of ice cream.

And, whereas said equipment and refrigerated cabinets are requiring the manufacturer to withdraw large sums from his active capital and to invest it in further and additional equipment for the benefit of the retailer and are thereby working a hardship on said manufacturer, it is therefore the sense of this committee that the following recommendations be submitted to our membership with the object in view of curtailing the practice on the part of the manufacturer of furnishing refrigerated cabinets to dealers and, insofar as is practicable to discontinue said practice in places where it now exists.

Your committee offers the following suggestions as a formula for mitigating the abuses referred to above:

1. That during the year 1924 no manufacturer furnish, or cause to be furnished, to a dealer any cabinet for ice cream shipped by express, traction or conveyance other than in truck of manufacturer.

2. That no cabinet be introduced by any manufacturer of ice cream in a city or locality where not now in use.

3. That a reasonable charge be made against the retailer for water and current in the operation of said cabinet whether said cabinet is furnished by the manufacturer of ice cream or the dealer; that free service for water and current on the part of the manufacturer be discontinued.

4. That in view of available data that the cost of ice and salt for icing ice cream ranges from 5c to 8c per gallon, an allowance of not to exceed 10c per gallon may be made to dealers who furnish their own cabinets and power where icing service was formerly given.

5. Your committee asks for the adoption of the foregoing recommendations and for additional time for the consideration of the several important points involved. We ask that no new commitments in the furnishing of mechanically refrigerated cabinets or fountains to dealers be considered until your committee has made a most thorough investigation and has further recommendations to submit.

Respectfully submitted,

Cost Accounting Systems

By HOWARD K. LEATHERMAN*

ACCOUNTING systems are now the subject of much discussion as pertaining to our industry and it is, therefore, behooves us to stop and ask ourselves, are we not doing our business and the industry as a whole an injustice, in the fact that this phase is being neglected. How easy it is for us to sit at our desk and make mental calculations. This is all in order if we have a study of actual costs and are in possession of substantial figures that will show this method to be correct. However, so often there is a discrepancy in our mental calculations.

All of you who have not at this time some system showing your costs from the time the batch is prepared and so on until the finished product reaches the consumer, are certainly working in the dark. Granted, you may be showing a very comfortable bank balance and your bills in good shape, but have you any method that will detect any excess operating expense, thereby making it possible for you to better such conditions and increase not only the efficiency of your organization, but also the final results?

For those of you who have a monthly system of operating report, the question arises, is the information contained therein, viewed in a perfunctory sort of way, or is the monthly story of progress taken rigid hold of by the managers, analyzed thoroughly, and then used as a basis for definite retrenchment or extension?

*General Auditor Cohn Ice Cream Co., Inc. Address before 1924 Annual Convention of New England Association of Ice Cream Manufacturers.

Have unit costs been worked out and studied as seriously and regularly as they should have been? A few items here and there have undoubtedly been studied, depending upon the particular hobby of a manager or superintendent. But it would be interesting to know to what extent statistics of real value have been built up, and used by executives who administer the practical affairs of operating.

From what has been written and said about costs per gallon manufactured, and costs per gallon of sales, an observer might conclude that with all this common unit of cost, operating expenses just begin and end. They probably do in some reports.

Every one of us spend each year monies to insure ourselves against various hazards and is there one of you who would not protect your business against a hazard of failure. One of the large credit rating houses says that four-fifths of industrial failures in the country are the result of faults or incompetence of one kind or another, and that ignorance of true cost of production is one of the most common.

A GOOD cost system properly conducted should enable the manager to operate with some assurance as to the final results. It should tell him what costs need special attention and enable him to gauge the efficiency if such exists. It should be his guide and counsellor in directing the activities of his business. On the other hand, care must be exercised that the system installed is not too complex and that the cost of secur-

Evangelism of Quality Sweeps South

Southern Manufacturers Steal Billy Sunday's Thunder
and Put Over Drive to "Hit the Sawdust Trail
of Quality." Better Ice Cream is Being
Made in South, "Evangelists" Say

H. A. CUSCADEN.

EVANGELISTIC methods to spread the doctrine of quality ice cream have been adopted by Southern ice cream manufacturers. Kentucky manufacturers stole some of Billy Sunday's thunder when they started out in February with a series of meetings to encourage ice cream manufacturers of Kentucky to "hit the sawdust trail of quality."

Quality was stressed as the Kentucky ice cream industry's greatest need for success at the two meetings of the Dairy Products Association of Kentucky in February, the first being held at Hopkinsville, February 15, and the second at Middleboro, February 20. These meetings were part of a determined movement to put ice cream "on the high plane where it belongs." The Southern Association of Ice Cream Manufacturers is encouraging meetings of this kind to hold interest in a high standard of quality.

The keynote of the Hopkinsville meeting was expressed by J. W. Clopton, secretary of the Southern Association of Ice Cream Manufacturers. He declared in his address that "the greatest thing that is being done for the ice cream industry today are the regional meetings or as I might better express it, the neighborhood meetings such as we have here today."

"The time has come when the ice cream manufacturer must conduct his business along business lines and he must be too big a business man to let his personal prejudice and hearsays that come to him from various sources govern his business policy."

"The ice cream manufacturers of the South are also making better ice cream, and most of them are making better ice cream than is required by their state standards. This condition is brought about by the desire to increase consumption throughout the South, and this is being rapidly accomplished. Gentlemen, let's be neighbors instead of competitors."

ONE of the leading exponents of the evangelistic program in the Southern ice cream movement is Harry A. Cuscaden of the Cuscaden Ice Cream Works, Louisville, Ky. Mr. Cuscaden attracted much attention at the past convention of the Southern Association of Ice Cream Manufacturers at Little Rock in December, when he spoke on co-operation in the ice cream industry, speaking on the subject "What's Dumber than a Dumbbell?"

"We hope that the seed we are planting today will grow into a large industrial tree, with its branches extending all over the United States, and loaded down

with nothing but quality ice cream," said Mr. Cuscaden at the Hopkinsville meeting.

"Just a few years ago ice cream was considered luxury and was used only in the summer, or on special occasions. The mother who bought her children ice cream was considered extravagant. Only a few factories were in existence, and very little ice cream was made during the winter. Today, ice cream is a health food and is eaten summer and winter. It is the wise mother who feeds her children plenty of good ice cream. There are thousands of factories making millions of gallons of ice cream daily."

"There is no reason why in the next few years, Kentucky should not have the lead in quality ice cream."

Mr. Cuscaden said that in one sense the ice cream manufacturer is the public's doctor. He declared the manufacturer is selling a health food and that the responsibility is on his shoulders to see that the product he sells is absolutely pure. The men who would make bad ice cream were branded by Mr. Cuscaden as criminals, "and we don't want them in the industry," he added.

"There are three reasons why we should make good ice cream. First, because it is a health food and it is the right thing to do. Second, it will increase consumption and naturally make you more money. Third, because it is the law."

"Common sense tells us, that in making something to eat, a food, it must be good and wholesome, not injurious. If it is good the public will eat more of it, and in turn we will get a larger return on our investment. The ice cream industry is still in its infancy, and in the next five years we will see some big changes. Gentlemen, don't let Kentucky fall by the wayside, let's keep step with progress, and set a high mark in quality ice cream."

MR. CUSCADEN declared that ice cream manufacturers should read the trade journals. He said they were full of good information. He spoke of the good work being done by the dairy schools and colleges. Sarah H. Vance, director of Bureau of Foods, Drugs and Hotels, State Board of Health, addressed the manufacturers on "Laws and Standards."

At the Hopkinsville meeting the ice cream industry of London, Corbin, Harlin, Knoxville, Middlesboro, Kentucky, and Jellico, Tenn., was represented. The manufacturers voted to meet at certain definite periods to perfect the organization of a Regional Club.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

District Meetings Proving Popular

Quality is Discussed in South, While Iceless Cabinets Come in for Most Discussion in West and Middlewest.

DEVELOPMENTS in the ice cream industry are featured by the spread of the idea of district meetings. District meetings have been held in a number of states in recent years, but in the past few years activities of this kind have been especially noticeable. It is in the Middlewest and the South that the idea of district meetings is the most popular.

The idea of district meetings was especially encouraged at different state conventions during the past winter. The Southern Association of Ice Cream Manufacturers heard the idea praised at its annual convention, and at the convention of the Ohio Association of Ice Cream Manufacturers resolutions were adopted and district meetings were provided for in the new constitution and by-laws. These districts later on will be given a number, but for convenience are called Cleveland district, Toledo district, Cincinnati district, Athens district, Columbus district, Zanesville district, Wheeling district and Canton district.

Under the direction of Secretary W. A. Wentworth of the Ohio association, meetings have been held in that state at which the principal business pertained to the name of the districts and suggestions regarding the territory to be included, and election of a chairman and vice-chairman, which chairman shall serve as a member of the board of directors of the state association. It has been determined in each case to hold regular meetings approximately every month in each of the districts thus organized, to promote a better situation insofar as the ice cream industry in that territory is concerned.

"The iceless refrigerated cabinet has done much to further the idea of district meetings. At the meeting held in Ohio in February, much discussion was given to the iceless cabinet and in each district there was adopted a report of the refrigerated cabinet committee presented at the state convention. In some cases additional solutions regarding the distribution of iceless cabinets have been adopted at the district meetings. On the whole, however, there has been a uniform expression of approval of this matter," according to Secretary Wentworth.

THE committee's report provided for the use of cabinets to be confined, at least during 1924, to the territory which has already been opened up, either by the ice cream men or the manufacturer of the cabinet. "It is felt that there is ample territory in Ohio to provide an outlet for all the cabinets made in 1924 without going to the territory which would only cause tremendous inconvenience and uncertainties for the ice cream manufacturer," according to Mr. Wentworth.

Much attention has been given at the district meetings to the quality of ice cream, especially in the district meetings held in the Southern states. In the South the meetings were in line with the matter discussed at the Southern convention regarding a standard of quality to be upheld in carrying out the association's advertising program. Quality, however, has come in for much discussion at district meetings in the Middlewest.

Districts thus far organized in Ohio are as follows: Cleveland—J. H. Schindler, chairman, and Mr. Magel vice-chairman.

New England Ice Cream Industry

Thirty Years of Progress Through Quality and Co-operation

1924

Yesterday and Today in the New England Ice Cream Industry

TWO men in the ice cream industry in New England have a lot of fun every time they go to a convention and hear manufacturers talk over their troubles. It is not that these men themselves do not have any troubles in their plans once in a while, but they can look back over a span of thirty years and recall some real troubles, such as boiling the vanilla bean in cream to make vanilla ice cream, chopping ice by hand, working half of one night to fill a special order for twenty-five gallons of ice cream, an average of sixteen hours a day toiling over tub freezers operated by hand, and no definite time to go home, except to work until everything was done, and "everybody happy."

W. P. Sutton and C. E. Davis are the oldest members of the New England ice cream industry. The former is head of the Mansion House Ice Cream Co., Cambridge, Mass. Mr. Davis is head of the firm of Davis Ice Cream Co., of the same city.

THE foundation of the Mansion House Ice Cream Company, Cambridge, Mass., was started in 1886 in the old Mansion house, an old-fashioned New England tavern, at that time over 100 years old. Old-fashioned tub freezers, hand power, were used. The output was first served with meals as a dessert. Later an ice cream parlor was added, and then a catering department was included, all of which required a larger output of ice cream. The public liked the product and we were successful as the little business advanced. Several alterations and changes were made as we went along.

The wholesale end of the business started about 1894. A few local retailers requested that they be supplied during the summer season. Delivery was made in tubs,

no icing service in those days. The volume was small. The retailers would start to serve ice cream in June and discontinue in September.

THE original room where manufacturing was begun was about 12 x 20 feet.

"Our investment at that time was about \$300 to \$400," relates Mr. Sutton. "The greater part of the was in tubs and cans. In 1904 we decided to enter the wholesale market in a larger manner and that also proved successful. Gradually we discontinued all other branches of the retail business and in a short time we did not have room enough in the old place to take care of the flow of business we were receiving.

"We then wanted a new and larger plant so in 1907 we laid out plans for a new factory and in 1914 moved into our present building, 60 x 100 feet at three stories high. A garage is now connected, 45 x 10 feet, and two stories high. The upper floor of the garage is used for storage and repair shop for tubs, cabinets and cans.

"In the early days of our entering the ice cream industry, early in May we would get out the old hand freezer and make the necessary repairs, also the tubs, etc. We had no cabinets in those days. All the stock was carried in tubs. About the first of October we would close the ice cream department until the next spring.

"In the old days nearly all ice cream men had their secret formula. Fat solids, bacteria, etc., were not thought of. The national and local associations, with the assistance of our health officials, have been the means of bringing up the industry to where it is today.

For Lasting Satisfaction

York
Refrigerating
Equipment

One reason why there are so many installations of York Refrigerating Equipment is that its satisfactory working condition does not pass with the seasons. York Equipment does not mean satisfaction until the first signs of wear show up, but a year in year out dependable service that stands the strain of rush seasons without injury to its long life.

Let us show you just why York Equipment lasts longer.

Shrewd and Capable New England Ice Cream Manufacturers Use U. S. Heavy Duty Freezers Then Order More as Their Business Expands

The Turner-Centre System

The Turner-Centre System tried out a 120 Quart U. S. Heavy Duty Freezer in their Boston Plant. They found that under the same conditions the U. S. Freezer turned out finer grade of ice cream than all other freezers they were using at that time. So they ordered two more for their Boston plant, which is shown here, and also ordered U. S. Heavy Duty Freezers for their plants in Providence and Lowell.

TURNER-CENTRE SYSTEM.
Plant in Boston, Mass.

Showing three 120 Qt. Capacity U. S. Heavy Duty Freezers.
They also use U. S. Heavy Duty Freezers in their
Providence and Lowell Plants. Note U. S. Automatic Batch Weighers.

The Maine Creamery Co.

The Maine Creamery Company of Providence, R. I., desiring to install new machinery the very best and most efficient kind, carefully investigated all makes of freezers in 1920. They finally selected the 120 Quart U. S. Freezer, and ordered one on a trial basis. This was so satisfactory, that they immediately ordered three more, making four altogether which they now use.

KELLEY ICE CREAM CO.
Plant in Providence, R. I.

The 3 Majestic 60 Qt. Capacity U. S. Heavy Duty Motor Driven Freezers they last ordered are shown here. Their original installation consisted of 3 Commercial 40 Qt. Belt Driven U. S. Heavy Duty Freezers.

The Kelley Ice Cream Co.

Mr. Kelley, of the Kelley Ice Cream Co., is a man of wide experience in ice cream manufacturing, and immediately selected U. S. Heavy Duty Freezers when he started the Kelley Ice Cream Company. His first installation consisted of three 40 Quart U. S. Freezers. The business grew rapidly, and he soon placed an order for three 60 Quart U. S. Heavy Duty Freezers. These are shown in the picture to the left.

What Cheer Creamery Co.

After having used two 120 Quart U. S. Heavy Duty Freezers for a year, the What Cheer Creamery Company got into a difficult situation on account of an overwhelming increase in their business during a hot spell. They called us up by long distance, asking us to send them at once another 120 Quart Freezer of exactly the same type they had.

Satisfied Successful Users Everywhere

We will gladly give you the names of those near you, so you can ask them what they think about U. S. Heavy Duty Freezers.

product is made today in clean and sanitary, inspected factories. Ice cream is now considered a staple food product, where in old days it was thought of as a luxury."

THE Davis Ice Cream Co. entered business in April, 1885. All vanilla flavoring was obtained by boiling the bean in cream. Strawberry and pineapple juices were put down in season and kept in ice chests until used. The manufacturers started breaking ice in season and kept it in ice chests until time to use. There was a huge bin affair with a cement bottom in which the ice was kept, the ice breaker straddling the box to break the ice the right size with a large mall.

The old way was to put all merchandise in the cellar and then lift it out as needed. There was no Sunday work for several years, and the wholesale business was virtually unheard of until about 1890. The one horse used by the Davis Ice Cream Company in summer was put out for keep in the winter months. Power was then produced in the form of a water motor for 1 cent to

the 10-gallon freezer, it sometimes being necessary to give "a pull on the belt to bring a batch to completion." Later there was a gas engine large enough to run two freezers. The procedure was to freeze the batch, pull out the freezer and then dump all the ice and brine on the floor to run down into the sewer, then dump all the ice cream from freezers into 20-gallon cans. The mix then was iced up over night and dipped into separate 1-gallon and 6-quart cans the following morning. No can larger than one gallon cans were known for years in the wholesale business. Vanilla and strawberry were the only flavors.

IN 1900 E. G. Davis paid \$50.00 to be taken through one plant and afterward brought from New York an ice cream cabinet and 25 one quart double covered bricks which was the start of the individual brick business of Boston. About this date the first ice cream frozen by brine was made in Cambridge and was frozen in gude tubs with a coil of brine pipe around the inside and partly filled with a brine. It didn't prove very practical, according to Mr. Davis, but it was a good thought and developed fast until today.

* * * * *

"Quality" is Weapon of Ice Cream Manufacturers Down East

Spirit of Co-operation is Highly Developed. New England Association has Served Toward Progress of Industry

THE ice cream industry probably is in healthier condition than any other line of activity in New England. The progress and continued well-being of the ice cream manufacturing business is one of the bright spots in a situation that has greatly perplexed New England industrial leaders in recent years, what with the South taking away the New England mills, St. Louis gobbling up the shoe factories of the gentlemen down East, and the port of New York getting more than its share of the shipping.

Probably it is because the ice cream industry got an earlier start along the Eastern seaboard, but the fact remains that members of the industry in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut have been very alert in promoting the "frozen beverage" in public popularity, pursuing a rigid course of quality production in working to this end.

More than fifteen million gallons of ice cream were made in New England last year. The progress of the industry in that section is interestingly related in an

editorial that appeared in the Boston Evening Transcript at the time of the 1924 convention, which follows

"Embodied for all time in song and story is the roast beef of old England. Where is the poet to sing of the sweet and cooling influence of the ice cream of New England? The statistician is at work, but few can discover the poetry in figures. He is laying the groundwork for poet of more limpid measure, who shall tell the tale of ice cream in soothing and melting cadence. But the story of the statistician is no without interest. We read in connection with the proceedings of the New England Association of Ice Cream Manufacturers at their session in Boston that fifteen million gallons of ice cream were made in New England last year. Presumably it was eaten here. It represents consumption of about two gallons per capita.

"Here, perhaps, is food for cool reflection by that body of investigators Governor Cox would have appointed to study the New England food supply. The ice cream manufacturers say that their product is winning deserved recognition as food rather than as a mere means of tickling a parched palate. The fifteen million figure bears out the assertion. It is further explained that ice cream when not too cold is excellent breakfast food. Why not meet complaint that New England imports too much food by increasing consumption of ice cream? Here is home-made product, nutritious and pleasing to the taste. It appeals to youth and age. It is the solace of the invalid and the comfort of the man immersed in the affairs of business. In supply it is ubiquitous. Black-coated waiters serve it in dainty glasses at the tables of high-priced hostelry. It is compounded in weird—not to say alarming—combinations at countless soda fountains. And from the forests of the Aroostook to the shores of Long Island Sound the humble ice cream cone is in evidence.

"What, then, more appropriate than consideration of ice cream as an established element in the regimen of New England? And it is to be noted that the production of ice cream in this part of the country expands while the production of other foodstuffs declines. Not without interest is the name of this association now in session here. It is an organization of 'manufacturers.' The making of ice cream has taken its place among the major industries in connection with the food supply. It is conducted in many cases in large establishments equipped with devices unknown to the man whose knowledge of the process of making ice cream is confined to recollections of boyhood struggles with balky freezer. The ice cream manufacturer has along with his mechanical appliances developed his selling methods, as is shown by the fact where

OWOSSO,

MICHIGAN

the traveler may roam in these United States there is to be found this distinctively American product. Give the ice cream maker his due, not only as business man but, in many ways, as benefactor of all sorts and conditions of men."

While the New England states do not approach in volume anything like the production of those extraordinary states of Pennsylvania, New York, Maryland and Ohio, they are right in the top ranks in up-to-date plants, progressive business methods and sincere efforts to promote quality.

Some of the nation's finest ice cream plants are located in New England, and while the time long has passed when proud old Boston can be called the hub of the country, it is indeed the hub of a remarkably active ice cream industry, numbering among it many of the nation's leaders in this line of activities.

PROBABLY nowhere else in the industry is the cooperative spirit so highly developed as among the New England ice cream manufacturers. The idea of organizing the New England association developed at the first meeting of the National Association of Ice Cream Manufacturers. The National association many times has seen fit to draw upon its Yankee sons from down East for officers and committeemen.

New England ice cream manufacturers were present at the first convention of the national association, held at Memphis, Tenn., in 1909. It was several years following this meeting, that steps looking to a regional organization for the New England states were taken. A meeting was held on March 28, 1920 in the offices of the Davis Ice Cream Co. of Cambridge, Mass., and the following officers were elected:

President, J. N. Gurdy, Jersey Ice Cream Co., Lawrence, Mass.; vice-president, W. P. Sutton, Mansion

House Ice Cream Co., Cambridge, Mass.; secretary, F. Kronenberg, Neapolitan Ice Cream Co., Cambridge Mass.; treasurer, W. H. Snow, Snow Ice Cream Co. Somerville, Mass.

The meeting was attended by W. P. Sutton, J. N. Gurdy, W. H. Snow, E. G. Davis, Claude E. Davis, Frank Kronenberg, Harry C. Tait, C. G. Morris, Harry Harwick, Samuel Dolbey, F. W. Bartlett, T. D. Cutler and Dr. E. G. Eckert.

APPARENTLY this was about the time of standards etc., legislation as in one place there was a discussion as to whether bakers or confectioners should be admitted to the association. According to the minutes the principal agreement in favor of taking them in was that "they can help us fight."

It may seem rather strange to us at present to find that one of the members at the first meeting, suggested that ice cream be considered a dairy product. Apparently the industry itself hadn't determined whether ice cream was a confection or a food product.

The first annual meeting was held in 1911 with about 20 members present. From this time on the association has taken an active part in all things of interest to the industry in New England, working together, watching legislation and actively supporting anything that could build up the industry. As times have changed the activities have changed and there has developed a better and better spirit among New England manufacturers. During this time the New England manufacturers have supported the national association in every way possible. Last year at Cleveland there were 90 in the New England delegation.

It is felt that material progress has been made in the association work since the employment of an executive secretary in 1922. It has been possible to do things that were not possible on account of the time involved when a member secretary had the work to do.

From the start in 1910 the development has been steady until at the 14th annual convention held in Boston, January 22 and 23, 1924, there was a total registration of 317, 355 sitting down to the banquet.

Touched.

It was a soiree musical. A singer had just finished "My Old Kentucky Home."

The hostess, seeing one of her guests weeping in a remote corner, went to him and inquired in a sympathetic voice:

"Are you a Kentuckian?"

And the answer came quickly: "No, madam; I am a musician."—Montreal Gazette.

Co-operation with Competitors Brought Success to New England Firm

By Co-operating with Neighboring Manufacturers, The New Haven Dairy Co.
Helped to bring About a Quality Standard that Increased
Popularity of Ice Cream

STRANGE as it may seem, the unparalleled success of the New Haven Dairy Company in the milk and ice cream field has been due entirely to co-operation with competitors as well as with the public. The records of this company, dating back to organization in 1906, bear out this claim to its fullest extent. Beginning business with a capital of \$65,000 the company purchased the assets of the New England Dairy Company, which had dismally failed. Today the capitalization is \$878,000, with branch plants in a number of cities. Of the original officers, Charles G. Morris and G. B. Platt still are at the helm, Mr. Morris as president and Mr. Platt as general manager.

The annual turnover in ice cream figures has been increased to over one and one-half million gallons, while the sale of milk, which was 493,298 quarts during the first year, stands at 5,025,649 for the past year.

In 1906 the company had an ice cream factory in New Haven and a distributing branch in Hartford. It bought land and built a modern brick factory in Hartford in 1909. In 1915 it did the same in Waterbury and New Britain. In 1916 it bought and remodeled a frame factory building in Meriden, and in 1917 at New London. It has just completed a brick and concrete building in

Bridgeport and it has shipping stations in Middletown and Norwalk. In every building were installed the most sanitary and efficient machinery and equipment which it could discover. It was the first ice cream concern in this state using a motor truck, and today it has in its service a fleet of 111 trucks and cars ranging from five ton trucks to the humble Ford delivery and salesmen's runabouts.

THE officers of the company have always been ready to assist any ice cream manufacturer in trouble of any kind. Magnanimous as this seemed there was some selfishness behind it. The aim was to get upon the market a product of high quality and clean public expectation, irrespective of who made it. Every improvement in method or manufacture was freely communicated to competitors. The company has been very successful in making such improvements and profited accordingly. The officers of the company also got busy on the other most important end of the program.

Ice cream was advertised extensively. The public was educated up to the point that ice cream was a pure and wholesome product, no matter who the manufacturer was. Of course they emphasized the fact that New Haven Dairy ice cream was best. The public soon was convinced of that fact and ice cream consumption increased by leaps and bounds, while the New Haven Dairy Company came in for more than its proportionate share of the business.

To maintain this condition the officers are putting forth every effort. Frequently the public is asked by way of street car and newspaper advertising to visit the factories. Thousands of persons have availed themselves of this opportunity. They invariably carried away the impression of white robed workmen and clean floor and machinery. Even though the New Haven Dairy Company can not make all the ice cream, the visitor realizes that it does make ice cream of highest quality.

The same spirit holds true of the milk end of the business. Thus there has been almost no friction among the producers. Not one of them is trying to injure the business of the other. The New Haven Dairy Company never fears to spend a dollar, part of which will help its competitors. These latter have come to realize that the policy of their friends is a sound one, and the result is uniformly high grade ice cream at all sales stands.

PIONEERS in the installation of machinery of special design, this company has continually urged others to do likewise. The result is that all manufacturers are saving money in the way of production cost which are in turn reflected in the cost to the consumer. Outstanding features are machine refrigeration, dry cold storage, sanitation and fly-proofing. In the main plant at New Haven the company has a battery of freezers, capable of making 120 gallons of ice cream in 14 minutes. Two of the branches have similar capacities.

Another method which proved of inestimable benefit to all concerned is the close co-operation with the supply houses and farms. Milk comes direct from the farm to the plants under special contracts, being brought

EVERY AD IN THE REVIEW HAS AN INTERESTING MESSAGE FOR YOU.

daily on a train specially iced. Milk producers are vying with each other to get a contract from the New Haven Dairy Company, because it means an honest return and it also means less work for them.

By less work is meant that the company, by its special machinery, returns the cans to the farmers completely washed and dried. An idea of the extent of the employment of machinery can be gained from the fact that 20,000 milk bottles are washed every day. A special run is made on pasteurized milk. It is also

specially advertised, and the public today is learning that pasteurized milk is the only safe milk.

Many of its employes are experienced hands because they stay there, not only on account of humane treatment, but because they have an interest in the profits. A bonus is paid to employes annually, which is based on their salary for the past year multiplied by the number of years of service. The oldest employes may get a twelve per cent addition to their year's salary in a good year.

Development of Connecticut Ice Cream Industry

Insanitary Methods Outlawed in State That Has Made Tremendous Strides in Quantity Production Through Adherence to Quality

By CHARLES G. MORRIS*

IT WOULD be impossible for me to cover the progress made in the industry in this whole New England section. Since the beginning of my acquaintance with ice cream it has grown from a trifling to a great industry. From the time when the "slogan" first appeared in the agents' windows, "Take home a brick of ice cream—will keep hard one hour," to the

CHARLES G. MORRIS.

present universal use of ice cream in the home, seems a far cry, and yet it is a span of less than two score years in most New England cities. If readers desire a statement of present conditions in Connecticut, I can summarize them after a fashion.

At present Connecticut is fairly well represented among manufacturers of ice cream as to number. There are no less than nine of the more conspicuous concerns doing business in modern plants in this state with high ideals as to sanitary equipment and quality products.

Naming these in alphabetical order they are the Cebrook Ice Cream Company of Hartford; Hartford Ice Cream Company of Hartford; Huber Ice Cream Company of Bridgeport; Harris-Hart Company of New Haven; Millbrook Company of Middletown; New Haven Dairy Company of New Haven; Semon Ice Cream Company of New Haven; Tait Brothers of Springfield, Mass., who have a plant in New London; R. F. Worden and Sons, Inc., of Waterbury.

* Head of The New Haven Dairy Company, New Haven, Conn., and past president of the National and New England Associations of Ice Cream Manufacturers.

In addition to these there are a number of manufacturers of good repute who belong to the progressive group included in the local association work as follows: Vonetes Bros., Ansonia, Conn.; The Reichert Ice Cream Company, Bridgeport; The Rider Ice Cream Company, Danbury; The White Rock Ice Cream Company, Forestville; The Naugatuck Dairy, Naugatuck; Manchester Dairy Ice Cream Company, South Manchester; The Torrington Creamery, Torrington; Michael Whalen Conf. and Ice Cream, Waterbury.

IT HAS been the policy of the leaders in the state for many years to consider that there is always room for any manufacturer who goes into the business with the idea of making a better product than the rest of us. Such a one to be successful must sell at or above the average price. He must boost his own cream and by so doing he boosts the whole industry. The man who cuts prices or knocks his competitor will in the long run prove to have been cutting his own business throat, too, or knocking his own business in the head.

Moreover, in meeting clean competition the rest of us have to get out and do more boosting of the industry in general as well as our own product—which helps him, too. In the long run such a condition is good for all concerned and our general situation here in Connecticut shows that fact. So far as we know, the industry has developed to a steadily increasing volume of profitable business for all who are in it.

Physically our Connecticut ice cream plants compare favorably with any group I have seen in the United States—and this country leads the world in ice cream making. The larger plants are uniformly equipped with artificial refrigeration and are housed in beautiful work rooms. The best of them are fireproof construction, floors impervious to moisture, white tiled or cement plastered side walls and modern sanitary machinery at every point where labor can be saved and sanitation improved by its use. Probably fifteen or more of the ice cream plants in this state conform to this description. The rest are less pretensions, but are under a system of inspection by the State Dairy and Food Commissioner, which holds them to a reasonable degree of sanitary condition and operation.

Connecticut has outlawed the filthy cellar dump, where a few gallons of questionable mix is frozen to be peddled over a counter or on the streets. These places start up from time to time, of course, but are soon located and made to clean house or discontinue making so delicate a food as ice cream. The result is that on the whole our Connecticut ice cream supply is as good or better than that to be found anywhere in the country.

Truck Transportation

Motor Truck Means Outlet for Dairy Products, Speeds up Service, Eliminates Unnecessary Handling of Products and Permits Dealers to Establish Transportation System Under Own Control

*By F. W. FENN**

THERE are three forms of transportation open to you men of the dairy industry, viz: Rail, motor truck and horse and wagon. The steam railway is adaptable for long distances, if it is feasible to ship ice cream long distances. The motor truck for distances up to 100 miles and the horse and wagon for short distances. The waterway does not offer possibilities for the transportation of your product for the reason that it is a perishable product.

I will try to compare the motor truck with the other forms of transportation and of course I will expect to show you how it can be used to advantage.

1. It gives a market outlet for your products hitherto unknown because of the distance between the producer and the market and the lack of transportation. I refer to the markets lying in the back country contiguous to your center of production. Many small towns may be made greater consumer territory through the motor truck as a transportation medium.

2. Transportation of your product to the consumer more quickly and in better condition than is possible under other forms of transport. It can be operated to suit your own convenience and is not subject to long delays.

3. Elimination of unnecessary handling involved

* With Service Motors, Inc., Rochester, N. Y. An address before Indiana Dairymen's Convention in December.

MILLER Refrigerator Bodies

"We SELL you one — you BUY more"

After using one Miller Refrigerator Body in 1923, the **Luick Ice Cream Company** of Milwaukee has purchased three more for immediate delivery.

THE JOSEPH MILLER COMPANY

*Manufacturers of Refrigerator Bodies and Ice Cream Cabinets
Using Miller Patented Tanks for Refrigerating*

919 Third Ave. North

Minneapolis, Minn.

when shipping by rail. Handlings reduced from four to six handlings to two.

4. Establishment of a more direct connection between the producer and the market. Permits of a direct manufacturer and consumer business at a distance from the factory.

5. Permits you to establish a transportation system directly under your own control, free from labor disputes, in which you have no voice of strikes and embargoes, and other delays which might seriously impair your business.

6. The substitution for the disinterested and limited liability of other forms of transportation on the short haul with an agency of your own which personally collects and distributes your product, thus performing marketing as well as transportation functions.

Of course many of you use horses and no doubt in many cases in your work the horse has his place, but I wonder if you have studied the motor truck and its possibilities as a profit producer? We will grant that on a crowded city street, where many horses are employed, a motor truck loses its chief advantage, that of speed, and that in a door to door proceeding the horse looms up and has a decided advantage over the motor truck, but it is possible to divert your motor truck to less crowded thoroughfares if you are endeavoring to reach points beyond the crowded business section, while if your deliveries are to outlying stores and are sufficiently distant apart, and I presume they are in your business, the horse becomes a more expensive proposition, as I shall endeavor to show you presently.

This is also true of the business section where traffic is at its highest point of density, provided the stops are far enough apart, and from my observation they should be in your type of business.

I presume many of you have asked yourselves the question, "Shall we install motor trucks or continue with horses?" I know it is hard to change from old established methods to new ones. As a boy I remember how hard it was for my grandfather who had been a farmer on a large scale all his life to change from oxen to horses and how he nearly killed a man who tried to sell him a mowing machine. For years during harvest he continued to employ fifty men with scythes to do work which could easily have been done with one man and a pair of horses. When he sold a ton of hay at the market price he could not understand that he had a high productive cost tacked on to his product and that he was not netting as great a profit as the man three miles up the road who was employing newer methods in his production.

NEWSPAPER publishers have found that news becomes old so quickly that they had to speed up the distribution of their papers or fall behind the times. Coal dealers found that they could haul greater loads with trucks, that the horse was falling down under the greater demands of the industry and the household that icy streets were a severe detriment to quick delivery and expanding business. Coal and newspapers are now dispatched in motor trucks, just as trains are sent out from the Grand Central Terminal. But you know the story, it is plainly written in every city and

WHAT ABOUT EQUIPMENT FOR SPRING AND SUMMER—READ THE ADS.

on every street in those cities. The motor truck is displacing the truck in almost every industry.

In measuring the efficiency of the motor truck, the horse is usually employed as the standard of measurement. The yardstick of horse costs, the performance and endurance of horses, the radius of operation, time factors, etc. Before I attempt to present to you the merits of the motor truck and its possibilities in your industry, I should like to give you a few examples based on the measurements above referred to.

Hoard's Dairyman gives the following interesting comparison of the horse and motor truck in the hauling dairy products. It is a time plus cost study worth thinking about. Compiled from an average of 1,000 dairy farms answering with questionnaires.

Number of hours away from farm: Horses—7 hours 56 minutes; Truck—1 hour—54 minutes.

Number of minutes standing: Horses—54 minutes; Truck—26 minutes.

Average speed miles per hour: Horses—2.82 miles; Trucks—10.04.

Cost to deliver load, 28 cans of milk: Horses—\$7.56; Trucks—\$2.52.

Cost to deliver one can: Horses—\$.27; Trucks—\$.09.

The United States Department of Agriculture states that a truck makes 2.9 trips to .9 of a trip by a horse and wagon on the average and hauls 57 bushels of corn to 26 by wagon at a cost of 17 cents per ton a mile as compared with 49 cents by wagon. These figures are for this section.

When a team owner with a large equipment changes over to motor trucks and saves \$25,000 for instance, is it not an admission that in all likelihood by his

delay in accepting motor trucks sooner he lost approximately \$25,000 a year for several years?

A LARGE company in Pittsburgh had this experience. Had they known what their horses were costing them they probably would have made the change earlier than they did. They bought their first truck in 1919 and have purchased nine since. They have kept accurate cost records and this had brought the pleasant realization—I will quote what they said:

"Our records show that compared with delivery by horses our operation of these eleven trucks shows a net profit of not less than \$15,000, or reduced delivery cost of not less than \$20,000 a year."

In figuring team costs, this firm figures \$12.00 which covers feed and stabling a team of horses which includes stable boss and helper, driver, depreciation of wagons and harness, depreciation on horses, repairs and horse shoeing. They figure two heavy wagons at \$1,000, a set of harness with collars at \$140, making a total of \$1,140. Depreciation is figured at 12 per cent a year which averages \$.45 a day to the team. They figure that a team of horses weighing about 1,600 to the horse costs about \$700,000. One of their officials states: "Our records covering 150 horses show the average life of each horse to be 53.5 months." They should depreciate at the rate of 24 per cent in the \$12.00 a day cost.

This company does not figure cost of investment, superintendence, clerical help, office rent, telephone, stationery, office supplies and insurance which the company charges against its motor trucks. Furthermore each truck was graded with a tonnage delivered at the rate it costs to deliver by horses. They keep the truck moving day and night and have set up a record when one truck delivers in one day as much as can be delivered in a week with horses, or rather I should say, can be delivered by 20 horses, and when the streets are covered with ice they say it is nearer 30. A large retailer gives as reasons for change from horses to motor trucks the following:

Was losing business to competing firms which use motor trucks. Found that trucks were displacing horses in nearly every line. Found that he could cover twice the ground with trucks than he could with horses. Found that he could reach distances which were never within his reach before. Found they brought more business, and made more frequent deliveries and gave better service to the customer. With proper care trucks could be kept on the job every day 24 hours if necessary and a horse only half of that time. Never kept horses but feels he lost money with them and saved money when he installed his motor trucks. Found that each truck replaced three horses and cut down number of men on the payroll. Found that his investment in trucks has yielded big dividends in money saved but that the greater dividends have come in the way of increased efficiency in his delivery service and greater satisfaction of customers; to all horse users he says "Use Trucks."

The New Solderless - Rivetless

Ice Cream Packing Can

RELATING to riveted and soldered Ice Cream Cans "Buhl Quality" has for thirty-five years been the standard upon which real worth and value have been measured. The same confidence will apply to the new "Buhl Electric Allweld" Ice Cream Cans.

"Allweld" Cans are assembled complete before tinning. They are then thoroughly and smoothly "Hand Tinned" by immersing into several baths of absolutely pure molten "straits" Tin. This protective coating or plating of tin along with the special steel used, made under a formula known to have exceptional rust resisting qualities, insures a Can capable of withstanding the corrosive effects of salt and brine.

"Allweld" Cans are made throughout of the best steel procurable—of a very stiff nature (not overly hard) but just the right temper to withstand the severest service—difficult to dent thus insuring "Allweld" Cans retaining their original form and capacity.

Should it be desired to retin the "Allweld" Cans after long service it can be done easily without disassembling.

Beaded Top Hoop
—Electrically welded to cylinder, cannot be removed—forming double thickness absolutely sealed tight into solid mass at top edge by tremendous pressure.

Extra prominent bead—easy to grip—edge sealed tight—no solder.

Cylinder side seams continuously electrically welded—much superior to gas welding as does not crystallize metal. Smooth and sanitary—no solder.

Bottom pressed to side of cylinder with 200,000 pounds pressure by a special process avoiding fracturing or crystallizing the steel. Electrically welded to cylinder—no solder—perfectly smooth, no crevices. Flange of bottom extends to bottom edge of cylinder.

Bottom hoop—heavy gauge band steel expanded on inner flange of bottom forming triple thickness of heavy steel at bottom, protecting bottom edge from damage. Bottom hoop electrically welded to can. Perfectly tight—no opening.

Patent applied for.

Tin-Okeh

-the Leading
WELDED
Can

**Heavier
Stronger
Easier to Re-tin**

A Running Mate of the Famous Solar Soldered "Ultra"

THE Solar Tin-Okeh is built for those who want a stronger, heavier welded can that can be easily and perfectly re-tinned — by one of your own workmen.

The Tin-Okeh has the powerful, triple folded top band—thicker, heavier and stronger. It has a 16 gauge top— and the strongest bottom and chime ever built on an ice cream can. The Tin-Okeh is water-tight before it is tinned. No seams to re-solder—it can be re-tinned in your own plant.

"Tin-Okeh" is the can for you—if you prefer a welded can. It's stronger, gives longer service—and pound for pound it is 10% lower in price.

If you want a soldered can, choose the Solar "Ultra"—the most popular ice cream can made.

SOLAR
ICE CREAM CANS

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

It is made up of the following items: Depreciation interest on investment, insurance, garage, driver's salary, taxes, license, maintenance, etc., while variable includes tires, gas and oil.

Ton mile costs are important when carrying a full load and certain distances. The formula, distance plus time, plus load, is a good measure with which to compare the horse and the motor truck. A ton mile is one ton carried one mile, just as five tons carried one mile is a five ton mile. The comparison shown in the U. S. Department of Agriculture's figures tell the story. We can refer you to full and comprehensive data on cost if you will call on us. Before approaching a truck dealer a thorough survey should be made to determine the present and prospective business moving in both directions throughout the year. Experts are available at the truck factory whose duty it is to co-operate with you and help you to get this information. They are trained to give information of this kind.

The capacity of the truck should be somewhat in excess of present needs. If the tonnage is available for full capacity loads, it is cheaper per ton mile to operate a four or five ton truck than a two ton truck. Study carefully the leading types of trucks and consider on trucks of proved merit.

In deciding on a truck be guided not solely by first cost, but secure figures on cost of operation and upkeep from operators of the various trucks, but be sure that they keep accurate costs and not imaginary ones. The truck of highest initial cost may be the cheapest in the end. Sufficient funds should be raised to pay cash for the trucks. It is the cheapest if it can be accomplished. If you are ever in doubt on what to do, or desire an information, we hope you will remember that we are entirely at your service.

Now in your business it is highly important that you very carefully take into consideration all of the factors which enter into the transportation of your product. What is the present tonnage, length of service and what prospects have you for obtaining new business in towns as far away as 60 to 75 miles? Is the business big enough in any direction to warrant you hauling a trailer like capacity to the truck? If your truck happens to be one of five ton capacity, it can pull a trailer of equal capacity, or even greater capacity, for the motor truck has a greater draw bar pulling capacity than has for carrying. So, also there is built into every good truck a reserve capacity or a margin of safety. Some operators mistake this reserve or margin and grossly overload their machines beyond all good principle.

I know of many two-ton trucks that are carrying five and seven ton loads. It is not common sense to do this for the springs and axle are not built for it nor is the engine powerful enough to get away with it. It was built for two tons. Then again, the state will not allowed such loads on narrow tires. They break the road surface.

YOU WILL find that these same things will hold good in your business if you give the trucks a fair chance and for the sake of your business I urge you to investigate. It is highly important that costs, fixed and variable, should be kept from the moment you shift to truck operation. Your transportation costs are just as important to you as are the costs of manufacturing your product. The subject of costs is a big matter to bring up right here and an explanation of them would consume a lot of time. Fixed costs go on all the time whether your truck is moving or standing in the garage.

(Continued on page 136)

MOST ECONOMICAL OF ECONOMY CABINETS

This ECONOMY CORKBOARD CABINET has created a sensation among the ICE CREAM MANUFACTURERS who have come to realize that superior insulation means money saved in ice consumption.

In addition to having superior insulation this cabinet has a tapered trough, conserving the ice and at the same time giving more insulation where the brine accumulates. This cabinet is equipped with cylinders, making it easy to replace a can of cream at any time.

Every MANUFACTURER owes it to himself to give this cabinet a thorough trial. Place your order now, increase your sales, by having your ice cream kept in the best condition with the least possible ice consumption, and INCREASE YOUR PROFITS.

This tapered cabinet has an average of 3" corkboard on the side and 4" on the bottom, lined on both sides by water-proofing paper. Equipped with 7/8" buffer board to protect bottom of cabinet, making a cabinet that is far superior to ordinary styles.

Tub Cabinets. This separate compartment is especially designed for rural trade, as one compartment alone can be used without being compelled to ice the entire cabinet. The tubs of the cabinets are especially treated to prevent leakage.

Dry Package Cabinets. Most efficient dispenser of Brick carton, dry bulk package, or Eskimo Pies. Each package goes to the customer in perfect condition, having had superior refrigeration in a container totally surrounded by ice, in a cabinet heavily insulated with cork.

An Automatically Refrigerated Ice Cream Plant

Automatic Refrigerating Control Used in Plant of Manchester Dairy Company

By H. N. PORTER*

COMMERCIAL progress is evidenced by the increased volume of business and profit, but intelligent management is more strongly emphasized by improvement in processes. All of these factors are in strong evidence in the business progress of the Manchester Dairy Company of South Manchester, Conn.

From a volume of 10,000 gallons of ice cream in 1917, when their first automatic refrigerating machine was installed, to a volume of 60,000 gallons in 1923 is substantial growth. Eighty per cent of the business is within a mile and a half of the plant.

In 1919 a new building was erected which provided for a capacity of 2,500 gallons of ice cream a day. Two hardening rooms having storage capacity of 1,500 gal-

Manchester Dairy Ice Cream Co., So. Manchester, Conn.

lons were provided. In addition to this an ice storage room, cream storage room and combination ice making and brine storage tank were arranged for. All of this service was handled by a refrigerating plant consisting of two units—one of eight tons and the other of four tons capacity, all under complete automatic control, regulated by a thermostat located in one of the hardening rooms. In 1922 the building was doubled in size, increasing its capacity to 100,000 gallons.

The feature of this new building was the careful attention to design so as to minimize the labor required to operate the plant. A site was selected on a side hill. The entrance to the rear of the building is at the second floor and at this point the ice storage room is located. About 100 feet to the rear of the creamery building is located the ice house, in which natural ice is stored during the winter. This ice is brought by gravity to the ice storage room from which supplies are taken as required for the packing of ice cream to be shipped out. The ice crusher is located on the same floor as the ice storage room and delivers crushed ice to the manufacturing and packing floor. The handling of the ice, therefore, from the ice storage room to the tubs is entirely by gravity.

The cream room is likewise located on the second floor and supplies are delivered to the second floor entrance.

The mixing tanks, of which there are two, both being glass-lined jacketed tanks, provided with propeller agi-

* With The Automatic Refrigerating Company, Hartford, Conn.

tation, are located in the floor directly above the freezer room. The mix is, therefore, taken from the cream storage room and made up in the glass-lined tank. The mix is usually made up the day previous to the time of freezing and is held in these jacketed tanks at the proper temperature by means of brine circulation through the jacket.

When ready to freeze, the mix is piped directly by gravity to the freezers.

The hardening rooms are located on the freezer floor. These are arranged with coil-pipe shelves and are held at 0 degree to -5 degrees.

Automatic Switchboard, Compressor, Gauges, Motor Control Valves and Thermostatic Expansion Valve.

After hardening, the tubs are iced on the first floor (ice and salt being brought from the floor above by gravity) and the loading of delivery trucks is handled from a platform at the hardening room floor level.

BUSINESS grew so rapidly that in 1922 the building was doubled in size, increasing its capacity to 100,000 gallons, and it was necessary to replace the automatic four-ton machine with a sixteen-ton machine of the same make. Co-incident with this, the latest design of automatic control was installed on the refrigerating equipment. At the same time two additional hardening rooms had to be provided for.

THE unique feature of this automatic control is the arrangement of control devices in such a way that individual temperature regulation is secured on each of the services. Each pair of hardening rooms is controlled individually, the brine temperature and cream and ice storage rooms are controlled from another circuit and provision is made for cutting in a brine cooler during the periods of heavy freezing duty. Thus there are four parallel circuits of ammonia expansion.

Each circuit is controlled by a thermostat located at the proper point. One pair of hardening rooms will serve as an example. The feed of liquid ammonia to this circuit is governed by a motor operated liquid stop valve actuated by a thermostat located in one of the two

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

THE FROST KING'S CHOICE AS
THE MOST UNIFORM
STABILIZER

"U. S. GEL"

UNITED STATES
GELATINE CO.
MILWAUKEE, WIS.

hardening rooms, the first room of each pair being provided with a three-valve bypass for final regulation of temperature. When the hardening room warms up to 0 degree the thermostat opens the motor operated liquid valve. The ammonia is expanded through a thermostatic expansion valve in series and on the coil side of the liquid stop valve. Ammonia is permitted to flow into these coils until the temperature is brought down to 2 degrees below zero, when the thermostat operates to shut off the liquid supply. This performance is duplicated on all four circuits.

The ammonia compressors, on the other hand, are controlled by a regulator which operates to maintain a suction pressure within five pounds of a given point at all times regardless of the condition of feed of ammonia into the coils. When the pressure in the suction line rises to 12 pounds gauge, the compressors are placed in operation. The compressors operate until the coil pressure is brought down to 5 pounds gauge, when the machines are shut off until the pressure builds up again.

This system provides absolutely individual control of the temperature of each of the services and back pressure control of the compressor insures most economical operation.

AUTOMATIC refrigeration of this type not only insures proper temperatures at all time, but virtually eliminates attention to the refrigerating machinery. The unique and careful design of this building, with respect to gravity handling of the product and the placing under automatic control of the refrigerating apparatus enables one freezer man to perform not only the freezing operation and the supervision of shipping, but the same individual also looks after the refrigerating equipment. No

engineer is employed and no attendance is provided after the dairy closes for the night. Temperatures are maintained day and night under automatic control and a large volume of brine is always ready at the proper temperature for freezing the next morning.

Fourteen electric motors, ranging from 1/2 H. P. to 30 H. P., are required to drive the various units of

Automatic Thermostatic Expansion Valves, Gauges and the latest type of Motor Control Valves. The latter are in the rectangular boxes.

equipment, but even with the capacity of 100,000 gallons yearly, the power cost averages only a little over \$2,000 a year. The use of electrical energy eliminates the necessity of engineers and fireman, and the well designed layout of the equipment permits handling a large quantity of ice cream with six men, whereas similar size plants with non-automatic refrigerating equipment and less convenient layout requires eighteen or more operators.

NEW ENGLAND ASSOCIATION TO HOLD SCORING CONTEST.

The May meeting of the New England Association of Ice Cream Manufacturers will be held at Springfield, Mass., and members of the association will accept the invitation of Professor Judkins to hold a scoring contest at the Massachusetts Agricultural College the day following the meeting. This was decided upon at the February meeting of the association. The association also decided that since members have not held an outing for some time, the secretary be instructed to write the Poland Springs hotels in Maine and find out costs, etc., and see if arrangements could be made to hold the September meeting there, with the idea of having an outing as well as a meeting in Maine.

The cost is little, the results are quick and satisfactory, "The Review" Want Ad way.

Do Your Hardening Rooms Keep in the Cold

DARTS FROM OUR FRIENDLY ENEMIES.

(Continued from page 8)

WE TAKE too much for granted. Sometimes the editors of this publication are prone to pass up a misunderstanding with the observation that, "Oh, well, folks know what we are doing here."

That makes us better appreciate the position of the newspapers that recently carried Dr. Evans' inaccurate charges. It is not that the newspaper people wish to misrepresent anything. The average newspaper man is pretty much the same sort of chap as all the rest of us, when you weigh him down to the heart's core. It would be asking a whole lot of him to expect him to be as familiar with every subject he discusses as are the men who have spent many, many years studying and working over the specific matters relating to each specific subject.

But it is bad business for us to follow the habit of taking anything for granted. Ice cream manufacturers of the country should not fail to register their protests and put the newspapers on the right track every time the industry is misrepresented in any way. For if a man who stands as high in his profession as does Dr. Evans is ignorant of conditions in the ice cream industry, surely the ordinary layman does not know better.

Close on the heels of Dr. Evans' article—and probably inspired by it—there appeared in the Chicago Tribune several disagreeable and alarming paragraphs regarding ice cream. These paragraphs appeared in a column conducted as a daily feature by Frank Ridgeway. Mr. Ridgeway, too, seemed to be unaware that pasteurization has been incorporated into the laws of most every state to safeguard ice cream against bacteria.

ELSEWHERE in this issue we are relating how manufacturers in different parts of the country are showing every evidence of interest in maintaining a high standard of quality in their industry. Of course, the proof is not required for people who closely follow the activities of associations of ice cream manufacturers. Ice cream associations in the few states that have a pasteurization law have for several years bent every effort toward getting such a law passed. In some instances it is because of lack of co-operation by health officials themselves that such a law has not been passed. It has been necessary for the ice cream manufacturers themselves to do much educational work among the health officials, the associations often going out of the way to get these officials to speak at their conventions and help discuss plans for keeping on a high plane the industry that holds such an important position in the lives of men, women and children.

If medical gentlemen who interest themselves in the affairs of dairy manufacturing would give to the ice cream industry the co-operation which the industry cordially invites, instead of injuring the industry by the advised criticism laid before the public, they would find that the ice cream manufacturers not only are struggling to keep their product safe and wholesome but are eager to give their support to any suggestion for protecting purity in ice cream production.

The average ice cream manufacturer is as good natured as the average layman, but it begins to wear on the nerves when so many people high in the medical profession insist upon discussing phases of dairy topics which they are unfamiliar, nearly always managing to take a slap at ice cream while so doing.

IN a recent issue of a publication called Health Facts we find an article entitled, "Ice Cream—A Gastronomic Graveyard," by Dr. Axel Emil Gibson of Los Angeles, Cal. This gentleman, who no doubt is widely regarded among his friends as an authority on the subject, tries to tell his readers why it is dangerous to eat too much ice cream.

It is noticeable that he writes entirely from his own views in the matter, never citing an example of a child or grownup who has suffered from eating "too much ice cream." Also, he does not take the trouble to tell the number of instances where children and grownups alike have built up rugged health from freely and consistently partaking of the frozen beverage.

COLORADO ASSOCIATION IN SESSION.

Members of the newly organized Colorado Association of Ice Cream Manufacturers were making arrangements to meet with the associations of creamerymen and creamery fieldmen of that state at Pueblo on March 13, as this issue of The Ice Cream Review was ready to go to press. The ice cream association's board of directors accepted the invitation to a joint convention issued by The Colorado Creamery Butter Manufacturers' Association and the Fieldmen's Association.

A tentative program announced March 13 provided for a meeting of the ice cream men's board of directors at the Vail Hotel, at 11 o'clock the morning of March 13, a luncheon at the hotel at noon, a special meeting at 2 o'clock, and a get-together banquet at 6:30, members of all associations participating.

Edward L. Carlson of Denver is secretary of the Colorado association.

PLAYING THE WEEK-END SPECIALS.

(Continued from page 14)

tain is to get the public interested. The newspaper the accepted medium. In this connection it must be stated that ice cream manufacturers cannot put together a few words and clauses about ice cream, food value, etc., for you will never hear a child say, "It's such a splendid food, daddy, buy me some ice cream." The food thought should be in the ad, but above everything else there must be that which will create the desire. This quality is commonly called the "appeal." A manufacturer began to advertise his chocolate ice cream. He told why it tasted so good and where the things that went to make it came from and just how they were blended. Then he took his strawberry ice cream and told them about that; he told the people just why it tasted so good.

The ice cream manufacturer had caught the right idea. A wide-awake fellow began featuring "week-end specials," advertising a certain special flavor on one specific day or days. Perhaps it might have been fig walnut ice cream. People were told how good fig walnut ice cream was; the dealer featured it. There was a great volume of sales on fig walnut ice cream that day.

IT IS thought that the week-end special will in time come to be the daily special. People will learn to eat at least one plate of ice cream every day. Perhaps there might be one big special each week-end, but window streamers showing chocolate, strawberry or some other standard flavor might be shown on other days just for the suggestion which they make to the minds of the people through exciting their sense of taste. For here truly in this picture form is the very best expression of the "taste appeal." To see the very things that go into the ice cream to make it so good makes people hungry and creates sales. Here is certainly the most effective use of the taste appeal and wide-awake manufacturers are using it more and more.

An idea of what to expect of the spread of the "week-end special" plan this year is gained from the announcement by one of the distributors of window flavor streamers, Ryan & Timberman, Inc., Wilkes-Barre, Pa., that this firm alone expects to distribute several million streamers in 1924, with thousands of orders already booked.

EVANGELISM OF QUALITY SWEEPS SOUTH.

(Continued from page 22)

The co-operative movement of Kentucky received a great impetus a few months ago with the organization of the Louisville Club of Ice Cream Manufacturers.

The North Carolina Ice Cream Manufacturers' Association for some time has been holding "revival" meetings to keep the association spirit flaming and to promote the quality idea.

The Georgia association meets four times a year to talk over better ice cream. Regional meetings also are held in Mississippi and Arkansas.

The Real Question.

Wife: "Do you know that you haven't kissed me for weeks?"

Prof. (who is absent minded): "Good heavens, who've I been kissing then?"—Wisconsin Octopus.

EVERY MANUFACTURER IN THE COUNTRY SHOULD BE A MEMBER OF THE NATIONAL ASSN. OF ICE CREAM MFRS.

Bigger Ice Cream Sales

Develop Volume Sales with Sealright Containers

There's more profit to you in volume sales!
There's more profit to you in steadier sales—
year-round sales!

By packaging your ice cream in Sealright Containers, you can develop volume sales, and steady sales. Because Sealright Liquid-Tight Paper Containers assure 100% leak-proof, drip-proof, crush-proof and complaint-proof "carry-home" service that appeals to customers, and helps dealers build up a regular trade.

All popular sizes from the 1/4 pint and 1/2 pint to the gallon size and One-Time-Use Paper Packing Tray. Can be filled direct from freezer or by Sealright Ice Cream Filling Machines. No special mix required. Write for samples and a copy of our free book "Selling Ice Cream the Sealright Way." This book tells the complete Sealright story.

South Dakota Manufacturers Meet

Large Attendance and Interesting Discussions Feature
Annual Convention at Watertown

THE fourth annual convention of the Ice Cream Manufacturers' Association of South Dakota was held at the Hotel Lincoln, Watertown, S. D., Feb. 19 and 20, 1924. An unusually large attendance and manifest interest served to culminate in one of the best meetings in the history of the organization.

The first number on the program was a talk by Prof. C. D. Dahle of the University of Minnesota. Professor Dahle has as a background considerable data on experimental work done by him at the dairy department of the University of Minnesota. He stated that defects in early times were virtually always present and were of many kinds. Due to experimentation and development of the industry it is possible today to make a uniformly high grade ice cream with but occasional defects in flavor and body. It is always advisable to avoid high flavor.

Most manufacturers today are against acidity or the use of starters. Development of viscosity in the ice cream mix is due primarily to the further solidification of fat and gelatine. It is also to some extent due to the swelling of colloids such as serum solids, skim milk powder, etc. Defects of body consist of graininess, soggyiness, and sandiness. The question of total solids was emphasized as being very important. Variations range from 30 to 40 per cent but the proper range should be from 34 to 38 per cent. Sandiness in ice cream is caused by too high serum solids. High serum solids content means generally high milk sugar percentage.

The presence of the high percentage of milk sugar causes sandiness which is the settling out in the ice cream of the lactose crystals. In the experiments conducted at the

University of Minnesota by Professor Dahle, any mix containing over 8½ per cent lactose produced sandiness. Avoid too much condensed milk or too much skim milk powder. Lactose is present in large quantities in these elements and there may not be water enough present in such mixes to hold the lactose in solution. Corn sirup, rennet, etc., which have been used to overcome sandiness, do not seem to have proved satisfactory.

THE convention of the ice cream manufacturers was continued Wednesday morning, February 20. R. F. Flint of the Bridgeman-Russell Co., Sioux Falls, discussed the subject of a charge for ice cream containers.

He stated that it was almost impossible to get dealers to hold any definite agreement concerning empty ice cream cans and tubs. His opinion was that there should be laws requiring the washing and return of these as well as milk bottles. Following Mr. Flint's discussion the convention was favored with an exceptionally good paper on "Ice Cream Engineering" by R. Schwart of the Ives Ice Cream Co. of Minneapolis.

The convention ended with a parent satisfaction to all. The members expressed themselves being highly pleased with the program and several invitations were extended from some of the better towns of the state to the association for next year's convention.

Water and Lactose Content as Factors in Developing Sandiness.

Fat	S. S.	Sugar	Gel.	T. S.	Water	Lact.
8	10.8	12	.5	31.3	68.7	5.84
14	10.8	15	.5	40.3	(59.7*)	(5.84)

(*Low water content caused sandiness.)

Time for Appearance of Sandiness.

Gel.	Hard. Room	Retail Cabinets
.5 %	10 days	5 days
1.0 %	21 days	10 days
2.0 %	26 days	10 days

Varying temperatures or heat shocking hasten the development of sandiness. A practical mix for S. D. requirements might have the following composition:

Fat	S. S.	Sugar	Gelatine
14	10	12	15

This has 8.5 per cent lactose concentration and will avoid sandiness.

A CORRECTION.

In the February issue of The Ice Cream Review published a report of the Indianapolis convention of the Indiana Manufacturers of Dairy Products. Our reporter, in discussing the work of the committee on standardization of pipe fittings, said that the "inside" diameter had been adopted as standard. He made several other erroneous statements in three short paragraphs.

We are reproducing that part of the report which should have read as follows:

The outside diameter has been adopted as standard and in order for users to assure that they are getting the standard fitting, they should specify "STANDARD FITTING" when ordering so that there will be no mistake. It is the general opinion that the sanitary fitting will be universally in use within the course of a very short time. The fitting will be placed on the market by all manufacturers not later than the first of May.

Those using inside diameter fittings will be able to install the standard fitting by means of adapters or in cases where more than one plant is operated, by diverting the inside diameter fittings from several plants to one or fewer plants until the complete turnover into the standard fitting has been accomplished.

One of the largest milk dealers and users of fittings has stated that in their numerous plants by following this plan that they believe they will be able to have the STANDARD FITTING in universal use in less than a year.

MECHANICAL CABINETS?

HAVE you decided to equip your customers with mechanical cabinets? Or are you contemplating this step? In either event, changes in your delivery equipment will be necessary.

The ABC Refrigerator Body is ready. ABC Wholesale Delivery Bodies have been designed and perfected especially to supply mechanical cabinet routes. Send for information and prices.

This latest design of the ABC Refrigerator Body has the same qualities by which all Anheuser-Busch-built ABC Refrigerators are distinguished:

Better construction and consequent longer life;

Remarkably low ice and salt consumption in the refrigerating system;

The very best metal lining, and most advanced water-proofing of roof and exterior;

Thorough insulation throughout, of the finest corkboard.

WHAT ABOUT EQUIPMENT FOR SPRING AND SUMMER—READ THE ADS.

America's Financial and Electrical Wizards—Henry Ford and Thomas Edison—snapped leaving Muscle Shoals together.

HITCHING THE SOUTH'S WILD HORSES TO INDUSTRIAL DEVELOPMENT.

(Continued from page 10)

agriculture, were prosperous. Wider range and additional pursuits are needed to awaken all dormant intellect and energy. God speed the day when...our Clay clubs and Democratic clubs will be turned into societies for the advancement of scientific agriculture and the promotion of mechanic arts."

Every other condition is favorable to the development of the ice cream industry in the South, except for the fact that the manufacture of ice cream, being a comparatively young industry, has allowed the soft drink and candy industries to claim for themselves much of the trade that ordinarily would be easier to attract to ice cream. Long seasons of warm weather are in the favor of the manufacturers in the South, as also a type of population that eats the most ice cream in other sections. Industries requiring skilled workmen will mean more earning-power for the white population, and although the negro is undeniably fond of ice cream, social conditions are such that it is not altogether profitable to reach the negro trade, as the class of stores open to negro patronage is not of the neat, sanitary type that the ice cream manufacturer likes as distributing places for his product. For this reason the building up of the white man's earning power will mean more than anything else to the ice cream industry.

The establishing of industries in the South in recent years has been regarded by many in the Northern states as a movement calculated to take industries from the North to the South, especially in the case of New England, which has steadily been losing textile mills to the advantageous section below the Ohio River. But the Muscle Shoals scheme will make it possible for the South to build up industries from within, without unduly bothering itself about manufactories successfully established elsewhere.

Muscle Shoals promises not only to put the South in better position for creating the industries it has struggled for for many years, but its development also would insure advancement for the industries already in operation. Streams of wealth would pour into the states affected by the project through the many additional advantages to be offered for industries in a section al-

ready greatly favored for industries, with high-type labor, inexpensive land, inexpensive building material, and without the hindrances of labor dictators. Add to these advantages power cheap and powerful, and an ideal condition is apparent.

The greatest thing to be said for Muscle Shoals' possibilities is the fact that Henry Ford, probably America's greatest financial wizard, has held on for a long time to his effort to acquire control of the Alabama project. Moneyed men are seldom interested in anything that does not promise great financial returns, and the Detroit manufacturer is not noted for wasting time with things that do not offer great returns.

MUSCLE Shoals is that stretch of the Tennessee River, 37 miles in length, where the river, running virtually in a straight course, spreads out in lac formation, though without the smooth surface characteristic of the lake. A vertical fall of 137 feet in the 37 miles creates throughout the length of the shoals a current so strong that the entire 37-mile stretch might be called the "rapids."

Along this whole course, except for many pools here and there, the river is only from two or three inches to two or three feet deep. Many so-called "tow-heads" are formed by the rocky bottom jutting out in places and in time gathering enough drift and soil in the midst of the rushing current to produce vegetation, ranging in size from a half dozen reeds that have fought for and succeeded in gaining a foothold, to small islets, some of which have attained the dignity of islands which justify cultivation, producing hundreds of bushels of the finest Indian corn with less cultivation than would be possible on any other than this rich alluvial soil. Muscle Shoals is situated between Lauderdale and Colbert counties, Ala., more than 200 miles above the mouth of the Tennessee River.

Within this 37 mile area is stored up force from which can be developed approximately 600,000 horsepower of energy. Controlling this energy will mean the broadest and most thorough kind of development of the states located in that territory, from the Carolinas to Mississippi, from Mobile on the Gulf to Tennessee and the adjoining region. Industrial development of

No. 9
"SAXMAYER"
Bundle Tyer
with Table
Base.

A Thoroughly Practical Tying Machine

Does Better Work—Saves Money

If you have never seen a "Saxmayer" Bundle Tyer at work you cannot imagine how much faster and better it will do the work of several hand tyers.

Fool Proof

No experienced operator is needed. Any boy or girl can learn in five minutes.

Automatic

No operation is required except passing the packages over the platform. The machine automatically does the rest and ties packages of various sizes without special adjustment.

Saves Twine

Every knot is firm, neat and uniform, and there is no waste string—a big saving in itself.

Runs Electrically

You can attach to any light switch. The machine is easily moved from place to place. Either floor or table base.

The minute you put a "Saxmayer" at work you can count on saving the wages of one or

more persons, according to the amount of tying you have to do.

As anybody can operate it on a moment's notice, your worries in the tying department are over as soon as a "Saxmayer" is installed.

Ten Days' Free Trial

We feel that the best way to judge the merits of the "Saxmayer" for your individual work is a trial in your own plant, and we will gladly ship you a machine for 10 days' trial without obligation.

Write us to send it on.

A "SAXMAYER" at work
in the Lawrence Ice Cream
Co., Chicago, Ill.

The National Bundle Tyer Co., BLISSFIELD MICHIGAN

most intensive kind is sure to follow the harnessing of this hydro-electric energy.

The government has already spent \$40,000,000 on the erection of Wilson Dam, which extends nearly one mile. Dam No. 3 was built at a cost of \$8,000,000. Three locks were erected by the government in connection with these dams at a cost of \$15,000,000. The Detroit manufacturer, of course, proposes to reimburse the government for these expenditures, in addition to paying a yearly "rental" of \$1,680,000 as interest on capital invested.

When completed, Dam Number Two will back water up the river sixteen miles to the proposed location of Dam Number Three. Owing to the fact that there is much less fall to the river above this point, there will be no comparison in the size of the lake it will form to the one formed by Dam Number Two, for Dam Number Three will back the water up the river about seventy miles, and the obstructions to navigation made by the Shoals will pass into history forever.

In addition to navigation in the river, the formation of this lake will add a total of sixty miles of navigation to its tributaries, adding to navigation in all a virgin navigable water line of more than four hundred miles in extent, making it and its contiguous territory accessible from the sea. Take the sea shore to the mountains, creating an inland lake whose every foot of shore would make a health resort, on whose banks, boulevards, residences and factories would spring up like magic, with both power and transportation at their doors, making possible Ford's great plan of "the factory carried to the country."

It is proposed to provide for the manufacture of fertilizer and its sale to farmers at approximately 8 per

cent above the actual cost of production, the furnishing at cost of production of 100,000 horse-power for the manufacture of fertilizer, and the furnishing of power for the operation of the locks and navigational facilities.

IT WOULD be difficult fully to visualize what the utilization of Muscle Shoals really means to the South. The Tennessee Valley has been likened by some writers to the Rhine territory, and the power of Muscle Shoals has been compared to Niagara.

It is a section rich in agricultural possibilities in raw materials, which include timber, coal, limestone, copper, iron ore, bauxite, brick clays, slate, and virtually every essential factor necessary to industry. This is to say nothing of the fact that textile plants in this territory would have cotton galore at their very threshold.

The French Broad River is one of the most beautiful streams in the world. It pours out of the mountains of North Carolina and is joined about four miles above the city of Knoxville, Tenn., by the Tennessee River. Many other streams join the Tennessee before it reaches Muscle Shoals. Leaving Knoxville, the Tennessee River flows in a southwesterly direction through the southern portion of Tennessee to Chattanooga. After forming the Moccasin bend at this point, it winds about the foot of historic Lookout Mountain and enters the state of Alabama. Turning westward, it cuts across the entire northern extremity of Alabama, virtually one county deep, leaving the counties of Jackson, Madison, Limestone and Lauderdale, on its northern bank, thence back into the state of Tennessee, this time picking out a northerly direction across the entire state and a portion of the state of Kentucky, emptying into the Ohio River at Paducah.

The Muscle Shoals proposition is one of the great assets of a section that fairly bristles with wonderfully undeveloped resources. It was unfortunate that the South, in its early settling, had to be built up as a great cotton-growing country, with the order of things worked out so the South would produce the cotton and allow New England to manufacture it. When conditions in the cotton fields were revolutionized many years ago, it was found that in the new order of things industries were highly necessary. To get the industries under way in the South is a condition that the Southern states have been fighting very hard to bring about in the last several years. The development of Muscle Shoals will mean more industries for the South, and those industries in turn will mean opening the way for the development of the great mineral resources of that section.

IN SPEAKING of latent assets we shall turn our attention to what the South is doing for dairying. Dairying is being urged upon every hand. That many civic and agricultural leaders are working earnestly to convert the South's thousands and thousands of acres of pasture land into grazing land for purebred

AMONG THE BRIGHTEST THINGS IN THE REVIEW ARE THE ADS—READ THEM.

dairy cattle. It will be recalled that early in this discussion it was mentioned that the Southern Association of Ice Cream Manufacturers decided at its past convention that it was a separate organization from dairying and therefore would take no part in the development of dairying except insofar as its members could offer encouragement.

In the mountains of the South, which have been referred to many times as America's greatest undeveloped asset, are vast areas of undeveloped land, much of it natural pasture land, with grass growing for the greater part of the year. In these mountains—many of them eking out a bare existence from the unprofitable growing of cotton—are men of the finest strain of this nation's pioneering blood.

Many men of the mountains have climbed over their obstacles and achieved success in all cities of the country, in all walks of life. Some of them have become the heads of America's greatest industrial and financial organizations. They have fought with credit on every American battlefield; won fame in every court of justice; attained high ranking in every profession; have made valuable contributions to every art.

In the mountains of the Southern states still flows the blood of Washington, Lincoln, Andrew Jackson, Patrick Henry, Lee, Jefferson and many other heroes of history. In those mountains are men with mighty minds—men of a sound aristocracy of character—who are waiting for developing forces that will help make them stronger factors in the nation's upbuilding.

Every day these men carry on labor sufficient to build an empire. Right at their elbows, so to speak, are valuable assets for a gigantic system of dairying that would bring about the greatest economic stability

for the Southern states and the advancement of human living conditions.

There is no minimizing the South's wonderful mineral assets, but it is interesting to see what dairying can do for people who take it up earnestly.

In 1921, dairy production in Wisconsin, the world's greatest dairy state, far overshadowed the mineral production of the entire country for that year. All the gold mined in the United States in 1921 was not enough to pay for the cheese Wisconsin produced that year. All that gold fell \$10,000,000 short of equalling the value of the butter made in Wisconsin that year. All the gold and silver mined in the country in 1921 could not have paid Wisconsin dairymen for their butter and cheese. Wisconsin's dairy production that year was worth much more than twice as much as all the iron ore mined in the country. The value of all of Wisconsin's dairy products—butter, cheese, ice cream and condensed milk—was greater in 1921 than the nation's entire output of iron ore, copper and gold.

And the greatest thing about dairy development for the South would be the upbuilding of farm prosperity, the bettering of conditions among the farmers of the mountains and lowland.

The South is moving in many directions for the development of its latent resources, and in addition to the harnessing of its vast water-power and the uncovering of its mineral deposits, it will be very interesting to see what these different forms of development shall do for dairying and the development of the real power that lies dormant in the mountains—the mountain people, truly America's greatest undeveloped asset.

LARGE ICE CREAM PLANT IN NORTHWEST.

A. Robbins, formerly of Winnipeg, has selected Tacoma, Washington, for the establishing of a large ice cream manufacturing plant. This decision was reached, Mr. Robbins says, after a careful survey of business opportunities in Pacific Coast cities. In association with prominent business men, Mr. Robbins has completed negotiations for the reorganization of the Victory Ice Cream Co., and announcement has been made of the erection of a quarter million dollar ice cream plant. The completion of this plant will make Tacoma the large distributing point for ice cream in west-central part of Washington.

The Victory Ice Cream Company's building is now under the course of construction at 615-617-619 East 25th Street and according to reports, the plant will be modern and the most sanitary type of equipment will be installed, making this one of the most complete and up-to-date ice cream manufactories in the Northwest. The plant will occupy three full floors, each 80x136 feet in dimension.

Officials advise that a product of unequalled merit will be manufactured, and that quality will be first consideration.

Among the features of the new establishment will be new silver-lined ice cream freezers, modern sharp roof space of 14,000 gallons of ice cream with glass-lined storage vats and walls of 10-inch pressed cork and tile, automatic electric ice cream cutter, new modern packing machines which will eliminate the touching of the finished product by hand, electric washing and sterilizing machines for equipment, thus assuring the strictest sanitation.

AN ENGLISH VIEW OF OUR MILK INDUSTRY.

by W. R. McEwen, Advertising Manager, J. G. Cherry Company, Cedar Rapids, Iowa.

Very often it is the outside viewpoint that gives us the true perspective of our business. We become so deeped in the details we do not have the wider vision afforded the man who sees our problems from the "side-ness."

There is pretty good evidence of that fact in a recent article by J. Gillard Stapleton appearing in an English trade paper devoted to the interests of the dairy industry in England. Some of the points made by Mr. Stapleton are well worth the serious consideration of the milk trade here in the states. One in particular he brings out is the matter of "cream line." He writes on the subject as follows:

"On examination, it appears that one of the chief reasons for low temperature pasteurization in America is the competition of distributing firms to obtain a big cream line. This competition for a deep cream line appears to the writer to be based on wrong principles. The calf certainly cannot wait for a cream line when it takes its milk in its natural state from its parent, and the existence of a layer of cream when delivered to the consumer provides the consuming public with an easy means of robbing the milk of part of its cream, and as this is illegal for the distributors to remove cream from the milk it logically follows that indefinite robbing of the milk of its cream, by the public, should if possible be prevented, and certainly the public should not be encouraged to do so."

As Mr. Stapleton writes, it is a simple matter to pasteurize at a temperature that will insure a deep cream line. Distributors in all parts of the country are doing so, and with good reason, for the housewife, in nine cases out of ten, bases her opinion of the richness of the milk she buys on the depth of the cream line. Every distributor knows this "measurement" of the value of milk is erroneous, but the public has been educated to look upon a deep cream line as the measure of its richness, so he strives to make his a deeper one than that of his competitor, and his driver salesmen are urged to talk this feature to their trade. It was a mistake in the beginning but has grown to the point now where it will require herculean efforts to swing public opinion back to the normal way of "measuring" the value of the milk they purchase. But is it too late to make the change?

Won't it be advisable, even at this date, to begin educating the public to the right way of determining the value of milk? The work the National Dairy Council is doing can be and should be adopted as the basis for switching the public thought on this subject—in the writers' opinion.

The competition for the deeper cream line is going to lead to a situation, as regards proper pasteurization, that will ultimately develop to the point where city health authorities will insist on different control methods and the result will be publicity that is certain to do an endless amount of harm as regards the consumption of whole milk—for the public will lose confidence and much of the good work already accomplished by the National Dairy Council will have been wasted.

It seems to us this is a subject that is worthy the serious consideration of the International Association of Milk Dealers and should be put on their program for discussion at the next meeting of the organization and for their consideration, by correspondence, among their members, before the next convention.—Editorial April Cherry Circle.

A Plant That Attracts the Public

Officials Have Put The Human Touch Into the \$1,000,000 New Home of the Globe Ice Cream Co. at Los Angeles

THE value of the "human touch" is being appreciated in the ice cream industry as the industry advances. Leading ice cream manufacturers for some time have understood the importance of making the public feel in close touch with the ice cream plant.

Every night during the opening week the plant was ablaze with colored lights. Special arrangements made it possible for the plant to be illuminated every evening. The interior is done in cream white, as Mr. Comey has erected a huge battery of colored lights in each room

Modern Plant of Globe Ice Cream Co.

*Of course they are not the
cheapest—they are the Best*

CREMOS cost more than ordinary cones. WHY? Because beyond question they are the finest cones made. The best soft wheat flour, and cane sugar, the purest milk and vanilla maintain the superlative quality of Cremos. Only our tremendous production keeps the price so reasonable. The extra quality costs a trifle more—1% of the retailers selling price and is worth it many times over. The proof of that is the fact that more Cremo Cones are bought each year than any other cone.

New Boston Headquarters

*for Nationally Known
Ice Cream Equipment
and Supplies*

January 1, 1924, inaugurated the opening of a new Boston supply house—the STEPHENS-ADAMS-CYR COMPANY, composed of the Frank B. Cyr Co. of Malden, Mass., with Willis C. Stephens and Orlando Adams, both of the Rice and Adams Corporation of Buffalo, N. Y.

Their office and warehouse are temporarily located in Malden, Mass., the office address being 52 High Street.

A new combined office, show room and warehouse is being erected in Charlestown and will be ready for occupancy about July 1.

Direct representation, and prompt and efficient service are given on

J. G. Cherry Ice Cream Freezers and Coil Machines;

Rice and Adams Washing and Sterilizing Machines for Ice Cream Cans, Covers and Moulds;

Rice and Adams Milk Can Washing, Sterilizing and Drying Machines;

Elyria Enameled Products Company Glass Lined Storage Tanks;

Viscolizers, ice cream cans, coolers, tubs, cabinets, trucks and copper jacketed kettles.

Stephens-Adams-Cyr Company

52 HIGH STREET
MALDEN, MASSACHUSETTS

window space, thereby guaranteeing a daylight factory.

The plant is considered by visitors to be one of the finest, most modern, most sanitary, and most immaculate factories now operating in the United States. Sixteen large refrigerator trucks are at the present time operating in the delivery department; one hundred employees are on the payroll. The garage is most modern. Approximately 400 customers are being served in the city of Los Angeles. Beautiful gardens decorate the front entrance, and the process of manufacture is on display to the public as they walk along the sidewalk, or drive by in their automobiles, and this idea alone has proved very

Department for weighing and inspecting sweet cream.

valuable advertising. From early evening until midnight the entire plant throughout is illuminated in gorgeous colors, these colors being changed every week, and the least that can be said about the Globe plant, day or night, is, it is really spectacular.

"Hundreds of manufacturers from all over the United States have visited this plant, and they have all proclaimed it to be a wonderful institution." A gentleman who has inspected the plant reports to The Ice Cream Review: "To be honest, words cannot explain the elegance of Southern California's new Globe ice cream plant. Thousands of visitors monthly make trips through this institution. At the front entrance signs are on display inviting the public to visit the Globe plant."

"Will E. Keller and A. A. Comey are to be congratulated indeed for erecting such an elaborate and high class institution, and in all probability plants in other cities throughout the United States will be similarly built or erected."

You'll make better ice cream if you get "The Ice Cream Review."

WORD FROM ADOLPH SKINNER.

Winejah Sanatorium,
Asheville, N. Car.

ixie Flyers:—I want to thank you for those nice
s you have been so kind to write me, and it would
given me great pleasure to have been with you at
ittle Rock convention.

veral of the boys have been to see me, and it sure
lots of pep into a person who is laid up for repairs,
trust that they will keep it up.

always look forward to receiving The Ice Cream
w, as it tells me all the news, and what is going
over the country.

Yours very truly,

ADOLPH SKINNER.

SPECIAL ANNOUNCEMENT OF MILWAUKEE'S SECTION FOR 1924 NATIONAL DAIRY SHOW.

Executive Committee of the National Dairy As-
sion announces that the 1924 National Dairy Expo-
will be held at Milwaukee, Wisconsin. The dates
September 27 to October 4.

Wisconsin will be host to the people of the industry
has made her great and will prepare a week for
ing that will mark an epoch of progress. It is the
ion of the people of Wisconsin to dedicate a period
all to a thorough and complete study of the dairy
ry through exhibit and forum, and through the
ing together of the dairy people of the nation,
view of rendering a great national service for the
ry.

State Fair Grounds and the city Auditorium in
ukee afford the facilities for a program that will
ried out by the leaders of dairy agriculture from
state. The city of Milwaukee has reserved its
otel capacity, which means that from September
to October 4th every hotel is obligated to house
airymen of the nation. The city affords an un-
ed hotel service, from the Ritz quality to the most
nical, and a plan is being devised to insure a dis-
ion of the service so that each visitor may secure
ommodation he desires.

ICE CREAM INDUSTRY LEADS IN EMPLOYMENT.

Ice cream and confectionery industries lead the
ries of the country in increased employment for
onth of October, 1923, according to statistics com-
by the U. S. Department of Labor through the
of Labor, concerning volume of employment
h the month of October. These statistics were
ed of 7,233 representative establishments in fifty-
manufacturing industries, covering 2,434,247 em-
s, whose total earnings in one week in October
65,731,632.

Replies to Inquiries

Dear Sir:—Please tell me what formula in your "Ice Cream Mix" I can use to produce a 20 per cent butterfat finished product ice cream.

Reply: There is no formula in this booklet for a 20 per cent fat cream.

I would suggest, however, that you use one of the formulas which appears to be suitable, and re-arrange the amount of cream to milk used so that the butterfat content will be increased, or I shall be very glad to work over any one of these formulas for a 20 per cent butterfat if you will indicate which one of these formulas will suit the ingredients your customer has in mind.

Dear Sir:—I would like to know what kind of pasteurizer batch mixer and cooler, and kind and style of ice cream freezers would you use for factory of capacity of 1,000 gallons per day? Is the viscolizer a success? Can you make first class ice cream from sweet butter instead of cream?

Reply: In a general way, I might suggest to you that the ordinary batch pasteurizing vats containing the coil

is probably the best suited for pasteurizing the ice cream ingredients. The ordinary horizontal cooling coil or a correct size Chilly King cooler would possibly serve the purpose of cooling better than any other method. The so-called baked glass enamel batch mixers and storage vats are superior to the ordinary copper tin vats for the mixing and storage of ice cream mix. They will not only last longer, but are also better from the standpoint of keeping them in good sanitary condition.

The type of freezer I would select would be the horizontal type batch freezer. You probably need three or four freezers to freeze a thousand gallons per day. Relative to the viscolizer this machine or a homogenizer would be indispensable in a plant the size you mention.

It is perfectly possible to make a first class ice cream using a reconstructed mix made from butter and with the use of milk powder, providing, of course, that your sweet milk is of good quality, not having any bad flavor and that your ice cream powder is fresh, sweet and entirely soluble having no rancid flavor.

Dear Sir:—We are giving below the mix we were using during the summer:

- 15 lbs. skim powder.
- 54 lbs. sweet condensed. (44% sugar, 27% S. S.; total 71% solids.)
- 57 lbs. sugar.
- 3 lbs. gelatine (seems to be very strong.)
- 11¼ lbs. egg powder (added before pasteurizing). (9 per cent solids.)
- 2¼ lbs. Impruv-Mix.
- 63 lbs. butter. (84% fat.)
- 406 lbs. milk. (4% fat.)

601½

The mixes were made part of the year by new men who, we think, may have made mistakes in weighing but we are not sure. Part of the ice cream rolled badly while other made from the same formula showed little of it. Our gelatine is an imported product. In case the cream is permitted to melt the effect of the gelatine is quite noticeable at the bottom of the dish.

Part of the summer we used some honey in place of a small part of the sugar, it also was added to the mix before pasteurization.

For this next summer we expect to use the following mix:

- 7 lbs. sweet condensed.
- 2¼ lbs. skim milk powder.
- 10 lbs. sugar.
- .4 lbs. gelatine.
- .5 lbs. egg powder.
- 80 lbs. of 14½% cream.

Going over the mix very carefully, I am absolutely of the opinion that too much stabilizer and improver was

BAKER

System Refrigeration

Are you still using ice and salt in manufacturing ice cream? If so we can show you how a Baker System Refrigeration will do the work more effectively at a fraction of the cost. Besides, with a Baker you can make your packing ice cheaper than it can be bought.

Personal Survey of Your Plant

Baker System Refrigeration is built to order—"tailor-made" to your individual conditions. No order is accepted until one of our refrigerating engineers has made a personal survey of your needs. This guarantees to you an efficient plant which should pay for itself in a very short time.

One southern ice cream manufacturer said he could buy a Baker plant every 16 months out of the savings made over the ice and salt method.

Get Your Copy Bulletin 65D It's chock full of useful information you will value. It explains the Baker System Refrigeration in detail and gives you the reason why over 5,000 Baker plants are in successful operation.

Baker Ice Machine Co.

Prompt Deliveries of Baird Refrigerator Bodies

IF YOU need a refrigerator body *in a hurry* telephone or telegraph us. We can ship a body in the lead within six days after receipt of order, and unusually favorable circumstances assure us of excellent deliveries by the Railroads.

AND REMEMBER that BAIRD REFRIGERATOR BODIES are light in weight, that they maintain three degrees below zero, and that every piece of wood and insulation is thoroughly waterproofed so that they always remain light, the insulation is always 100% efficient, and decay cannot take place.

THE SEAMS in BAIRD BODIES are welded and re-galvanized after welding. By welding, the two pieces of metal are fused together and actually become one piece, permanently resisting vibration and preventing leaks. Other 1924 improvements are thicker sheet metal, amply supported with angle irons, regular refrigerator door fasteners, stronger hardware, and lighter and better hatch covers.

BAIRD REFRIGERATOR BODIES were always the best, and are now better than ever.

William F. Baird Company

OFFICE: 401 Chamber of Commerce, BOSTON, MASS.

FACTORY: WINCHESTER, MASS.

the cause of your trouble. It is possible that your gelatine was stronger than you supposed it to be and the amount of gelatine you used along with the apparently large amount of your improver was the entire cause of your trouble. I am sure that the mix which you contemplate using next season, and as indicated in your letter, will not only give you a very satisfactory product, but will also prevent the "rolling" of your cream when dipped at the fountain.

Relative to the use of honey, I do not see where you would profit by its use, since there is plenty of good cane sugar available. I know of a number of factories, however, who are using honey in the making of special ices and sherbets, and appear to like it better than sherbets made entirely with sugar.

There is no advantage in using salt in an ice cream mix, although a good many of the older school of ice cream makers are using just a small amount of salt in the mix, claiming that it assists in bringing out the flavor. We have no experimental work, however, showing that salt does do that and I would personally not recommend the use of any salt.

* * *

Dear Sir:—We want you to criticise this mixture and offer suggestions:

410 lbs. water.

138 lbs Butter (82 % Fat content)

42 lbs Skim Milk Powder.

106 lbs Cane Sugar.

5 lbs. Gelatin (Swifts AA Grade)

120 lbs. Evaporated Milk (Mansfield's Milk of Johnson Creek, Wis.)

We pasteurize the water, butter and skim milk powder together and run through De Lavel emulsor at 140

degrees temperature after standing for thirty minutes at this temperature in mixing vat. When cooled to 50 degrees we add sugar, gelatine, vanilla and Heller's Meloine. Then cool to 40 degrees and let stand for 18 hours before freezing. We use a 40 quart Cherry freezer, horizontal type, and have brine 6 degrees in freezer. Before we freeze we cool to 34 degrees in mixing vat.

Our ice cream does not seem to be smooth enough or creamy. How much ice cream should such a mixture make? What can be done to make a better ice cream from this mix?

* * *

Reply: You will find the calculations of your formula given below in table one where you will notice it figures out 15 per cent butterfat instead of 12 per cent.

Table One.

Ingredients	Fat	Serum Sol.	Total Sol.
410.0 lbs. water
138.0 lbs. butter, 84 %	115.9	115.9
42.0 lbs. skim powder	39.9	39.9
106.0 lbs. sugar	100.7
5.0 lbs. gelatine	4.7
120.0 lbs. evaporated milk	9.6	21.6	31.2
821.0 lbs.	125.5	61.5	292.4
Per cent	15.3	7.5	35.6
Per cent sugar	12.9

I am suggesting in table two a formula which contains a higher per cent of serum solids in order to balance the ingredients properly.

Table Two.

800 lbs. Mix—12% Fat, 9% Serum Solids—13% Sugar.			
Ingredients	Fat	Serum Sol.	Total Sol.
160.0 lbs. evaporated milk	12.8	28.8	41.6
104.0 lbs. sugar	98.9
5.0 lbs. gelatine	4.7
99.0 lbs. 84% butter	83.2	83.2
46.0 lbs. skim powder	43.7	43.7
386.0 lbs. water
800.0 lbs.	96.0	72.5	272.1
Per cent	12.0	9.0	34.0

I am also sending you a copy of our mixing and freezing room report showing the figures on this report.

You also inquired relative to the use of an emulsor as compared with a viscolizer. While the emulsor can be used to get a satisfactory product from butter, powder and water, the viscolizer or homogenizer will reconstruct these products much better and make a smoother ice cream.

I notice that in your description of the method of processing you add the sugar and gelatine after emulsifying. It would be better if you could emulsify all the ingredients including the sugar and gelatine. You will in that way get a much smoother ice cream than when you add these products after emulsifying and cooling. You would do the same if you used the viscolizer instead of an emulsor. After processing, your mix should be cooled to about 40 degrees and kept at that temperature at least twenty-four hours before freezing. Eighteen hours aging is hardly long enough to get a good smooth product.

Leffel^{Scotch} Marine Boilers

THESE Self-Contained, Internally Fired, Horizontal Return Tubular, Portable Boilers are quick, steady steamers designed especially to meet the demands for intermittent steam power in the Ice Cream, Creamery and Dairy industries.

They come complete with skids and all necessary fittings, occupy less space and are more powerful than other boilers of the same sizes. Minimum time and labor are required to operate them. Users report average fuel savings of 35 to 50 per cent. Made in 12 sizes, 6 to 100 H.P. Meet requirements of all State boiler laws.

The O. & B. Triangular Packer serves as a container both in the shipping tub and in the cabinet. This saves much can-washing, re-icing and retinning of the containers.

Increase Your Sales

With the O. & B. Triangular Packer

In the diagram below, "A" indicates the direct contact of each Sealright container with the sides of the packer. "B" shows the cold air spaces between the containers.

This arrangement gives perfect refrigeration. It insures the cream reaching the user's hands in perfect condition.

The tub and cabinet illustrations show clearly the ample icing space surrounding the packer.

Each Triangular Packer holds 18 quarts, or combinations of quarts, pints, and half pints.

THERE is no question that *bulk ice cream* packed by the factory in air-tight packages that are also thoroughly cold will solve your problem of selling *the home trade*.

Successful factories everywhere are educating their trade to the use of fibre containers.

Users are *instantly served* and need not wait for cream to be packed by the dealer.

There is *no loss of cream* to dealer.

User *prefers* bulk ice cream, and that is what the dealer may now sell him *in the fibre package*.

When packed in O. & B. Triangular Containers, cream in fibre packages keeps *perfectly hard* even after user has them in his home.

The net result of the above is *more home sales*; and that, Mr. Ice Cream Manufacturer, is *important to you*.

Better order a sample dozen Triangular Containers *today*.

Pacific Ice Cream Manufacturers' Convention Proceedings

Important Trade Topics Discussed at Vancouver, B. C., Meeting

(Continued from March issue)

Holdom Discusses Packages.

"Packaged Ice Cream" was a subject exceptionally well handled by Gray D. Holdom, sales manager of Menasha Printing & Carton Company. Here are some of the facts and views as stated by Mr. Holdom: "There are a number of fundamental reasons why packaged goods have been so successful and these reasons are as applicable to ice cream as to any other product. First, and foremost, the package establishes the identity of a product that cannot otherwise be marked or labelled and should be used for this purpose in the advertising of the product. Second, the improved sanitary conditions under which the product may be handled between the manufacturer and the ultimate consumer. Third, better distribution methods and quicker turnover can be had through the use of advertised packaged goods.

"Adoption of the dry pack method of distribution is, to my mind, the solution of the problem now being experienced by many ice cream manufacturers. We used to buy flour from a barrel and other products in the same way, but packaged foods today are found in most every country. Nationally manufactured food products are leading the sales throughout the country and manufacturers of ice cream who want to get greater distribution must have another method of selling their product other than in bulk.

"According to information I have obtained there were between 210 and 225 million gallons of ice cream produced in 1923. Ice cream men have built this distribution through dealers and there will be no further growth unless per capita consumption can be increased.

"It is only in recent years that selling has been given much attention by the ice cream industry as the technical side had received much greater attention.

"The average weight of a quart of bulk ice cream dipped will be about 26 to 27 ounces. I have known of this weight running up as high as 31 ounces. The average weight of a quart ice cream is approximately 18 to 19 ounces, and these figures are based on approximately 100 per cent

overrun. This difference in weight is due to two things, difference in an exact measured quart as against an over measure in the case of a dipped quart, and second, but greatest in importance, I believe, that fact that an additional shrinkage is made in dipping through the loss of incorporated air content. The difference in texture in brick and bulk cream at times is very noticeable and can be accounted for in the difference in handling both in the factory and retail store. The difference in flavor is unquestionably due to, first, loss of flavor through hardening in small units, in the case of brick cream, and the heightening of flavor in the case of bulk ice cream through the lessening of incorporated air content in dipping.

"The price differential between bulk and packaged or brick ice cream averages about 25 cents and the retailer favors the packaged product. There is also a difference in weight of bulk and brick of about 20 per cent.

"It took over twenty years to put over packaged butter but you know what it is today. The cheaper methods of handling packaged goods by the new equipment that is on the market means that eventually ice cream will be delivered to the consumer in package form, which the average buyer prefers to the bulk method."

Committees Appointed.

Nominating committee:—Geo. W. Weatherly, chairman, F. N. Martin, Sam Stray.

Resolutions committee:—S. J. Simonson, chairman, L. M. Powers and Guy Herrick.

Auditing committee:—E. A. Burt, George Exley and P. M. Gregory.

At the business session held Wednesday morning, December 5, the following new members were accepted:

Highland Dairy, Mt. Vernon, Wash.

Valley Dairy, Sedro Wooley, Wash.

Penticton Ice & Storage Co., Penticton, B. C.

Olympia Creamery Co., Olympia, Wash.

Yakima City Creamery, Yakima, Wash.

Hood River Apple Vinegar Co., Hood River, Oregon.

"GMC trucks are seven steps ahead"

Opens New Markets—Increases Profits

The reliability of GMC trucks, their ability to travel roads impassable to other trucks and their high speed on good roads enable GMC owners to enlarge the range of profitable delivery and the economy of GMC operation leaves a materially larger proportion of earnings for profit.

GMC trucks embody seven special features of construction that definitely set them seven steps ahead in the motor truck world. Surplus power is provided without increasing the size of the engine, without sacrificing road speed and without adding in any way to running expense. Low maintenance cost and uninterrupted service are assured and indefinitely long life is possible because of exclusive GMC improvements. Constant brake adjustment, perfect cooling and unusually efficient lubrication are maintained by other special GMC features. In many essential points GMC is different and every change from the ordinary principles either materially increases the earning power of the truck or reduces the cost of its operation and upkeep.

GMC construction—GMC special features and what they mean to you in actual hauling advantage are fully explained in the free GMC catalogue. Actual photographs illustrate each feature—models are shown and specifications given. We have a copy ready to send you. Let us have your address and we will send it at once. Use the coupon below.

* * *

A meeting of the new board of directors followed the business session, when the following officers were elected:

W. V. S. Robb, president.
Geo. W. Weatherly, 1st vice-president.
D. M. Dorman, 2nd vice-president.
Guy L. Herrick, 3rd vice-president.
Bert H. Walker, secretary and treasurer.
Jay H. Kugler, field secretary.

* * *

A reclassification of dues was made, as follows:

10,000 gallons or under yearly,	\$7.50
10,000 gallons to 50,000 yearly,	15.00
50,000 gallons to 100,000 yearly,	20.00
100,000 gallons to 200,000 yearly,	30.00
200,000 gallons to 300,000 yearly,	40.00
300,000 gallons or over yearly,	50.00

F. N. Martin, Geo. W. Weatherly and Bert Walker were appointed as a committee to devise ways and means of assisting British Columbia members to oppose the four and one-half per cent tax on ice cream in Canada.

Final Session Wednesday Afternoon.

"Your Plant and its Possibilities" was the subject of William Dreyer of the Acme Ice Cream Co., San Francisco, which he handled in a very thorough and helpful manner. Many new features in efficiently operating the plant were brought out by Mr. Dreyer, as well as charts, which will be published in detail in coming issue.

* * *

Paul Heath in his address on The Mix and Result Desired went into his subject in an exhaustive manner which cannot be quoted in this issue, but will be published in full.

* * *

"Plant Administration and Uniform Cost Accounting" by E. A. Burt of the Weatherly Ice Cream Co. Portland. Quoting Mr. Burt, "Your profit is added to the gross price to get your selling price. This is the most important part of getting at your correct selling price.

"Losses sustained at the end of the year can generally be directed to the overlapping of routes, loss through excessive use of ice, salt flavor and other products, which must be taken into strict account if you don't want them to appear in the profit and loss column at the end of the year.

"Control of supplies is vital to profit. We place all of our supplies in a stock room under lock and key and they are issued only on signed requisition.

"Each truck that leaves our plant is charged with the number of gallons of cream, the salt and ice carried and on return of the driver this is checked and recorded on a report sheet kept entirely for that purpose. We also check our hardening rooms daily, keeping a record of cream going in and out. When every employee knows he is being checked up he is more careful.

"The cost of delivery is the biggest item in our business. A truck generally goes out with a full load of cream, salt and ice. It generally comes back with most of the ice cream but none of the salt and ice. By doing away with frequent deliveries to the same dealer and educating him to obtain his required amount at one specified time in the day, causing no inconvenience to him in his place of business and saving us a double delivery cost, another material saving can be effected.

You Know You Are RIGHT When You Invest In GRAND RAPIDS ICE CREAM CABINETS

YOU pay for just one thing when you buy ice cream storage equipment—and that is SERVICE.

Absolute assurance of **medium service**—many years of efficient, trouble-free, low-cost service—is yours **in advance** when you standardize on Grand Rapids Ice Cream Cabinets.

Why is this so? **Because** Grand Rapids Cabinets have so unfailingly made good over a long term of years that they have built the largest business of its type in the world. **Because** the utmost in scientific refrigeration and time-proof quality is built into these cabinets. **Because** this company stands “four-square” back of its products and always has practiced this policy.

It is worth a great deal to know in advance that you are RIGHT, that your investment in cabinets is both safe and advantageous to your business. You can take the first step in this direction by sending today for a catalog of our complete line, including those two famous models, the Style 7 and the ZERO Brick Cabinet.

WORLD'S LARGEST MANUFACTURERS OF ICE CREAM CABINETS

REMEMBER THE DATES FOR YOUR STATE CONVENTION—AND BE THERE.

"Good service and good quality can be maintained by making a periodical ice and service charge, as well as a weekly cabinet charge. A dealer should pay for service after delivery of ice cream. The dealer doesn't expect this service from the soft drink man, nor does the butcher when he receives his meat and poultry. Why should the ice cream manufacturer?"

"If we would all stop to consider that ice and salt amount to nearly as much as all other delivery costs, including drivers' salaries, we would have a universal service charge to take care of this abuse. By having a weekly service charge of \$1.00 a route with forty stops means a revenue of \$2,080 a year. Five such routes would amount to over \$10,000. Is this not worth considering?"

"Cost accounting with accuracy and uniformity is the big factor in which the ice cream industry has made but little progress. Only occasional manufacturers have given this phase the consideration which its importance justifies. Costs can hardly be standardized as materials vary in price in different localities. A system properly designed and executed by experts would be excellent for the association to adopt and have followed by every member."

"There are four divisions considered in our cost accounting, namely:

A—Ice cream costs.

1. Materials.
2. Production labor.
3. Factory overhead.

B—Delivery costs.

1. Wages and commission.
2. Truck expense.
3. Cabinet expense and depreciation.
4. Ice and salt.

C—Selling costs.

1. Salesmen's salaries.
2. Salesmen's expenses.
3. Advertising.

D—Administration.

1. Officers' salaries.
2. Offices, salary and expense.
3. Other overhead."

* * *

C. H. Palmer, president of the Dairy Machinery Co., Seattle, spoke upon "Your equipment, its care and protection," in which Mr. Palmer urged the ice cream manufacturers to give more attention to the proper handling of plant equipment, investigation of worn parts which can only be caused by negligence and improper care.

* * *

W. V. S. Robb, the president, in his closing remarks said: "We can only accomplish those things worth while when the full support of the membership is obtained. This is no better exhibited than in a convention where a program is arranged where the interest will maintain itself."

"I have been re-elected president as I believe no one else would accept the office, but I want to stress the importance of realizing and considering that we are not in business just to fatten the purse. Each must undertake to fit himself properly by functioning as a unit in

industry in whichever industry he is engaged. It has been said that the trade association movement is overdone but those who die deserve to die."

"Good fellowship has drawn us together as part of an industry which certainly justifies our existence."

* * *

Notes and Entertainment.

George York, Seattle manager of the J. B. Ford Co. exceeded his past reputation at conventions by shouldering the responsibility of entertainment for the supplymen. On Monday night during the convention the supplymen entertained the manufacturers with a dance, cabaret and refreshments, which proved to be one of the most enjoyable parties ever held. Dancing was interspersed with various entertainers and Vancouver Follies, which concluded with the appearance of George York dressed in true Scotch kilts and sporran, accompanied by his faithful caddy (Jay Kugler) both of whom deviated slightly from the Scotch by a black face impersonation. York ably demonstrated his technique at golf by several difficult drives, such as shooting an egg from under a golf ball, another from the caddy's toe and finally by total destruction of Bill Dreyer's borrowed watch, which was later recovered, much to the relief of said Dreyer.

* * *

On Tuesday night the Vancouver manufacturers entertained with an old fashioned barn dance that completely lifted any formality that existed in any of the members or guests. Each man wore a red bandana handkerchief and a farmer's straw hat, the ladies wearing aprons and poke bonnets. The hall was unique in decorations through the liberal use of baled hay as seats, harness and the usual implements that are seen around a barn being much in evidence. Apples and doughnuts were wheeled in in the good old wheel barrow and cider was passed out direct from the barrel.

* * *

The official banquet and dance on Wednesday night closed the convention. M. R. Sherwood of Vancouver was toastmaster and kept up the interest of everyone throughout the evening.

Presentation of the association's golf trophy was made to George York, who won it in the contest on Sunday preceding the convention. The Vancouver manufacturers provided a gold medal as second prize, which was won by W. C. Loughlin, but as Mr. Loughlin had been called away the previous day the medal was not personally presented.

One of the most interesting numbers presented during the banquet was staged by two Scotch pipers, one being champion of British Columbia. They were assisted by two Scotch lassies, who were excellent dancers.

Bert Walker remembered that the "Campbells (Camels) Are Coming" was a famous old Scotch piece, which he had the pipers pipe, while he followed throwing packages of Camel cigarettes to every guest. Bert bought the hotel cigar stand out of every Camel cigarette they had and added by-play to the evening that brought much applause.

* * *

The ladies' entertainment was in the capable hands of Mrs. Bert Hoy of Vancouver, who arranged the program of tea, theater and card parties for each afternoon.

* * *

Vancouver ice cream manufacturers left nothing undone to provide for every wish and comfort of the visiting manufacturers. With Bert Hoy as chairman and assisted by Messrs. Weller, Exley and Sherwood there was not an idle moment or a wish not generously and speedily provided for.

For Body and Texture — Atlantic

Gelatine is the mainstay of your product. It must be good—dependable. Don't involve yourself in uncertainties with this important feature of your manufacturing.

We have developed a gelatine of exceptional clarity, purity and high viscosity. And so painstaking is our manufacturing process that the quality is always uniform.

It is Atlantic super-clarified Gelatine!

It passes pure food requirements in every state in the Union. It is made from a selection of the very finest materials under a specially developed process. Safeguard texture by using Atlantic super-clarified Gelatine.

The test tube at the left contains Atlantic Super-Clarified Gelatine. Note its clarity—its high viscosity.

**"Purest and Best—
It Stands the Test"**

A Few Pounds Will Tell the Story

Make the test of trying out our gelatine by ordering a barrel from the nearest office. Use five or fifteen pounds and if it doesn't match up with our claims for it, send the unused portion back. We will pay the freight both ways.

Total per cent increase in output for 1923 over 1922.....			.118
* 1922 price, \$1.12 a gallon.			
† 1922 retail price, \$2.14 a gallon.			
‡ Decrease.			

FOR the first time in several years the ice cream industry had a more or less normal year, measured by the good years in the dim past. While the increase in gallonage was .118 and for 1922, 11 $\frac{1}{8}$ per cent there was more of normality throughout the country than for many years previously. We have to go back three years for a decrease, and the good business of 1923 will enhearten the manufacturer, for it is the second good average year in succession.

There have been too many off years in the last decade, caused by one thing or another, for the peace of

mind of those in the business. When a steady, if not large increase, is recorded for two years in succession it leaves hope for the future and the memory of the past struggles and worries is softened. The ice cream manufacturer can smile on the threshold of a new year in anticipation of another good year.

We are speaking now of gallonage and not saying a word about profits at this time. That is another story. Years ago the average manufacturer talked nothing but gallonage. He went to conventions and when asked how he was doing, replied: "Well, I went so-and-so over last year." He was as proud as Lucifer if he could report an increased gallonage. The manufacturers have got away from that line of talk, from bitter experiences in the last few years, but there still is a healthy desire to know the gallonage as of yore.

In gathering the statistics for any industry there must be some term to express growth or loss, and in ice cream it is gallonage. The output is the thing the professors, the statisticians and the convention speakers love to talk about, and therefore this yearly review is eagerly awaited to ascertain the state of the industry. As there is and can be no possible means of knowing the per cent of increase in profits, except for the Internal Revenue Bureau sharps, our statistics have to deal with an intangible figure to show the state of the industry. It probably means even less to the manufacturer than it does to the men who delight in figures, but it does serve to furnish a record of accomplishment which is interesting to all.

The government departments most interested never fail to use these figures when referring to the growth of America's pet dairy industry. Much was said at the recent World's Dairy Congress about ice cream, and the foreigners sat and listened with mixed feelings of awe and mystery. As these foreign delegates talked and went about, their amazement grew, but I will venture to say that not one of them to this day realizes or knows what ice cream means to the people of this country—consumers, farmers and business men. The subject was beyond them. One delegate of prominence in his own land talked as if he thought the Americans were plum nutty about this ice cream; but it was noticed that he stowed away several dishes a day, and it is a safe bet that this is the one story he is telling at home of the strangest thing he found in the New World.

It does seem queer that we should consume 8 to 9 quarts of this national dish per capita in a year while

TAG HOOKS Save Dollars

dairy countries far older seem hardly to know about the delicacy. Such countries as Holland and Denmark, where dairying is supposed to be at the top, know very little about the sweet. It is true that the large hotels serve it, made in the French way, but the common people, and the children, know not the delights of the frozen sweetness.

Of course there has been some progress abroad in ice cream, and the recent congress no doubt will give an impetus to consumption, but for a generation we shall be noted as "the crazy people who eat frozen cream." The farmers of this country ought to rise up and pass resolutions for the ice cream manufacturers, for this craze has given the dairy business a far greater measure of profit and success than anyone has given it credit for. A Hollander farmer of Wisconsin told some of the delegates from his land at the dairy show that ice cream had made him rich beyond anything he ever dreamed in the land back home. He sold nearly all his cream to ice cream plants, got more for it than he could from any other buyer, and most of the skim went to the condensary for the same ultimate purpose.

When it is realized that of the 23,000,000 milk cows in this country, one in 25 of them are working day in and day out to supply ice cream to the masses it ought to set foreign dairymen thinking. The 4 per cent of milk that finds its way into the ice cream factories means the profit to dairying. Without this outlet and with no ice cream dairying would be in a sad state.

So it is a pleasure to be able to collect and collate reports, figures, conversations and other statistics each year to set forth just how the great ice cream industry is getting along. When we are able to state that, after careful weighing of facts and conservative figuring, the industry has gone ahead and sold millions of gallons

more than for the year before, then indeed it is pleasure—so, hurrah for the gallonage, for the time being. Let us hope that the toilers made as much more on the increase as ever.

Retailers Giving In.

It will be noticed that the manufacturers ate in the retail make to some extent. Many retailers went back to buying rather than going to the bother of making their own. A distinct play has been made by manufacturers in certain cities to gain this retail trade. In many cities large retailers have been forced to make their own goods because they wanted a better quality than the wholesalers were willing to provide. That is the excuse the retailers offer in most cities, but it is not always true. For instance, the average wholesale ice cream in Philadelphia is far better than the average run of retail make and from the price reduction there the retailer has very little cause to make his own. With 10, 11 and 12 per cent ice cream selling for a dollar an under, and with free ice and service, it is difficult to see where the retailer is better off in making his own. He also gets the benefit of extensive advertising.

In New York City, the largest center of retail store make in the country, the quality of ice cream made is not as good as the average wholesale make, at this time. Things are changing in the metropolis and they will change faster in 1924. A nice little ice cream war is on and it will be a good one while it lasts. Not only quality and price will change, but selling will be keener. It is expected that many retailers will be won over to the factory product. It must be set down that the retail make in the greater city is above 2,000,000 gallons a year, which is quite some output.

The figures on the wholesale and retail prices in the table at the head of this article will be instructive. Just a word about them. It was difficult to arrive at an average on either quotation on account of the widely varying prices sent in from different parts of the country. In some fair sized cities ice cream has been sold as low as 85 cents a gallon. Yep, and as far as the writer knows these men have staved off the sheriff. In some large cities the wholesale prices were from \$1.20 to \$1.40, and in a few instances, \$1.50 a gallon. The highest figures were for brick. The Philadelphia price was around a dollar all the year.

While the writer believes in the lowest price possible to the consumer, consistent with a good profit, it hardly seems possible that 10 per cent can be made for the year at a dollar and under. An ice cream manufacturer is entitled to 15 per cent profit when he gets it, for goodness knows he has many years when he is lucky to get out whole. There are so many hazards

Eighteen miles daily over a hilly route in ice cream delivery work

"And operating much more economically than any other type of trucks in our experience."

This is what Mr. J. A. Williams, President of the Williams Ice Cream Company of Scranton, Pa., said about his 3½ ton C-T Electric Trucks. Then he added:

"Our experience has been decidedly satisfactory. The trucks will go anywhere we want them to when the roads are passable and within range of their battery capacity."

The Williams Ice Cream Company operates in a city of hills. Their routes extend through the residential hill section and into the center of the city. Four of these routes are served by C-T Electric Trucks and their reliability under severe working conditions is vouched for by Mr. Williams.

Many successful ice cream manufacturers are depending upon C-T Electric Trucks to cover their many-stop city routes. They are placing their delivery equipment on a sound economical basis by purchasing C-T Trucks and adding to their fleets as their business grows.

Ask us for Gould Audited Reports on C-T Electric Trucks in Ice Cream delivery. Learn how other ice cream manufacturers are profiting by the use of C-T's.

"All of our C-T Electric Trucks have proved very satisfactory."

in the business that 15 per cent profit ought not to be considered extortionate.

Knowing the general wholesale prices in nearly every city of 75,000 population and up and with a little guessing at the small cities we arrive at the wholesale price of \$1.09. If this is off the actual average for the country it will be found only a cent or two under.

The same process was carried out with the average retail price, and this figure is more likely to be several cents out of the way than the wholesale price. In many of the Atlantic and Middle West cities bulk ice cream could be bought in hundreds of stores for 45 cents a quart; a small percentage sold for 40 cents; probably a half of them asked 50 cents a quart; and only 15 per cent of the stores charged 55 and 60 cents. In many small places the prevailing price was 45 cents. So this average figure of 48 cents cannot be far out of the way. The retail price was quite a drop from that prevailing in 1923. For four years the retailers made more money than the manufacturers, and they held back trade by keeping prices high too long; but constant hammering at them showed that the policy of smaller profits and more business was sound. The drop of four cents a quart in retail prices, the 5-cent cone and the 5-cent bar had a lot to do with the increased gallonage in 1923. But the manufacturer got back a little of that velvet he has been missing for five years.

Valuation of Plants.

Another thing ought to be pointed out—the valuation of plants. It is reaching figures that ought to be studied. When a dollar investment can turn out only \$1.10 in sales it is time to call in the efficiency man or a guardian. There is one vital thing the industry is facing, and which is the biggest menace meeting it, the high cost of increasing business. Think it over.

Fifteen years ago, when a 10 to 20 per cent increased gallonage came upon a man, all it cost him was another wagon, a few cans, tubs and a dozen cabinets, yes, and a bit more ice and salt. Now the same man is lucky if he gets off with an expenditure of \$10,000 to \$25,000 for that small increase in business, which may pay a net profit a gallon, but most likely will not.

On all sides is heard the whine of the manufacturer: "We did more business than last year, but we do not seem to be able to make any more profits." It's true, and pity 'tis, 'tis true. We have a long way to go to make this a scientific business, but we will get there in the near, coming years.

PACIFIC ICE CREAM MANUFACTURERS' CON- VENTION PROCEEDINGS.

(Continued from page 76)

A California delegation to the convention composed of 14 active and associate members left San Francisco November 30, arriving at Vancouver Sunday, December 2. Several of the party learned much about dollar limit and one member with a drawing room provided an excellent brand of fruit juice en route.

THE PERFECT MAN.

There is a man who never drinks,
Nor smokes, nor chews, nor swears;
Who never gambles, never flirts
And shuns all sinful snares—

He's paralyzed!

There is a man who never does
A thing that is not right;
His wife can tell just where he is
At morning, noon and night—

He's dead!—Exch

DAIRY INDUSTRY SHORT COURSES CLOSE WITH LARGE ATTENDANCE.

The Dairy Industry Short Courses in Market Milk, Butter, Cheese and Ice Cream closed at the branch of the College of Agriculture, Davis, Cal., on Thursday, Feb. 14, with the largest attendance of any previous year. There were eighty-five enrollments in the various courses, representing men from twenty-nine counties in California and representatives from seven states.

The California Butter, Cheese and Ice Cream Makers' Association held its annual meeting on Feb. 14th, the last day of the short courses. The name of the organization was changed to the California Dairy Industries Association, since many of the members were milk plant operators who are engaged in other branches of the dairy industry, not included in the former name.

The association conducted judging contests in which the members judged the quality of butter, cheese, milk and ice cream. M. A. Salis of Bakersfield was first in market milk; Glenn Barrass, University Farm Creamery, Davis, was first in butter; H. C. Watson, Alturas, was first in cheese, and C. Wreden, University Farm Creamery, Davis, was first in ice cream. Glenn Barrass, butter-maker at the University Farm Creamery, was the highest individual in the judging contest and is to have his name engraved on the silver trophy donated by Orchard Farm.

In the afternoon, Prof. L. J. Richardson, head of University Extension, told the association of the increased tendency toward adult education. He described the methods now being employed by England and other countries, and said that he believed some of their practices would soon be adopted in this country. He was followed by B. H. Rawl, assistant general manager of the Golden State Milk Products Co., who addressed the association on the subject of "Working Together," and pointed out what function each individual must play in the organization. Dr. C. L. Roadhouse, head of the Dairy Industry Division, presided at the annual banquet in the evening; Prof. E. D. Merrill, newly appointed dean of the College of Agriculture, for the first time attended a function of this kind and told of his plans for carrying on the scientific work of the college. The meeting also was addressed by S. H. Greene, secretary-manager of the California Dairy Council, and by former Dean Van Norden and B. H. Rawl. L. A. Raffetto, retiring president of the association, presented the prizes to the winner of the dairy products judging contest.

WOULDN'T GIVE IT UP.

Miss Cora was taking her first trip on the train. The conductor came through and called for the tickets. Cora dilly gave up her ticket.

A few minutes later the butcher-boy coming through asked, "Chewing gum!"

"Never!" cried Cora bravely—"You can take my ticket, not my chewing gum."

What Constitutes Quality?

Logical Way of Determining Importance of Characteristics Necessary to
Make Good Ice Cream is to Give Them Numerical Value—Relation of Acidity to Quality—Relation of Overrun to Quality—Use of Dehydrated Egg Yolks as Filler

THERE is no food product that is more variable than is ice cream. Not only does its chemical composition and food value vary greatly, but its physical makeup and palatability also vary. If this industry is going to prosper as an industry, those engaged in it must do their utmost to make the name "ice cream" mean something.

What constitutes quality in ice cream? It is not the intention of this paper to discuss fat standards, overrun or weight standards, but I should like to say that a legal standard is supposed to set minimum and maximum limits and it does not attempt to furnish a recipe for the ideal composition of ice cream.

There are certain characteristics necessary to make ice cream good. It seems to me that one of the most logical ways of determining the importance of each of these various characteristics is to give them a numerical value; in other words, make up a score card rating these various characteristics according to their value toward giving quality to ice cream, keeping in mind the ideal, the characteristics of which would have a total value of 100 points.

There are numerous score cards that have been used by various institutions and individuals. The one which we use is of our own compilation, but it is quite similar to others in use. There may be some who would give different values from those which we have given the various characteristics, and they may do so if they wish, but at the same time we will have something definite to deal with and we will be able to understand each other.

The following score card is one which we have found to be very useful in making comparisons in our experimental work:

Flavor	50
Cleanliness of flavor	20
Richness	20
Flavoring material	10
Body	40
Texture	25
Resistance	15
Color	5
Package	5
	100

THE appearance of the package and the color of the ice cream are important and must be considered because of their effect upon the salability of the product. However, just as the old saying goes, "nine-tenths is in the eating of it." The characteristics which affect the palatability must receive the greatest consideration. Therefore, these receive ninety points. As will be noted, the flavor is considered as being important enough to receive fifty points. Of these fifty points, twenty are allowed for cleanliness of flavor, twenty for richness of flavor, and ten for the quality of the flavoring material

* Head of Department of Dairy Husbandry, University of Illinois. Address before Illinois convention.

Factors Which Produce Quality

By PROF. H. A. RUSHES*

ness of texture and resistance or standing up quality. The body of the ice cream is very important not only from the standpoint of its carrying quality, but from the standpoint of aiding flavor in giving the desired palatability. Therefore, forty points are allowed for body, twenty-five of which are allowed for texture and fifteen for resistance. Not only must ice cream have a fine close texture to be smooth, but it requires a certain resistance in order to give the perfect velvety body, and the standing up quality which is so necessary. However, too much resistance is almost as undesirable as it is enough. Ice cream should not be gummy or sticky but it should have that mellow creaminess which is pleasing.

As you will note, there are no points in the score card allowed for composition. However, the richness of flavor and the texture and resistance are dependent upon both the chemical and physical composition of the product. Different consumers have different ideas regarding the richness of the product, and hence no definite fat standard is used in the score card, but the fat content must meet the legal standard or it can not be legally called ice cream. However, the fat contents really only one of the important characteristics of a good ice cream. No matter how rich the product may be, if the ice cream does not possess the other characteristics to the proper degree, it will be a product having inferior quality.

It is not intended that the score card should be used every time one desires to judge a certain lot of ice cream. But the score card does add definite values to the various characteristics that go to make a good product, and it should form a basis of good judgment, and make the criticism more understandable.

* * *

RELATION OF ACIDITY TO QUALITY IN ICE CREAM.

By Prof. P. H. Tracy.**

ALTHOUGH acid is ordinarily present in the ice cream mix in relatively small amounts, it has an important bearing upon the quality of the finished product. For a proper understanding of the acidity factor in ice cream making, one should know something of the effect of the acid and the approximate amount that is ordinarily contained in the fresh mix, as well as the effect upon the quality of the ice cream of increasing or decreasing the acidity. In other words, the ice cream maker should be able to answer these two questions: First, How much acid does the freshly prepared mix ordinarily contain? Second, Are there any advantages to be gained by increasing or decreasing the acidity of the mix?

Gaulin
Homogenizer
Type 400
Motor Equipped

More Than 100% Gain in Efficiency with this New 2-Stage Gaulin Valve—

THE Manton-Gaulin Mfg. Company's latest development in homogenizing devices is the Gaulin 2-STAGE VALVE. Unquestionably, this device is far in advance and superior to anything of its kind on the market today. Efficiency, long life and adaptability are built into it and leave nothing to be desired.

Over 100% Gain in Efficiency— Absolute Control of the Mix

Not only is the homogenizing efficiency increased over 100 per cent with the 2-stage Gaulin, but in addition it is now possible to so effectively control the mix that the degree of homogenization and the body of the mix after homogenizing bear no relation to each other. In other words, the product may be thoroughly homogenized and yet be as light in body as when it left the pasteurizer, or it may, at will, be made so heavy and viscous, that it will not run over the cooler.

Unnecessary to Limit Degree of Homogenization

Thorough and complete homogenization is essential to a smooth, velvety product, but up to the present time the advantages of thorough homogenization have been denied many ice cream manufacturers due to the fact that too heavy a body resulted if the pressure was increased sufficiently to obtain a thoroughly homogeneous product.

With the 2-stage Gaulin it now becomes possible to manufacture a finer grain and better quality ice cream, and at the same time tremendously increase operating efficiency.

With all these advantages in addition to the fact that the 2-stage valve has been proven over 100 per cent more efficient than the single Gaulin Valve, which for years has been the Standard of Efficiency, it will be readily seen that the Manton-Gaulin Mfg. Co. has developed a valve which is the most conspicuous advance ever recorded in the history of homogenizing. *Ice cream manufacturers can't afford to be without it.*

With the increased economy in manufacture due to greater production, we are enabled to equip the Gaulin Homogenizer with the 2-stage valve, at no increase in price.

We can recommend the Gaulin Homogenizer absolutely as a money-saver and money-maker in your plant—won't you let us tell you more about it?

Department B

ADVANTAGES of the New 2-Stage Gaulin Valve

- Over 100 per cent gain in efficiency. Comparative tests show 150 per cent greater reduction in size of fat globules with the 2-stage Gaulin than was possible with the single Gaulin Valve.
- Permits using a lighter mix and eliminates waste of time and materials caused by handling an extremely heavy and viscous product.
- Viscosity or body of mix absolutely under control.
- Unnecessary to limit degree of homogenization—"The more complete the homogenization the finer the finished product"—*Government Bulletins*.
- Its increased efficiency produces a finer ice cream at no increase of power consumption.
- All the foregoing advantages obtained with no increase in price.

Manufacturer's Guarantee

The manufacturers of the Gaulin Homogenizer positively guarantee that the Gaulin 2-Stage Valve will produce a better emulsion than any other homogenizing device on the market today.

What DELFT Has Done for Users of Gelatine

Do you remember the uncertain and unsatisfactory condition of the gelatine industry before DELFT entered the field?

Compare it with present conditions, when every shipment of DELFT Gelatine is accompanied by a scientific analysis of its contents; when every shipment is guaranteed free from harmful and liquefying bacteria when delivered; its color and clarity and strength *absolutely uniform*.

The example of DELFT has been followed by others, resulting in the raising of standards throughout the trade. But the ideals which gave DELFT its leadership will continue to keep it *the World's Best Food Gelatine*.

The Gelatine You Eat

How the Pure Food Laws Restrict the Raw Materials of which It Is Made

By A. G. Ingalls

GELATINE, that exquisite confection that melts away in the mouth into cool, fragrant nothingness is assimilated by the stomach quicker and with less effort than any known food. Hospital physicians, as well as hospital patients are so well aware of this fact that it finds a large place in the diet of the sick. That those who are well owe it almost goes without saying. When the appetite palls and we seem to crave nothing at all, gelatine by some magic, slips down the throat and leaves a sense of well-being without a sense of qualm. In food value it is almost equal to sugar and like it, it supplies heat and energy to the body without burdening the digestion with proteins. Gelatine is not only a well-earned dessert but it is food.

The quaint old Dutch city of Delft, noted for rare porcelains is also noted for its manufactures of gelatine. To its quays come tramp ships laden with cargoes of bones from India; while other ships carry to the United States large consignments of gelatine that has been made from these bones. More gelatine is used by the United States than all the rest of the world put together, for we are the greatest consumers of ice cream in the world and it is a fact that over 90 per cent of the commercial ice cream made in this country contains gelatine. The next time you eat ice cream remember that one of its important constituents probably came from India and was derived from animal bones.

Bones from India? Bones of what? Not old bones bought of the rag-pickers! No, gelatine of the kind that is made in the Netherlands is made from the carefully selected shin-bones of the East Indian water buffalo. This is not the buffalo that once roamed the "Great American Desert" in seemingly inexhaustible numbers. It is not even a wild animal. In India the water buffalo takes the place of the horse. It is the principal farm animal. It is domesticated. But the Hindu does not eat water buffalo—any more than he eats beef. Buddhism forbids either the eating or the killing of all animals and it is because of this religious taboo that ninety thousand tons of sun-bleached and de-fatted buffalo bones are available annually for the manufacture of gelatine, as well as of bone buttons and Japanese ivory carvings.

Gelatine is found in the bones of most animals, as well as in certain of their tissues and membranes, and its easy availability derives from the fortunate fact that while insoluble in cold water, it is easily soluble in hot. When cooled, it forms a jelly which is able to include within its mass from five to ten times its own weight in water.

In a chemical sense, ignoring the highly important considerations of freedom from harmful bacteria and certain chemicals introduced in manufacture, common glue is not greatly different from gelatine. However, little pains need be taken to insure that glue should be germ-free. Its essential quality is its stickiness. As long as it is sufficiently sticky it makes little difference what part of the animal, nor what that matter, what animal, it comes from. Glue is often decidedly offensive to the nostrils because there is no particular need to keep out the bacteria that produce decay. Almost any pure food will decay—unless steps are taken to prevent

One of the chemical laboratories in a Dutch gelatine manufactory, where gelatines are tested.

it. But instead of saying that gelatine is a sort of glorified glue, let us say that glue is often a debased and unclean gelatine. Many of the manufacturers of gelatine also make glue, generally in separate factories or in separated parts of the same general factory group. By their knowledge and equipment they are better able to make it than others, but they are decidedly careful about keeping these two branches of manufacture unscrambled. Otherwise the pure food laws would reach out for them in short order. Gelatine imported from the Netherlands is made from clean raw material and the processes take place in as clean an environment as only the scrupulously, insistently clean Dutch people know how to maintain. The old joke about the Dutch housewives getting down on their knees and scrubbing the very sidewalks is based on fact—they do it. It is difficult to see how the husbands of these ever-scouring, irrepressibly energetic Dutch women can derive any solid comfort or repose from their home life.

The full process of making gelatine requires from four to six weeks of continuous day and night work. First, the sun-bleached, degreased bones are treated in a vat for several days in a weak solution of muriatic acid. Gradually the mineral matter in them, such as calcium or lime phosphate, and the carbonates of calcium and magnesium are dissolved out, leaving behind the material which contains the gelatine in its unfinished condition. An experiment which is analogous to this process may be tried out by any one by placing a bone from the table in a weak solution of hydrochloric acid and leaving it several days. The instructive part of the experiment consists in the discovery, made after the solid matter is gone and a soft glutinous core is left, that bone contains so much within itself that is not bone. As much as 60 per cent of the volume of some bones consists of gelatine.

The residue that remains in the vat after the treatment with acid is next washed many times with pure filtered water. The purpose of this is to remove practically all of the chemical compounds formed when the acid unites with the minerals forming the rigid part of the bone. Just as in careful chemical work, clean, filtered water is used for this purpose.

Following this the stock is treated many times with lime water, removing any fats that may be present, and at the same time loosening the fibers and releasing the gelatine. Then the stock undergoes several

washings and goes to the vat for the next process, which is the boiling.

The purpose of the boiling is simply to extract the gelatine, since it is soluble in hot but not in cold water. After the first boiling most of the gelatine rises to the top, where it is drawn off. Several successive boilings at increasing temperatures (necessitating that the liquid be contained in a tight boiler in order that higher temperatures may be arrived at) free practically all of the gelatine. Of course, the strongest gelatine comes off with the first boiling, just as by far the most of the coffee is extracted from the coffee grounds with the first water.

The gelatine which has been drawn off is now run through pipelines into a specially cooled room where the thin, hot liquid soon cools into a jelly-like mass. It is then cut up into sheets and placed on nets over wooden frames which are conveyed to a long alley through which a strong current of hot, dry air is blown. The purpose of this is to remove the moisture in the sheets, and the greater part of it is removed there. This puts them in condition to be ground up, ready to be packed in the common granulated form for use. The long process of manufacture is now completed.

But before it is put out on the market the gelatine must be tested and graded. Each run is tested independently by several chemists, and these tests are of two general kinds. One has in view the determination of the number of bacteria, if any, present; the other, the percentage of unessential chemicals contained. In both these regards the gelatine must conform to the rigid requirements of the pure food laws of the United States, as well as the often more rigid requirements of individual States such as, for instance, Pennsylvania and North Dakota. It is claimed that the gelatine imported from the Netherlands is higher in purity than the requirements of the American pure food laws demand.

Gelatine is without doubt known by most of us as a dessert. But there are other outlets for it that are still more important. Most of it is used in the manufacture of ice cream in the United States than for any other purpose, this immense industry accounting for 8,000,000 pounds of gelatine annually. This amounts to about double the quantity consumed as a table jelly. The American candy industry uses another three million pounds every year.

In addition to these uses, gelatine is found in a large and varied list of commercial products. A few of these are pharmaceutical products such as capsules and coated pills prescribed by the physician. Not a photograph could be taken, not a motion picture shown without gelatine, although the gelatines used to coat the photographic film need not be as pure as those which regale us after a hearty dinner. The standard set by the Federal food laws for food gelatines permits, out of one million parts (not one thousand) only 30 parts of copper; 100 of zinc; 20 of lead; 350 of sulfur dioxide; and 1.4 of arsenious oxide, or less than one part in 700,000 of the last named. But many table gelatines are now made so carefully that they contain only one-fiftieth of these mineral allowances. Thus they are fifty times as pure as Uncle Sam requires them to be.—Paid Advertisement.

How Much Acid Does a Freshly Prepared Mix Ordinarily Contain?

A certain amount of acidity is present in all normal milk products. Milk freshly drawn from the udder has an acid reaction, due to the presence of certain acid phosphates. This is termed apparent acidity, which in herd milk averages about 0.14 per cent. But the acidity with which the ice cream manufacturer is most concerned is called real acidity and is due to the action of certain bacteria which form lactic acid from milk sugar. However, the term acidity usually includes both apparent and real acidity.

The amount of acid in any milk product depends upon the age of the product, the treatment and care which it has received, and its solids not fat content. Since lactic acid is contained in the milk serum, and since certain of the serum solids have an acid reaction, there is a direct relation between percentage of milk solids not fat and the acidity. It is for this reason that 40 per cent cream which contains about 5.5 per cent milk solids not fat, contains less acid than does the milk from which it is skimmed, which has about 8.7 per cent milk solids not fat. As lactic acid is only slightly volatile, there is also a close relation between the percentage of acid and solids not fat in condensed milk products.

So it is to be expected that all normal milk products will contain a certain amount of acid. Since ice cream mix contains a mixture of milk products such as cream, milk, and condensed milk or milk powder, the mix will contain some acid. The amount of acid in a freshly prepared mix will depend upon the acidity of the different milk products from which it is made and the relative amount of each used. A mix with 10 per cent

fat and 15 per cent milk solids not fat has a higher acidity than has one made from the same products but containing 15 per cent fat and 10 per cent milk solids not fat. This condition results from the direct relation existing between acidity and the percentage of milk solids not fat. When the mixed milk received at the plant averages about 0.16 per cent acid the freshly prepared mix should contain approximately 0.0175 per cent acid for each per cent of milk solids not fat, assuming, of course, that the milk is properly handled and cared for before it becomes a part of the ice cream mix.

Are There Any Advantages to be Gained by Increasing the Acidity?

To answer this question, it is necessary to know the relation existing between the amount of acid present and the following factors:

1. Viscosity of the mix.
2. Overrun.
3. Texture, resistance and flavor of the ice cream.

At the University of Illinois we are conducting an investigation of the use of the homogenizer in ice cream making. As a part of the preliminary work on the project we made some study of the acidity problem, the results of which throw some light upon the points just mentioned.

THE effect upon the viscosity of the mix of the presence of different amounts of lactic acid is shown by data in Table 1. A batch of mix was divided into 50 pound lots, and the acidity was standardized by the addition of lactic acid. The mixes were then homogenized at a 2,000-pound pressure and held over night at about 35 degrees F. Just before freezing, the acidity and viscosity of each batch were determined. The acidity determinations were made by titrating 9 grams by weight of the mix with tenth normal sodium hydroxide. The viscosity determinations were made with a 17.6 cc pipette and were conducted in the room in which the mixes were stored.

Table 1. Effect Upon Viscosity of Increasing the Acidity.

Mix No.	Acidity per cent	Viscosity second
Series 1 1a (control)	0.205	431
1b	0.240	236
1c	0.275	44
Series 2 2a (control)	0.225	349
2b	0.275	80

These data show that the addition of lactic acid to the mix had a tendency to decrease the viscosity.

Also makers of the famous line of PAVESCO Paper Milk Bottles.

ity with the effect of increasing it, the amount of acid in different lots of the same mix was standardized by the addition of either sodium bicarbonate or lactic acid, depending upon whether the acidity was to be raised or lowered. The work was conducted in the same way as explained above. Representative results are shown in Table 2.

Table 2. Comparison of the Effect of Sodium Bicarbonate and Lactic Acid Upon the Viscosity of the Mix.

Mix No.	Treatment	Acidity per cent	Viscosity seconds
Series 3	1a Neutralizer added	0.05	81.5
	1b Neutralizer added	0.10	31.4
	1c Control	0.20	16.0
	1d Acid added	0.28	13.2
Series 4	2a Neutralizer added	0.05	127.0
	2b Control	0.23	17.0
	2c Acid added	0.27	17.0

It is evident from these data that neutralizing the acidity had a greater effect upon viscosity than increasing the acidity, and that the tendency was for the viscosity to decrease with an increase in acidity.

In the light of the data in Tables 1 and 2, it seems reasonable to conclude that within certain limits an increase in acidity tends to decrease the viscosity. This no doubt is due to the tendency of an acid to destroy an emulsion. Of course, it would be possible to increase the acidity to such an extent that the casein would be precipitated, thereby increasing the viscosity. However, the injurious effect upon the quality of the ice cream would make such a procedure out of the question.

SOME ice cream makers believe that a certain amount of acidity is necessary in order to obtain the desired overrun. That such is not the case is shown by the data in Table 3.

Table 3. Relation of Acidity to Maximum Overrun.

Part I. Effect Upon Overrun of Increasing the Acidity.			
Mix No.		Acidity	Overrun
1		0.205 (control)	128
	1a-1	0.205	128
Series 1	1b	0.24	115
	1b-1	0.24	120
1c		0.275	107
	1c-1	0.275	115

Part II. Comparison of the Effect of Sodium Bicarbonate and Lactic Acid Upon the Overrun.

Mix No.	Treatment	Acidity	Overrun
Series 3	1a Neutralizer added	0.05	145
	1b Neutralizer added	0.10	180
	1c Control	0.20	160
	1d Acid added	0.28	155

These data show that although in some cases there was a tendency for the addition of acid to decrease the maximum overrun, in general there was very little relation between acidity and overrun. The same thing is shown by the following averages, which were secured from fifty-seven batches of homogenized mixes, varying in acidity from 0.05 to 0.34 per cent and having an approximate composition of 10 per cent fat, 12 per cent milk solids not fat, 12 per cent sugar, 0.5 per cent gelatin and 0.5 per cent vanilla.

No. of Batches	Range of Acidity	Average Overrun
24	0.05—0.14	142.2
17	0.20—0.24	149.5
16	0.25—0.34	148.0

It may be concluded, therefore, that increasing the acidity of a mix will not increase the overrun.

3. The Effect of Acidity Upon Texture, Resistance and Flavor in Ice Cream.

Samples were taken from each of the 81 batches frozen during the investigation, for the purpose of comparing the quality of ice cream differing only in the amounts of acid present. The samples were all taken when an overrun of 100 per cent had been obtained. A score card was used in judging the samples, which were criticized by four members of the department. The data show that in general by increasing the acidity in a mix the texture of the ice cream became slightly less smooth and the resistance was decreased somewhat. On the other hand the data indicate that neutralizing the acid in a mix improved the texture of the ice cream and increased the resistance.

In general, the flavor of the ice cream containing about 0.2* per cent acid was the best. Neutralizing below 0.1 per cent usually resulted in a soapy flavor. Often a strong alkali flavor that could be detected in the freshly frozen ice cream to which neutralizer had been added would not be noticeable after three or four days.

* The mixes used in this investigation contained approximately 12 per cent milk solids not fat.

Increasing the acidity by the addition of lactic acid caused the ice cream to have a less desirable flavor.

ALL milk products, even when fresh, contain a certain amount of titratable acidity. The amount of acidity in a mix depends upon the percentage of milk solids not fat which it contains, and the care and treatment of the mix, as well as the care and treatment given the milk products from which it is made. Assuming the mixed milk received at the plant to have an average acidity of 0.16 per cent, a freshly prepared mix should contain about 0.0175 per cent acid for each per cent of milk solids not fat. Neutralizing the acid in a mix increases its viscosity, whereas, increasing the acid decreases the viscosity. Increasing the acid in a mix does not increase the overrun. An increased acidity usually results in poorer texture, less resistance and a less desirable flavor in the ice cream.

The data presented lead to the conclusion that in order to produce high quality ice cream, the mix should be treated in such a way as to retard as much as possible the development of lactic acid.

Relation of Overrun to Quality in Ice Cream.

The amount of overrun that should be obtained in the freezing of ice cream is a debatable question. One of our leading manufacturers instructs his ice cream maker to obtain about one hundred per cent swell. Another manufacturer, located in a nearby city, limits his overrun to sixty-five per cent. On the other hand there are some who disregard the overrun factor entirely and draw the ice cream whenever it appears to be properly frozen. There are still other manufacturers who intentionally incorporate so much air in their ice cream that it has the consistency of snow. They are men who cause

the retailer and consumer to lose faith in the integrity of the ice cream industry as a whole.

Relation of Overrun to Texture and Resistance.

During our experimental work at the University of Illinois we took samples of ice cream with different amounts of overrun for the purpose of determining the effect of overrun on quality. The samples were scored after they were properly hardened. Representative data of this work are given in the following table:

Comparative Scores of Ice Cream of Different Overrun.

Series	Sample	Fat M.S.N.F. Overrun			Texture	Resistance
		%	%	%	Perfect Score	Perfect Score
I	1	8	8	75	25	25
	2	8	8	100	18	12.5
	3	8	8	120	17	12
	4	8	8	150	15	11.5
II	1	10	12	75	14	11
	2	10	12	100	22.5	15
	3	10	12	125	22	15
	4	10	12	150	19	13
	5	10	12	175	18	11
III	1	14	10	55	16	10
	2	14	10	75	23.5	14
	3	14	10	100	24.5	14.5
	4	14	10	125	25	15

From these data it is seen that there was a direct relation between overrun and the texture and resistance of ice cream. A decrease in overrun usually caused a smoother texture and increased the resistance. In some cases the resistance was so great at the low overrun that the ice cream was "doughy." This accounts for the lower resistance score of sample No. 1, Series III, which had a 55 per cent overrun and a 14 score, than sample No. 3, Series III, which had a 100 per cent overrun and a 15 score.

It is also evident from these data that the amount of air incorporated should be gauged, in part at least, by the composition of the ice cream. The lower the milk solids, the less overrun there should be in order to make a satisfactory product. By comparing the score of sample No. 2, Series I, which contained eight per cent fat and eight per cent m. s. n. f. and had an overrun of 100 per cent, with the score of sample No. 4, Series II, which contained 10 per cent fat and 12 per cent m. s. n. f. and had an overrun of 150 per cent, it will be noted that the scores are very nearly the same, the difference in composition being offset to a great extent in this case by the difference in overrun.

That there is a lower limit to the amount of air that

Hudson's
No. 52 SPECIAL
 A Vanilla Flavor of Superior Quality
 and Strength

When Summer Comes

In less than 60 days what is expected to be a "bumper" ice cream season will be on. There'll be no time then to test the merits of flavoring extracts. **Now is the time to do that.**

When you buy vanilla flavor you are interested in not more than three essential point, viz.:

Does it have a smooth, velvet, delicious, want-more true vanilla taste?

Will it freeze out in the hardening room?

How far will it go, or how long will it last?

The claims of HUDSON'S NO. 52 SPECIAL—that "it tastes better," "lasts longer," and "will not freeze out" have been substantiated by ice cream men all over the country for nearly 40 years. We make those claims to you and are willing to prove them entirely at our risk.

HUDSON'S FAMOUS ICE
 CREAM FLAVOR, CONCENTRATED No. 52

Six times stronger than Extract
 \$25.00 per Gal. Special prices in quantities

HUDSON'S FAMOUS ICE
 CREAM FLAVOR No. 52
 SPECIAL

\$5.00 per Gallon.....in Barrels
 \$5.50 per Gallon.....In Kegs

Let us ship you a sample keg of No. 52 SPECIAL extract or a sample gallon of Hudson's Concentrated No. 52—Express or freight prepaid to your city. You may return same at our expense if not entirely satisfactory.

should be incorporated in some ice cream is shown by the data in the third series of mixes. At 100 per cent overrun the texture and resistance both received a perfect score. At 75 and 55 per cent overrun the ice cream was less smooth and the resistance had increased to such an extent that the product had a gummy consistency. In this case an increase in the amount of overrun improved the quality of the ice cream. It is evident, therefore, that a certain amount of overrun is necessary in order that the ice cream shall have the best quality.

NO SET rule can be given as to the proper amount of overrun because of the fact that there are so many different factors that may affect the quality of ice cream. For instance, an unhomogenized ice cream with a 90 per cent overrun will not have the same texture and resistance as a homogenized product of the same overrun and composition and made from the same ingredients. Neither will an ice cream containing skim milk powder be comparable to one in which superheated condensed milk is used. Since ice creams of the same composition may vary in quality the manufacturer should study his own conditions and by experimentation determine the proper amount of overrun for his particular product. As overrun has such an important bearing upon profits as well as upon quality in ice cream a safe rule to follow is to incorporate the maximum amount of air that will result in an ice cream having the desired texture and resistance.

The Use of Dehydrated Egg Yolks as a Filler in Ice Cream and Their Relation to Quality.

Fresh eggs have long been used in ice cream as they were thought to improve the flavor and body of the finished product. During recent years, however, the

high price of fresh eggs has prohibited their use in the mix. Interest in this product is now being revived through the development of methods of dehydrating the fresh eggs which has made available for use in this country the cheaply produced eggs of China.

Both the spray and drum processes are used in the manufacture of dehydrated eggs. The processes are somewhat similar to those used in the preparation of milk powder. Both the dehydrated yolks and albumen are to be obtained but the yolks are used to a greater extent in ice cream than is the powdered albumen.

The powdered yolks contain from 50 to 60 per cent fat and about 95 per cent total solids. About six dozen yolks are required to make a pound of the dehydrated product.

At the suggestion of the Illinois Association of Ice Cream Manufacturers, we have begun an investigation of the use of dehydrated egg yolks in ice cream. For this purpose a comparison was made of the ice cream prepared from the same mix but containing different amounts of egg yolk. Mixes with three different amounts of milk solids were used, one with 8 per cent fat and 8 per cent milk solids not fat, one with 10 per cent fat and 12 per cent milk solids not fat, and a third containing 14 per cent fat and 10 per cent milk solids not fat. In each series a comparison was made between the ice cream containing no egg yolk, one containing four ounces, one containing six ounces, and one containing eight ounces, per 50 pound batch.

An attempt was made to secure some information relative to the effect of the different amounts of egg yolk upon the following factors:

1. Viscosity of the mix.
2. Overrun.
3. Texture and resistance of the ice cream.
4. Flavor of the ice cream.

Viscosity of the Mix.

The data obtained, so far, do not warrant the drawing of definite conclusions relative to the effect of the powdered egg yolk upon the viscosity of the mix. When the yolk was added to the mix after homogenization the viscosity was sometimes decreased and other times increased. However, in most cases in which it was added to the mix before homogenization the viscosity was decreased.

Overrun.

Usually those mixes to which the egg yolk was added after homogenization yielded a lower maximum overrun than those to which no yolk had been added. However, reverse results were obtained when the yolk was

ESKIMO PIES

If you are making 5 cent Pies you need a Thin Flowing Chocolate Coating. —USE

Fortune's "Thinflo"

"THINFLO" produces a thin shell-like covering, has a delicious flavor, comes all ready for use (no additional butter required) and is most economical because of the great number of pies covered.

"THINFLO" was used on the Anderson Eskimo Pie machine at the Cleveland Convention.

What Is Heathization

By a Leading Manufacturer

"Heathization" is the science of keeping air out of food products. Being interested in candy, you doubtless know that by far the larger percentage of marshmallows consists of tiny bubbles of air. Butter contains 10 per cent of air by volume in imprisoned bubbles, and ice cream must contain quite an appreciable quantity of air bubbles or bubbles of some other atmosphere, else it would be a solid, frozen block of sweetened cream ice wholly unpalatable.

Air is very damaging to foods, especially when it is permanently sealed within the food mass. Air damages a bottle of preserved fruit. That is why our good housewives are so careful to seal it air-tight. When you bite into an apple and expose the pulp to the air, the chemical action of the air turns the apple brown very quickly.

Now Heathization is the new science of keeping the air out of bread, butter, ice cream and certain kinds of beaten candies and instead of air, a natural food atmosphere is employed. This atmosphere is a pure, dustless, sterile atmosphere called carbon dioxide. It occurs in natural spring waters and in sparkling wines. It constitutes the atmosphere that occupies the bubble space in rising bread. Carbon dioxide constitutes three parts in every ten thousand parts of the air we breathe. These three parts are what nature draws through the pores of the plant leaf, and there in nature's food laboratory under the influence of direct sunlight acting upon the chlorophyll of the plant leaf, we have plant fiber built up so that all food for the human family is really carbon dioxide combined with moisture and mineral salts within the plant leaf.

Not only does nature build up food products from carbon dioxide, but she protects them from air. The apple skin, the orange peel and the shell of the nut all protect food from the air. Heathization imitates nature in protecting bread, butter, ice cream and certain forms of beaten candies from the deterioration that arises by virtue of air being incorporated.

The Department of Agriculture early established that it was the 10 per cent of im-

prisoned air in butter that was the great cause of butter deterioration.

The food scientist Heath, of Chicago, devised means of conducting the manufacturing operation in an atmosphere of carbon dioxide, the same atmosphere which is bought by perhaps 100,000 fountains in the United States where carbonated beverages are dispensed.

Here are some of the advantages of Heathization over the ordinary methods of manufacturing in air:

1. Heathization intensifies the flavors, making a good ice cream taste better through the use of the process. It would also intensify any bad flavor. Thus, only the manufacturers of good ice cream can use this process.
2. While air destroys vitamins, Heathization preserves them. This has been proven by animal feeding tests.
3. While air fosters bacterial development in foods, Heathization has proven to be an inhibitor. In actual tests of our own ice cream, we find ten times as many bacteria in ice cream made in air than we have in Heathized ice cream made from the same mix.
4. Heathized ice cream is a much more sanitary product. This, of course, is perfectly obvious, inasmuch as impure bubbles of air are kept out.

Heathization, then, is the science of making cleaner, purer foods of better flavor, lower bacterial content and better nutritional value.

There is nothing that any ice cream manufacturer cannot imitate us in doing up to the actual freezing process, which in the instance of ordinary ice cream is done in air. At this point we part company with those manufacturers of ordinary ice cream inasmuch as we go to the expense of buying this pure, invigorating, natural food atmosphere at a great cost to us. We do this because we want the bubble portion of our ice cream to be pure and clean, just as we insist that our liquid mix in all its handling be protected by every scientific safeguard.—Advertisement.

The New Ucopco Trade-mark And What it Stands For

Ucopco Wheel

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

When filtered, the liquid Gelatine is hurried to these great wheels and after a single turn is dropped directly into barrels. Our patented process requires less than 5 minutes to dry Gelatine. The old tunnel drying process requires 16 to 48 hours.

Gelatine consuming industries have long been familiar with the UCOPCO Red Drum as it appeared in our advertising in the past. With the perfection of UCOPCO WHEEL DRIED GELATINE, it seems advisable to employ as a trade-mark a semblance

of the machine which has revolutionized gelatine making and so greatly improved the product. Let our new trade-mark, which appears on every barrel, be your guide in selecting gelatine. It stands for unparalleled purity and quality.

added to the mix before homogenization, although in no case was it impossible to get 100 per cent "swell."

Texture and Resistance.

As might be expected the solids contained in the egg yolk had a tendency to improve the texture of the ice cream and increase its resistance. The addition of the egg yolk seemed to be more beneficial in the case of the ice cream containing the smaller amount of milk solids. This was probably due to the fact that in the ice cream containing 22 and 24 per cent milk solids the proportional increase in solids was much lower than in the case of the ice cream containing 16 per cent milk solids.

THE addition of egg yolk usually caused the ice cream to have a slightly richer flavor. Here again the increase was most noticeable in the low testing mixes.

The yolks also added a pronounced "egg flavor" to the ice cream which was very displeasing when as much as eight ounces were used. The flavor could be readily detected even when the minimum amount of four ounces was added to the mix. Heating the yolk in the mix at 150 degrees F. for 15 to 20 minutes helped to eliminate a part of this flavor.

In order to get the opinion of a group of individuals relative to the flavor of ice cream containing powdered egg yolks, 67 different people were given three samples of the experimental ice cream to judge. The ice cream was all made from the same mix. One batch contained no yolk, another contained four ounces, while the third contained six ounces of the yolk. The summarized criticisms of this group of judges is as follows:

	Control	4 Oz. Per 50 Lb. Batch	6 Oz. Per 50 Lb. Batch
Number placing first...	24	21	21
Number placing second...	19	24	19
Number placing third...	19	17	26

Fifteen of those who preferred the ice cream with no yolk chose that with four ounces next. Five had no preference for either the control or that containing four ounces over that containing six ounces, while one person could see no difference in the three. These data seem to indicate that although the 67 judges varied considerably in their tastes, the tendency was for most of the people to prefer the ice cream containing the smaller amount or no egg yolk.

From the data obtained so far it might be concluded that there is some tendency for a small amount of egg yolk to improve the body of the ice cream and increase its richness. However, the ice cream manufacturer should not lose sight of the fact that the same thing can be accomplished by additional milk solids. The use of filler is justified only when it has food value and can be economically used without detracting from the quality of the ice cream.

Two revenue officers drove up to a farm house in the Kentucky mountains, and seeing a little boy standing out in front, said, "Son, where is your father?"

The boy replied, "He is over at the still."

The officers smiled and one of them said to the boy "I'll give you a dollar if you show us the way over there."

The boy replied, "All right, I'll do it for a dollar."

"Well, come on, show us where it is."

But the boy said, "Where is the dollar?"

"We'll give you the dollar when we come back."

The boy replied, "I don't reckon you-all is coming back."

FAR WESTERN MANUFACTURERS PLAN JOINT CONVENTION.

Arrangements Made for Pacific Slope's Greatest Ice Cream Gathering Next Winter.

Arrangements have been made for what is believed will be the greatest gathering of Western ice cream manufacturers ever held on the Pacific Coast. The decision has been reached to hold a joint convention of the Pacific Ice Cream Manufacturers' Association and the California & Southwestern States Ice Cream Manufacturers' Association at Oakland, Calif., on December 10, 11 and 12, 1924. This decision followed conferences and negotiations which have been in progress during the past few months.

An invitation for the Pacific Ice Cream Manufacturers' Association to hold its convention at Oakland was extended by the California & Southwestern States Ice Cream Manufacturers' Association, following the latter organization's convention at Catalina Island last January. At that time the California ice cream men accepted the invitation of the California Dairy Council to meet in connection with the Pacific Slope Dairy Show.

Other organizations to meet at the same time are the Supply Men of the Pacific Coast Ice Cream Industry, the Pacific Slope Dairy Show, the dairy councils of the Western states, and the dairy divisions of the agricultural colleges and agricultural departments of the Pacific Coast states.

Officials say this will be the first time that the cooperation of all the dairy forces on the Pacific Coast will have been brought together with one object—"the substantial and proper advancement of an industry which is coming to occupy an important place in the economic and agricultural development of this coast."

The ice cream convention program will be arranged jointly by the two ice cream associations. It is promised that it will be most constructive and educational. The subjects will cover the development of the ice cream industry of the Far West, which has made remarkable strides in recent years, and also will bear upon the ever-changing problems in manufacture, distribution and merchandising which confront the industry in that section.

An important feature of the convention will be a complete exhibit of ice cream manufacturing equipment and supplies to be conducted by the Supply Men of the Pacific Coast Ice Cream Industry. This exhibit, officials promise, will afford ice cream manufacturers an opportunity to inspect and compare, without loss of time, the newest and best in the way of machinery and materials which contribute to the successful operation of the modern ice cream factory.

The Pacific Slope Dairy Show is representative of the entire dairy industry of the coast. It will be held in Oakland, December 10 to 16 inclusive. Oakland was chosen because it is the most centrally located city having adequate facilities.

Edible Gelatine in Ice Cream

THOMAS B. DOWNEY, Ph. D.*

THIS paper is a presentation of newly acquired knowledge regarding "Edible Gelatine," with especial reference to the nutritive value in ice cream as influenced by the gelatine contained therein.

A discussion of the food value of ice cream, from the standpoint of the composition of the mix, is particularly opportune, because the public has become extremely interested in the dietetic value of various food products. People are diverging from the old custom of surfeiting themselves with heavy indigestible foods; they are now planning their daily diets in a systematic manner by the standards of the newer knowledge of nutrition. Therefore, it becomes increasingly necessary that the enterprising ice cream manufacturer have available for the public all facts regarding the nutritive characteristics of this product.

The National Dairy Council has presented to the public the results of dietetic studies on milk; and now milk is used liberally by all classes of people of all ages. Previously, the general public had considered milk as a food for babies only. While milk is not a perfect food it is perhaps the best single food, considering the well balanced proportions of proteins, carbohydrates, fats, mineral salts and vitamins which it contains.

In the past, the estimation of the food value of ice cream has been based solely on the content of milk sol-

* Industrial Fellow, Mellon Institute of Industrial Research, University of Pittsburgh, Pittsburgh, Pa. An address delivered before the National Association of Ice Cream Manufacturers, Cleveland, Ohio, October 22, 1923.

ids and sugar and little consideration has been given to the relatively small amount of gelatine present therein. That the influence of gelatine upon the food value of ice cream is exceedingly important has been proved by feeding experiments which have been conducted during the past year. It is important therefore to consider the chemical and physical behavior of gelatine in the ice cream mix, and to discuss the broad principles involved in the use of gelatine in food products.

The properties which make gelatine an efficient stabilizer are the ones which cause it to aid in the digestion and absorption of foods. These properties result from the colloidal character of gelatine and are shown in the emulsifying and stabilizing effects which it produces. In ice cream, gelatine forms a thin film about the small ice crystals produced during freezing and prevents their growth to larger sizes. That is, gelatine stabilizes or protects ice cream; the chemist therefore terms gelatine a "protective colloid."

A familiar example of the lack of protective colloid is found in the souring of milk. Bacteria change the milk sugar to lactic acid which coagulates the casein forming curds. When gelatine is present in milk the casein is "protected" and the addition of reasonable amounts of lactic acid does not coagulate the casein. The emulsifying action of gelatine can be illustrated by the shaking of a mixture of oil and water. Violent shaking may be resorted to, but the oil and water will separate from each other after standing. However, if an emulsifying agent is present, the oil is dispersed through the water in tiny globules and remains as such when shaking ceases. That is emulsifying agents, such as gelatine aid in the formation of emulsions by stabilizing them.

Thus when ice cream or milk without a stabilizer is taken into the stomach the casein is coagulated into more or less dense flocks or curds by the hydrochloric acid and rennin present in the gastric juice and the fat present in the emulsoid state, are carried down, to a large extent, by the casein.

Gelatine Acts as Protector.

Fats in these casein curds make them tough and leathery and difficult of digestion. Since these masses must be completely dissolved by the juices of the stomach and intestines before the body can absorb the food, large amounts of energy must be expended in the digestive processes. Otherwise much of the food eaten may pass unchanged through the intestines. However, where gelatine is present in ice cream it acts as a protector and renders the casein insensible to quantities of acid and rennin which would otherwise have caused dense curds.

On the other hand, the digestion of ice cream which contains gelatine is strikingly in contrast with the conditions described above. When ice cream containing gelatine passes into the stomach, curdling of the milk casein may be prevented entirely. If coagulation does take place, the flocks are loose and the digestive juices easily dissolve them. Furthermore, gelatine is a pepsinogenic substance, that is, one which increases the flow of gastric juice. When the food is passed from the stomach into the intestines, the gelatine remaining as such aids the pancreatic juices by keeping the fats in the finely divided emulsified condition. In the intestines the dig-

AMONG THE BRIGHTEST THINGS IN THE REVIEW ARE THE ADS—READ THEM.

tion of food is completed and the nutritive portions pass through the intestinal walls into the blood stream. Gelatine itself is easily digested and its nutritive value also is secured. It is at once apparent that ice cream containing gelatine is easily digested and readily assimilated.

The maximum food value has been secured by the body with a minimum expenditure of energy. Consequently, it is of interest to examine the data secured from the feeding experiments referred to above. It is believed that these data demonstrate that gelatine enhances the nutritive value of many foods, and particularly of dairy products and cereal grains.

The animals used in these experiments were albino rats. They are omnivorous, like humans, and experience has shown that the results of feeding experiments obtained with them are comparable with those observed with human beings. Furthermore, the albino rat lives only about three years and in a comparatively short time the investigator can form conclusions applicable to the life cycle.

In these experiments a litter of young animals were taken shortly after weaning. Half of the litter were placed on a ration containing gelatine, the other half on the same ration without gelatine. The animals were fed daily and were weighed each week. A record of the weight of food consumed was also kept.

(The speaker showed a number of growth curves and photographs of animals, and of hospital patients.)

Increases Milk's Nutritive Value.

These feeding tests have demonstrated that the addition of one per cent of gelatine to milk has increased the nutritive value of milk from twenty to twenty-five per cent. Gelatine has favorably influenced the ability

of the animals to reproduce and give milk to their young. The animals whose food contained gelatine were healthy after six months; the animals on milk alone were losing health and vigor.

Also, it is evident that the addition of one per cent of gelatine to a mixture of egg and milk has increased the nutritive value of this food combination. The animals on the food containing gelatine grew at a normal rate on a smaller consumption of food. In addition to this, these animals bore normal young, which in turn grew at a normal rate on the gelatine and milk and egg diet. The animals fed on milk and egg without gelatine consumed a larger amount of food for equivalent gains in weight and they did not raise healthy, normal young.

From these experiments, it is obvious that gelatine has increased the food value of milk and a combination of milk and egg to a remarkable degree.

Indeed, the results were of such significance that experiments were carried out in co-operation with a large hospital in Pittsburgh. In this hospital one per cent of gelatine was added to the milk formulas upon which certain infants, under one month old, were failing. These babies had been losing weight and vitality from 10 to fourteen days after birth, because of their inability to retain their milk food or to digest the little that was retained.

When one per cent of gelatine was added to the babies' milk food, they were able to digest it and regurgitation ceased, dense curds were no longer passed in the stools, and the infants returned to normal health and growth. It is thus apparent that gelatine rendered the milk food acceptable to infants which were in an exceedingly delicate condition with badly deranged digestive processes.

Demonstrate Value of Gelatine to Ice Cream.

These findings are of great importance to the ice cream manufacturer, as they demonstrate that the small amount of gelatine in ice cream is decidedly advantageous. There can be no doubt that gelatine in ice cream makes a product acceptable to children, hospital patients and adults with deranged digestion, who would otherwise have difficulty in securing the nutritive value contained therein.

It should not be assumed that the value of gelatine in the dietary is dependent entirely upon its action as a protective colloid and emulsifying agent. Gelatine is a protein food which supplements the protein deficiencies of many food combinations.

The proteins of many cereal grains do not supply adequate amounts of all the fundamental units (amino acids) which are essential for the normal development of animals. The data shown above demonstrate that gelatine supplies these protein deficiencies in bread and wheat products, rolled oats and pearled barley—cereal grains which are used extensively in the dietary. Gelatine is particularly rich in lysine, an amino acid intimately connected with growth stimulation. For this reason its incorporation in certain food combinations is highly desirable.

In the use of gelatine, the ice cream manufacturer is not employing an unknown food. Gelatine is used in many other food industries as well as in practically every course of the modern table. Approximately four million pounds of gelatine are used annually by the hospitals and housewives for making desserts, salads, cereals, soups, etc., while the confectionery and baking industries consume similar amounts in their many different products.

These facts show that gelatine as a food enjoys a wide popularity. The old misconception that gelatine did not impart additional food value to ice cream and that it might be considered as a filler or adulterant have been removed.

The position of gelatine in the ice cream industry is well established, as shown by theoretical deductions, by practical experience, by laboratory experimentation with

animals and by clinical evidence obtained in the hospital.

The great ambition of the ice cream industry is to raise ice cream from the dessert class to the position of an essential food. Naturally, this can only be accomplished by presenting the true food features of ice cream to the people. The fact that gelatine enhances the food value of ice cream is proving one of the important stepping stones in the accomplishment of this purpose.

Our Very
Modern 4-Acre
Home

A One-Day Visit to Detroit **Gives You Three Years' Experience In Iceless Cabinet Operation**

OUR splendid new 4-acre home is headquarters for information on every phase of the iceless cabinet situation. Our staff of ice cream, electrical, refrigerating and chemical engineers is unequaled in America. Their actual experience in the problems which you face, covers even more than three years.

You can freely have their advice on the following subjects:

- (a) Proper construction of iceless cabinets.
- (b) Tests an iceless cabinet must pass to prove itself.
- (c) Various plans of issuing them to retailers.
- (d) Establishment of proper iceless cabinet maintenance service.
- (e) Operating expense of iceless cabinets.

- (f) Adaptation of routes, vehicles, man power, etc.
- (g) Effect of iceless cabinets on distribution costs.
- (h) Our deferred payment plan of purchasing iceless cabinets.

These points and many others can be discussed with you here, not on the basis of theory, but on the basis of our unprecedented experience and remarkable mass of data.

In addition you can inspect over seven hundred actual Nizer installations in Detroit—and hundreds of others in nearby towns and cities.

Come to Detroit now. It will pay you well. You can gain three years' experience in a day—and be under no obligation to us. You owe it to yourself and your Company to make a thorough investigation of the iceless cabinet proposition.

Nizer Corporation

7424 Mackie Avenue, Detroit, Michigan

NATIONAL CONVENTION—NEW ORLEANS—NOVEMBER 17-20, 1924.

Proceedings of the Wisconsin Convention

(Continued from March issue)

F. B. Riley of the Detroit Creamery, Detroit, Mich., delivered an interesting discussion of mechanically refrigerated ice cream cabinets. Mr. Riley's paper will be published in a later issue of *The Ice Cream Review*.

Mr. Klueter: Pasteurization as a safeguard to public health. It is to be understood that the material presented is to serve as a basis for discussion only and is not at this time to be taken as indicating the position of the dairy and food department with respect to the passage of legislation pertaining to pasteurization of all dairy products used in ice cream, or perhaps requiring the pasteurization of the mix before freezing.

There has been considerable work done on the subject of bacteriology of ice cream. At a hearing before Dr. C. L. Alsberg, chief of the bureau of chemistry, U. S. Department of Agriculture, very comprehensive reports on the subject were presented by Prof. John Gordon, Prof. Samuel G. Prescott, Dr. F. G. Heinemann and Dr. Hubert D. Pease, and at about the same time, Dr. W. B. Hammer of Iowa completed and published his work on bacteria in ice cream. A. C. Baer, of the University of Wisconsin in 1916 published a bulletin on ice cream making. This latter work deals more largely with chemical work but will be of some assistance in considering our subject.

No doubt, most of you are familiar with the fact that there is a law in Wisconsin requiring the pasteur-

ization of skim milk, butter milk and whey produced and distributed as a food for men or domestic animals. This provision of law may have suggested to some of you the advisability of considering pasteurization in connection with ice cream. I do not feel it necessary at this time to go into the merits of the law. This matter has been before the public of this state for at least three years. It has been presented at two sessions of the legislature and was sponsored by those interested in preventing the spread of bovine tuberculosis. From what I have been able to learn about the spread of this disease I feel that the present law is justifiable as a preventative measure. The passage of this law was not sponsored by the dairy and food department but was put into that department for enforcement.

This brings us now to a consideration of the passage of legislation concerning the pasteurization of all dairy products used in ice cream or of the mix. As one engaged in the enforcement of law, naturally the first question that presents itself to me is: Is there an evil to be corrected? At the present time I do feel myself qualified to answer this question in the affirmative and furnish the necessary proof to support such an answer. This question is brought out as being of fundamental importance in attempting legislation and therefore should be carefully and thoroughly considered. In the passage of the present law requiring pasteurization of by-products there was abundant evidence of an evil to be corrected.

Searching for a plausible cause for legislation requiring pasteurization I find Dr. Hammer makes the following statement:

"While the number of outbreaks of disease traced to infected ice cream is small, when compared to the number traced to milk, it is large enough to have attracted the attention of those interested in the public health." Newman (1904) says, "Some dozen outbreaks of disease have been attributed to the consumption of ice cream," and then he mentions specifically three outbreaks of typhoid and one epidemic in which the symptoms were concluded to be characteristic of poisoning through foods. Chapin (1910) writes as follows: "Sedgwick and Winslow collected records of four outbreaks of typhoid fever due to the use of ice cream and another has been reported by Barras."

An idea of the relative importance of infected ice cream as a cause of typhoid fever may be obtained from Trasks compilation: "Out of 179 epidemics of the disease reported as spread by milk, ice cream was given as the infective medium in three. Buchanan (1910) a list of English epidemics traced to infected ice cream, reviews four outbreaks of typhoid fever, one of scarlet fever, one of diarrhoea, and three of ice cream poisoning."

I HAVE been unable to find so far any recorded report claiming to have proof of the transmission of bovine tuberculosis to human beings through ice cream. It is, however, admitted that bovine tuberculosis is transmissible. Knowing as we do from thousands of experiments that milk and cream are ideal products for a rapid and luxuriant growth of bacteria and that there are instances in which it is claimed there is indisputable evidence that the disease has been transmitted to uninfected herds of cattle and other farm animals, through

Several Thousand Doors Waiting!

AS a matter of **service**, and as a measure of "preparedness," our stock-room is constantly maintained with the maximum number of Jamison Type Cold Storage Doors ready for immediate shipment.

Suppose you were in a hurry for Doors. Suppose it were absolutely necessary that old doors be replaced with new ones quickly. Suppose it were necessary that doors be obtained immediately for installation in an addition to your plant.

These suppositions often become **facts**—and especially so at this season of the year. With the coming of Spring, comes the yearly "clean up, fix up" period—a time when the plant is usually gone over from front to back—from top to bottom—making repairs where ever necessary in order to maintain peak efficiency.

Cold storage doors, especially, are subjected to unusually heavy wear—and, while they sometimes can easily be repaired, in the majority of the cases it is more logical to replace them completely.

It is for just such necessary emergencies that we maintain this large stock of standard sizes of Jamison Doors. They are waiting here for you—ready to be shipped out the day your order is received. This saves time—several weeks time! And where is it that time doesn't mean money?

As part of this "Stock for Immediate Shipment" service, we issue weekly a Stock Sheet showing the sizes and number of doors in stock each week. This will prove invaluable and we suggest that you allow us to put you on our list to receive it regularly.

If you haven't received our new catalogue No. 11, write for it. You will find it the most interesting 74 pages of cold storage door information you have ever read, with reproductions of doors, blue-prints of construction details and tables telling door numbers in stock and their dimensions. You will want this as a guide in ordering the necessary doors during your repair season. Address Desk No. 6, please.

Hagerstown, Md., U. S. A.

Jamison Doors
*for better
refrigeration*

skim milk, butter milk and whey, it would seem some action seems justifiable. The lack of positive evidence of transmission of the disease to human beings may well be due to the character of the disease. Tuberculosis is not a disease like typhoid, scarlet fever, and septic sore throats that break out in the epidemic form, hence is not so easily traceable to its source. It is slower in development and so, especially because of a longer time between infection and the appearance of the disease than is the case with the other diseases, there is less possibility of fixing the source.

LET us now take up some of the benefits to be derived by the industry from a pasteurization law. That public confidence would be instilled in the industry and

its product ice cream, I believe is beyond successful contradiction. Let me pause here just a moment to remind some of you that though but a few years ago you would have it that ice cream was only a dessert and not a food, it is today accepted as one of the nation's most important foods.

The benefits to the quality of ice cream from pasteurization are of importance. I speak now of proper pasteurization followed by rapid cooling and proper storage; and especially of proper raw materials for pasteurization and subsequent manufacture. Let no one be deceived into believing that pasteurization may or should be used as a renovating process. Its legitimate use is the destruction of pathogenic or disease producing bacteria and as an aid in improving the keeping qualities of good clean raw materials for future use.

Any other use than those mentioned would certainly prove a positive injury to the industry. It is well known that bacteria thrive in both milk and cream, so also do yeast, and that undesirable flavors develop where their growth is not checked and controlled. All of you know from experience that fresh cream should be properly aged or matured and here is where pasteurization of fresh clean cream and milk may be used to advantage. Unpasteurized cream, as thousands of experiments show, is very high in bacterial count. Records of bacteriological work on cream show bacterial counts as high as several hundred million per cubic centimeter. Such cream, in my opinion, is unfit for use in ice cream but had such cream been properly pasteurized while fresh it might have been of excellent quality.

THE claim has been made by some that pasteurized cream does not produce an ice cream of as good body and texture as does the unpasteurized cream. This claim has been entirely disproved by the work of Baer at the University of Wisconsin and others. In fact, as I have pointed out, pasteurization of clean raw materials, milk and cream, make possible proper ripening and maturing of cream.

It has been the belief of some that cold and especially the temperatures of the hardening room kill bacteria. This belief has been disproven by scientific investigation. It is true that bacteria growth is inhibited and retarded by cold but not destroyed. I think the results of some of the bacterial work on ice cream might be of interest and benefit and I will present some of the data.

Grades and Strength

CRYSTAL Edible Gelatine is graded and priced strictly according to jelly strength, the only true indicator of the stabilizing and water absorption value of gelatine — especially in ice cream.

Buy A 300 Special

for these reasons:

1. A better product can be produced in a 300 Special. This bold statement has been proven in scores of dairies.
2. Sanitation is possible only by cleaning equipment and keeping it clean. This unit has no coils or other cumbersome parts on the inside, and this, coupled with the character of the surface of Elyria glass-enamel and the construction of openings, makes it a truly "sanitary" vat.
3. Simple construction means lower maintenance costs. The only moving part is the small impeller agitator.
4. Less floor space is required. The 300 Special occupies only about one-half as much room as a coil vat of equal capacity.
5. Economical operation results from few repairs and a saving of labor and fuel.
6. Insulation is an Elyria feature worthy of consideration, both with regard to efficiency in heating and the preservation of the outside paint. Operating conditions in the pasteurizing room are greatly improved because of less heat radiation.
7. Standard interchangeable accessories are now found on all Elyria units. The advantages are apparent. Motor and pulley drives are interchangeable.
8. Durability is to be looked for in all equipment. You will find the 300 Special will become a permanent addition to your plant.
9. Lower prices, obtained through standard design and quantity production, place this unit well within the reach of any plant owner.
10. Immediate shipment can be made from a large stock of machines equipped with either motor or belt drive and with angle stem or recording thermometer.

Write today for complete information and prices!

Texas Convention Proceedings

(Continued)

Vice-President Mathewson: Professor A. C. Baer of the Oklahoma Agricultural College will now give us a talk on ice cream. I am sure you will all be glad to hear what Mr. Baer has to say.

* * *

THE ICE CREAM INDUSTRY OF OKLAHOMA.

By Professor A. C. Baer.

IT IS always a pleasure for me to meet with the ice cream manufacturers of Texas. I am glad to be with you today.

For the last two years I have not been as close to the ice cream manufacturing industry as I should have been. Our dairy husbandry department at the college has been enlarged, and this has taken up a great deal of the time which otherwise would have been devoted to the manufacture of dairy products.

The past year the ice cream industry has made its usual progress. I have seen figures showing that the ice cream production now is greater than it ever was before. In the southern half of the United States the production has increased about twenty per cent. This is at it should be, for the consumption of ice cream has not been as great in the South as it should be, in proportion to the consumption in the North. In the North, the consumption of ice cream has been above that of the country as a whole. Cincinnati, for instance, was said a few years ago to have the greatest per capita consumption of ice cream. We hear of other cities

claiming the greatest per capita consumption, especially in the North, and the time has come when the South with its warmer climate should have the largest per capita consumption of this product.

The increase over the entire United States is reported at about ten per cent. No doubt the dry law has had a great deal to do with the increase in demand. Carbohydrates formerly taken from the glass are now taken from a dish or an ice cream cone. People who formerly depended upon the brewers and distillers to furnish refreshment, are now looking to the ice cream manufacturer for it. The candy man has also received his share of the business which formerly went to the brewer, as evidenced by the increase in the consumption of candies.

Throughout the entire world we find the ice cream manufacturing business is increasing. In England, for example, the demand for ice cream has increased about 75 per cent in the past two years. Large, modern plants are being constructed in England, some of them with a capacity of over 1,000 gallons of ice cream a day. Ice cream was little known in the countries of Europe before the war, but the production of it was stimulated by the American soldiers who demanded real ice cream instead of the "cream ice" formerly made in Europe, until now the European manufacturers are abandoning their old name of cream ice and adopting the American name, ice cream.

Australia, known throughout the world as a great butter producing country, is becoming a large producer of ice cream. It is also spreading to South Africa. Just a short time ago I had a letter from a former student who is working for a company operating in South Africa, and he said his company plans to establish a modern plant there, and he wanted me to send some good boys down there to help him. A couple of them decided to go, and were going to send a wire stating they would come, but found it would cost the \$2.83 a word to send a cablegram, so they concluded it would be best to write instead. A young Japanese who attended the University of Wisconsin is now operating the largest ice cream plant in Japan.

Ice Cream Development Is World Wide.

So we find the ice cream business growing rapidly over the entire world. The foreign countries are depending upon America to furnish the ideas, as well as the equipment and much of the supplies for their new industry, and we will have a tremendous influence upon the manufacture of ice cream and other dairy products in the old world.

Some foreign countries are 2,000 years behind times in the handling of dairy products, while others, like Australia and New Zealand, are advanced as far, if not farther than this country in the making of butter. We do not think of Australia and New Zealand as great dairy countries, but it is a fact that butter is being produced there on a more intensive scale than it is here in America. New Zealand is especially noted for its dairy industry. New Zealand farmers use more milking machines in proportion to the number of cows than we do in this country.

However, I would build my talk to you this morning around the quality of ice cream. Quality is a word that may mean little, or it may mean much. To you it should mean much, for a uniform high quality of ice cream is what you all should produce. The ice cream of

South is not what it should be. We are criticized by men of the North for making a poor quality product. They tell us that our cream in the South is not fit to eat. This, of course, is not true, but we should be making a product that is beyond reproach, and one that will stand the test of time.

One reason for our not making the quality of ice cream we should have is that throughout the South it is not realized that competition and quality and price are big factors in the business. When competition makes it necessary to use lower quality raw materials, the best uniform quality cannot be maintained.

Ice cream of the South ought to be of more uniform good quality. We could gather samples of ice cream made in 100 different cities, and find no two samples alike. We would have a great variety of flavors, color and texture. We would have a hundred samples of vanilla ice cream with as many different flavors of vanilla. If we could get the vanilla manufacturers to make a standard vanilla flavoring, we could get uniformity on that point. If the gelatine we use were uniform in quality, our ice cream would be uniform in stability, and if our raw materials were uniform in flavor and quality, we would have greater uniformity in flavor and quality of the ice cream. A hundred different ice cream makers may have a hundred different ideas about making the ice cream, another factor in our lack of uniformity.

We cannot, however, expect to attain uniformity in the manufacture of ice cream as we have reached in the making of butter and cheese. The making of butter and cheese is a simpler process, fewer ingredients enter into its manufacture, and uniformity can therefore be reached to a very high degree.

The question might be asked as to why ice cream should be uniform in quality. Some of you may say you do not want your ice cream to be like your competitor's, for you want to build up the demand for your own particular kind of ice cream. You may want to have a great difference in flavor, texture, etc., in order that the people of your community will recognize your own ice cream when they taste it. Ice cream is becoming known throughout the entire world, and in order to make it just as popular as possible among the people it should be of the highest quality and uniformity it is possible to maintain. People living in one city should be able to obtain ice cream in another city of just as uniform good quality as they can find at home. They should find the same quality in one state as in another and the same quality in the old world as in the new and by thus cultivating the desire of the people for a uniform good quality of ice cream, the maximum per capita consumption throughout the entire world can be obtained.

The best and most uniform quality of ice cream can be made when fresh raw materials are available and you ice cream manufacturers should encourage the production of milk in your communities by using just as much of the surplus during the summer months as you possibly can. You help yourself to make a high quality of ice cream, and you lay the foundation for better quality for the years to come. Good raw materials are to a great extent responsible for the high quality of ice cream made in Milwaukee. Ice cream manufacturers in that city have available the best quality of fresh raw materials. There are big dairy herds under the care of farmers who make a specialty of producing good quality milk, farmers who know how to produce milk of good flavor, and take proper care of it till it is delivered to the manufacturer.

Of course, the raw milk must be purchasable at a reasonable figure, and the ice cream manufacturer can

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

not compete with the milk dealer at present prices of finished dairy products, and pay for raw milk the same price as the milk dealer pays. Yet, the milk dealer cannot profitably use all the surplus during the summer months, which should be available to ice cream men at a figure they can afford to pay for it. Usually this surplus milk can be purchased for less money during the flush season.

About sixty per cent of the ice cream made in this section is a reconstructed product, and chiefly because of the scarcity and higher price of raw materials. Production of milk here should be encouraged at all times, in order that the best quality of ice cream may be made. Farmers get discouraged, and justly so, when they must sell the product of their cows for sour cream prices. There isn't enough money in dairying that way to justify their increasing and improving their herds, unless a fluid milk market is provided for them.

There has been quite a bit of agitation along this line in Oklahoma recently, and we have been criticized for not making a market for whole milk in Oklahoma. This is quite a problem, and I have given considerable thought to it. Cheese factories have been suggested as a partial solution, but we would then have to solve the problem of curing and marketing the cheese. In this country it would be necessary to provide refrigerating for the cheese curing rooms, which would be very expensive, and would make it impractical to establish cheese factories. The best solution of the cheese factory problem that I have found is to establish cheese factories to take care of the fluid milk, and have a central curing plant, to which the little factories could ship their cheese every day or two, thereby doing away with the need of expensive equipment for refrigeration.

Before we establish cheese factories in Oklahoma, however, we must look around for a market for our cheese, and we must educate the farmer to produce a better quality of milk. Milk of the highest quality is needed to manufacture a good uniform quality of cheese. The farmer must take care of the milk, cows' udders must be cleaned before milking, the farmer must learn to use plenty of hot water for the cleaning and sterilizing of pails, cans, coolers and other utensils. The farmer must also learn the necessity of proper feeding. I saw cows last May that were being milked, and I wondered how they could give milk at all, they were so thin. They were of the good dairy type, the type that will milk off every ounce of flesh they can spare, but the best of dairy cattle will not yield the farmer a living wage and profit unless they are properly fed.

And in order to produce the best quality of ice cream, we must have the good quality milk that I have just been talking about. The milk must be handled in the most sanitary manner possible, and ice cream manufacturers should try to get this whole milk. It should not be necessary to use cheaper ingredients in the manufacture of ice cream. I would rather see the ice cream manufacturer use a good quality of ingredients and charge \$1.50 for his ice cream, than to use poorer quality products and sell it for 90 cents. I know of ice cream factories that have built up a wonderful business on quality alone, and they charged from ten to twenty-five cents a gallon more. The people appreciate quality. I will believe that ten per cent of butterfat is sufficient for our ice cream, but there are many factories making cream of a much higher fat content, making big sales, and getting a good price for it. Some factories in the East are making a 20 per cent butterfat product, and have built up a wonderful business for this quality of cream.

The chief point in favor of the ten per cent ice cream is that it is a more nearly balanced food product. I do not mean that it is a better quality product so far as

1—Pen Pressure and Position Adjustments

2—Fountain Pen Point

3—Fixed Pivot

4—One Size Chart

5—One Turn Chart Holder

6—Improved Case

Inside the case you will find the reason for the extraordinary ruggedness and accuracy of TAG Recorders. By reason of a patented cam arrangement, the TAG is the ONLY Recorder with uniform chart graduations for ALL ranges. A special seasoning process prevents "setting" of the spiral spring. The development of a single-piece welded bulb and of a capillary tube of exceptionally fine bore are other TAG achievements. The following distinctive structural features also contribute to TAG superiority.

1—Pen pressure adjustment and pen position adjustment, the latter providing an exact and convenient means for correcting accidental bending of pen arm.

2—Fountain pen point writes a clean sharp record line and requires less frequent filling. The non-corrodible pen arm is inverted so that ink cannot run down into operating mechanism.

3—Accuracy of time indications is assured by mounting pen arm on a FIXED pivot so that pen point will always follow radial lines of chart (with clock stopped). Positive pen-arm stops, specially designed clock, convenient clock starter-lever are other features.

4—By standardizing on one best size of chart, manufacturing costs have been reduced making possible unusual refinement of construction at the usual price.

5—Improved chart holder, secured to case by light chain, is attached and removed with a single turn. Charts are printed in green ink on specially seasoned high quality ledger paper.

6—Improved case construction incorporating moisture-proof feature, if desired.

TAG DIAL-INDICATING Thermometers embody the same improved construction and operate according to the same reliable principles as TAG Recorders. The exceptionally easy reading dial is a feature.

the ingredients are concerned, but it more nearly meets the demands of the human body for fats, sugars, and minerals.

There are many other things I could talk about in connection with ice cream, but they are old subjects. We have been discussing overruns, temperatures, acidity, and these problems are not solved by any means, but I haven't anything new to present to you along this line just now. No one knows all about overrun. For instance, just a short time ago I had a letter from a man up North who said he couldn't keep his overrun down below 150 to 160 per cent. He explained his procedure to me thoroughly, and I suggested to him that he weigh a quart of his mix, and then weight a quart of his ice cream, and see if his calculation of overrun was OK. He wrote back that his first figures were a mistake, and that some adjustments had to be made on his overrun tester.

Only a few years or so ago we thought it was necessary to develop acid in the mix in order to obtain the necessary viscosity of the mix, but experiments have proved that this belief was unfounded. It is not necessary to develop acid in your mix in order to obtain a good overrun. We have found that ageing the mix without acidity produces a better overrun than aging the mix with a high acidity. The low acid mix will retain the air much better. I was quite sure of this as far back as 12 years ago, and experiments since that time have proved the theory to be correct. If any of you would like to experiment along this line yourselves, take five samples of cream each one, two, three, four, and five days old, in which the acidity has had an opportunity to develop slightly, and you will find that the low acidity cream will whip much easier than the others. If you have any doubts, it is an easy matter to take a few

samples and try it yourself. A year ago last summer I made more than one hundred of these tests, and found that high overrun was obtained from a mix with a low acidity, and that it is not the acidity, but the longer ageing that gives the mix its property to retain air.

The amount of gelatine, the quality of gelatine, and the method of adding it to the mix also have some influence on the overrun, which also makes the overrun harder to control. In this state the overrun is not of so much consequence, but in the state of Kansas they have a law which requires that ice cream must weigh 4.75 pounds per gallon. Ice cream factories in Kansas cannot comply with the law, for the overrun is too difficult to control. One can of ice cream may weigh 4.6 pounds to the gallon, and the other 4.9 pounds, and it may have been made in the same factory, under identical conditions, and from the same batch of mix.

Another question is sanitation. It would do no good to pasteurize the mix and use the best of methods if the mix is allowed to become recontaminated after pasteurization. Extreme cleanliness must be practiced, in order to hinder as much as possible the growth of bacteria. There has been no definite standard for the bacterial count in ice cream fixed, but the American Dairy Science Association is about to agree on a content of 20,000 per cubic centimeter. This count, of course would be approximate, for it is impossible under present methods to count the bacteria accurately. In most factories it would be impossible always to produce ice cream with a bacterial content of less than 20,000, but the monthly average should be less than that. It would mean that a man could not have a count one day of 20,000,000, and 10,000 the remainder of the month, for his average would be many thousands above the standard.

The bacterial count of ice cream is of much value being not only a check that the manager can have on the ice cream making processes, but it shows him how his employees are handling his product from the sanitary point of view, and gives him a good idea of the quality of raw materials he is using. In 98 per cent of the cases the milk from unclean cows produces a bad flavor in the ice cream, and the bacterial count is a most effective means for its detection. A bacteriological test provides a check on the cleanliness of utensils on the farms and the ice cream factory. Utensils must not only appear clean, but they must be bacteriologically clean, in order to produce an ice cream with a low bacterial count. This point cannot be too strongly impressed in the minds of the help in the ice cream factory, for it is one point that can be made to produce or to fail to produce a high quality product.

Pasteurization Is Essential.

Pasteurization of dairy products is so essential that we have laws requiring it, but the public do not know that pasteurization is absolutely necessary in order to provide absolutely safe butter, market milk or ice cream. Even some of our physicians do not know, and do not believe that dairy products should be pasteurized. I can give you an example of this from my own personal experience. An athlete at the university was talking to a physician, and remarked that he was drinking lots of pasteurized milk. The physician told him to quit and drink raw milk instead, for the pasteurized milk did not have a single vitamin left in it. The student asked me what I knew about it, and I told him that the statement was absolutely untrue, and to tell that doctor he hasn't read anything in the last ten years. E. McCollum, discoverer of vitamins says, that if all vitamins at all are destroyed in the process of pasteurization of milk, one-quarter of a teaspoonful of orange juice a day would furnish the body with all the vitamins lost through the pasteurization of the milk.

THIS Tall Tub

has been the first choice of discriminating ice cream manufacturers ever since it was introduced. They will buy no other, for this tub is backed by a three year guarantee. Let us tell you more about it.

Below is the new-style Ice Cream Cabinet we are now manufacturing. It is a vast improvement over the old-style box cabinets. It is equipped with cut steel

WHO USES THE "PFAUDLERETTE"?

THE surest test of the success of a new unit is to be found in the rapidity with which it is adopted by the trade. On top of this is the calibre of the users. Our sale of the "Pfaudlerette" has never been larger than it is now. (Production for both February and March was double that of January.)

Here are some of the buyers of "Pfaudlerettes" during the last 60 days:

—buys the "Pfaudlerette," a complete 300 gallon glass lined pasteurizing unit. You need not buy extras. It is ready to install.

Specifications include:

Tank complete (shell of 5/16" steel) glass lined.

Equipped with:

Standard Spray Coil and Brine Strainer.
Sarco Steam Trap
Standard Flush Valve
Angle Stem Thermometer (recorder may be had at extra cost)
Vacuum and Pressure Gauge
Pop valve
Pressure Regulator
Impeller Agitator with tight and loose pulleys
Conical Copper-tinned Cover
Standard lugs and pipe legs

Check on the coupon below the operation in which you are interested. Details will be sent without obligation.

AMONG THE BRIGHTEST THINGS IN THE REVIEW ARE THE ADS—READ THEM.

It might be interesting for you to know that since I began answering inquiries through The Ice Cream Review five years ago, I have received 1,979 letters from ice cream factories regarding their methods of making ice cream, and that 42 per cent of them have come from the southern half of the United States. They have come from every state in the Union except four, and twelve per cent came from Wisconsin. Inquiries also came from eight foreign countries. The general type of inquiry is about the same as five years ago, indicating that new factories are being established and that our experience up to five years ago is not quite so generally understood as we might suppose.

* * *

Vice-President Mathewson: If there are any questions any of you would like to ask Professor Baer I hope you will take advantage of the opportunity you now have.

Mr. White: Some time ago we solicited the support of the food and drug department at Austin to get our pasteurization law and we found that the dairy commissioner was against it. The commissioner was supposed to be with us here at the convention and give us a talk but he has failed to arrive. We would like to have him here today to debate with Prof. Baer the question of pasteurization. We hope to be able to have him on our program the next meeting and if we can, we will have Professor Baer come down again and raise the question of pasteurization on the floor.

Prof. Baer: If you wish to have me debate with the commissioner in regard to pasteurization, I would like to have you advise me a few days in advance as I have a couple of trunks full of medical journals and pro-

fessional papers that I would like to bring with me. It seems that the health authorities are not keeping up with the latest developments. If pasteurization of milk kills the vitamins in milk, why is it that people in Chicago, New York, Philadelphia and other cities where pasteurization has been enforced for several years, do not die by the thousands. Surely people in these cities are just as healthy, if not more healthy than they are in cities where pasteurization has not been required. I do not understand why men in charge of the health department of the states and cities should insist that raw milk is just as good as pasteurized milk as a food.

Mr. Boedeker: Which do you consider best, 10 or 12 per cent serum solids?

Prof. Baer: Not over 10 per cent. If serum solids are nice and fresh it is all right to put in 12 but if you put in over 12 you are passing the danger point and are liable to have sandy ice cream.

* * *

Vice-President Mathewson: We are going to have talk now from Mr. Boedeker on ice cream cabinet. Mr. Boedeker has devoted considerable time and study to the iceless ice cream cabinet and I am sure you will get a great deal of information from him. He is going to talk to you from the standpoint and viewpoint of the large manufacturer who has considerable delivery expense.

(To be continued next month)

DISTRICT MEETINGS PROVING POPULAR.

(Continued from page 25)

Canton—B. A. Milliken of Youngstown, chairman, and E. H. Campbell of Salem, vice-chairman.

Zanesville—John Hemmer, chairman, and H. S. Dassel, vice-chairman.

Athens—J. J. Schmidt of Athens, chairman, and E. Cox of Portsmouth, vice-chairman.

Toledo—R. L. Graham of Lima, chairman, and W. Gleason of Bryan, vice-chairman.

Dayton—L. E. Ellis, chairman, and P. E. Benne, vice-chairman, both of Dayton.

Cincinnati—W. C. Shorb of Cincinnati, chairman, and Frank French, Cincinnati, vice-chairman.

Columbus—L. F. Monte, Marion, chairman, and M. Jewell of Mt. Vernon, vice-chairman.

DISTRICT meetings were held in Kansas in February at Grand Bend, Wichita, Cherryvale, Concord, Topeka and Manhattan, with a scoring contest at the last named place.

The North Carolina association likes the idea of holding district conferences. The Georgia association holds four a year. The manufacturers of the mountain states, where no association exists, hold conferences of this kind once in a while, as also the manufacturers of the Pacific Northwest.

VIKING—The Practical Pump

For pump users who demand dependability and economy of operation.

The VIKING is self-priming and delivers a steady stream under varying heads. This eliminates all splashing and pounding.

Only two moving parts—no valves, springs or other trouble-makers.

A Bold Sweeping Offer

WOULD you like to receive an assorted dozen No. 10 cans of our ice cream fruits and flavors that are new to you?

A few of these products are listed in the coupon below. Have you ever tried Toasted Nut Paste, Butter Scotch, Black Walnut, Fig Walnut, Harvest-Moon Special and other items?

These flavors are being used by ice cream companies in all parts of the country. They are not experimental in any sense, but they may be new to you.

Here is our bold, sweeping introductory offer. Make up an assortment of one dozen No. 10 cans from the list in the coupon. If any item is unsatisfactory, you need not pay for that item. Deduct it from the invoice and remit only for those items that are satisfactory.

Fair enough? Then check your assortment in the coupon and mail it to us.

The Cleveland Fruit Juice Co.
Cleveland, Ohio

Manufacturers also of the celebrated Honeymoon Special, Maple Concrete, Black Walnut, Egg-Nog and many other flavors. Write us for complete list.

Mail Coupon to **THE CLEVELAND FRUIT JUICE COMPANY, Cleveland, Ohio.**

Proceedings of the Ohio Convention

(Continued from March issue)

PROFESSOR Stoltz briefly outlined the work of the College of Agriculture, and especially those branches that have to do most with the dairy interests. The university has furnished men now employed in some of the most progressive ice cream plants in Ohio, and practically all other states. Men produced by the college are equipped not only to perform duties in the laboratories, but they are furnished with the fundamentals in business necessary for the development of a department or plant manager or an executive. Professor Stoltz cautioned the ice cream manufacturers against expecting a man fresh from college to immediately become proficient in plant operation. He says these men may not be better managers than non-college men when they begin their work, but their college training helps them to develop more rapidly, and to grasp and handle situations to better advantage.

The college has done little experimental work in ice cream recently. An investigation was conducted with the view of determining the number of profitable and unprofitable stops served by different ice cream manufacturers. Seventeen factories, representing 750,000 gallons of the icecream sold in Ohio during August, 1923, reported. The following table shows the result of the investigation.

Gallons of ice cream served per customer	Number of stops	Gallons of ice cream served each (average)	Per cent of total sales
120—or more	1937	241	69.3
90—120	623	101.95	9.4
60—90	937	73.44	10.2
Less than 60	1951	37.76	10.7

One company had over 90 per cent of their sales fall into the first class. Another had less than two per cent fall into the fourth class.

Professor Stoltz urged the elimination of the unprofitable stops. These usually demand at least three kinds of cream, which remains unsold so long it is no credit to the ice cream manufacturer when it does finally reach the consumer. One manufacturer offered the opinion that he could afford to have the small dealer come to his plant for his cream and give it to him absolutely free of charge and he would not lose any more in that way than he does at the present time making free deliveries, and giving free service.

The address of Dr. Luther P. Howell on "Ice Cream as an Essential Factor in Infant's Feeding" will be published in an early issue.

Concluding the program of Thursday afternoon was the address of E. Elmo Martin of Cleveland on "Just Business." It is Mr. Martin's business to lead the Elmo Martin Service, Bulkley Building, Cleveland, advisors with executives in sales costs and sales analyses, training of department heads and executives, etc. His talk was chiefly on the executive, and his duties as a leader of a teacher to delegate authority to carry out his wishes to subordinates. He is a firm believer in placing responsibility with authority upon employees, and the use of the kind word of appreciation instead of the harsh word of reprimand.

Hon. Arthur McWilliams, Dairy and Food Commissioner of Ohio, was called upon to discuss, "The Application of the Ice Cream Law."

"The question of sanitation in ice cream manufacturing plants has assumed the status which has revolutionized most of our food industries within the past few years. The public is taking a decided interest in places and methods used in the production of articles offered for their consumption. This trend towards cleanliness and inviting appearance is forcing a general remodeling of food distributing establishments, influenced by daily personal contact with the public and gradually and surely extending to the sources of production.

"The grocery store, of our younger days, with its absorbent sawdust covered floor and open display containers, inviting contamination, is a thing of the past, and the ice cream plant in the dark, musty cellar with an atmosphere of sewer gas must pass with it.

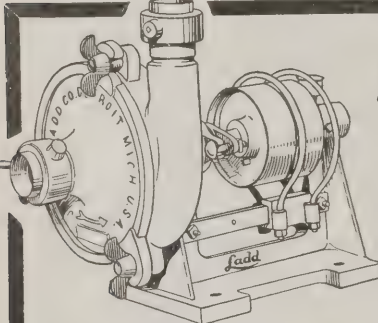

"As the index tells us the contents of a book even does the outward appearance of your factory serve as a guide to quality and purity of your product.

"The manufacturer should guard himself against indifference to public inspection and not content himself with the thought that taste is all the consumer seriously considers and that he is not solicitous of the sanitary conditions attending the production of his food.

"Many fail to understand the true importance of a well appointed shop as an advertising factor, especially when located so as to come under the daily observation of the general public; in fact the appearance of the establishment expresses the character of the operator. There is no substitute for this form of advertising: newspapers, novelties, carders, etc., are secondary, and once the word 'unclean' is broadcasted predicated your place of business, its significance in the present commercial life is much the same as in the social life of Jerusalem hundreds of years ago.

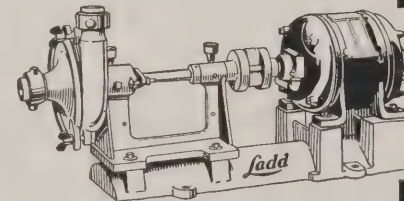

"True more capital becomes involved in elaborating establishments, but a more stable and profitable business usually follows. Expensive equipment is not always necessary to produce a sanitary article, but insufficient installation is extravagant and decidedly poor business policy. Frequent painting is a commendable practice and goes far in imparting a clean, fresh, pleasing appearance, besides paint is antiseptic in properties and one of the best sanitary agents known.

"Proper ventilation—a circulating atmosphere of the highest purity attainable is a very important factor in ice cream production.

sider as the finished product is about 50 per cent air. Sunshine is not only preferable for light, but as you are well aware of the most potent natural bacteria destroyer. Natural light, ventilation, drainage and paint may be considered the cardinal points in construction of a factory.

"The main source of contamination is the returned empty can and a thorough sterilization and cleansing is absolutely necessary, especially, when customers disregard rule 113 of our sanitary code which provides 'they shall be cleansed as soon as emptied to prevent development of dangerous bacteria.'

"To maintain a plant in proper sanitary condition requires daily attention, as a matter of protection both to the consumer and yourself, as communication of disease through carelessness or neglect in this respect would entail commercial hardship. Also, we still hear an echo of the disaster suffered by the olive industry a few years ago due to botulinous development caused by improper processing.

"Ice cream has become a household necessity as evidenced by the marvelous increase in consumption within the past decade. The average annual expenditure for this delectable food being approximately \$6.00 which alone speaks a volume within itself from a health standpoint.

"We have not nearly reached the point of saturation yet as there is an ever increasing demand from year to year, adding prominence to the enterprise in industrial life.

"The old anti-slogan of 'chill the stomach—retard digestion' days are past and the public is realizing, through splendid educational work, that every ingredient that enters into the finished article which comes to his table, is a pure, healthful food product.

"Doctors orders 'you can give the patient a little barley water' has been supplanted by 'give him ice cream and tell him to eat it slowly.'

"Your association has shown a splendid spirit of progress and enterprise and with a consistent and uniform continuation of such activity the ice cream industry of Ohio will be superior to that of any other state."

FRIDAY afternoon the discussion on refrigerated cabinets was led by Mr. Schindler of the Telling-Belle Vernon Company of Cleveland. Mr. Schindler spoke briefly on the experience of his company in

placing cabinets with retailers in town and suburban routes for experimental purposes. He did not, however, have any specific data on the cost of operation.

Considerable discussion followed Mr. Schindler's remarks and among other things it was stated that an allowance of five to seven cents a gallon is being made by certain other manufacturers to dealers who are furnishing their own refrigerating cabinets when the ice cream manufacturer had previously been furnishing the ice himself. One prominent manufacturer in the Middle West, who had refrigerated cabinets in operation for two or three years, came to the conclusion at first that five cents was the proper amount to allow per gallon but later raised this to seven cents.

Regarding keeping cabinets in first class condition and operation, it was stated that in the larger cities a service company would probably have to be organized for the purpose of caring for all of the cabinets in town. The different ice cream manufacturers would be the stockholders and subscribers to this and would pay for it on the basis of the number of refrigerated cabinets that they have in operation.

One of the delegates brought up the point that if refrigerated cabinets are installed it would render useless a good deal of the present equipment of the ice cream factory, including the expensive ice making machinery that many have installed, the present day cabinets, trucks, etc. This point was answered by another delegate who stated that this situation would easily take care of itself for deliveries on refrigerated cabinets are so slow that it would be impossible for anyone to secure enough refrigerated cabinets to take care of all of the trade for some years to come.

There was considerable time spent in discussing the ownership of the cabinets as to whether or not the ice cream manufacturer should be the owner. The consensus of opinion is that the cabinet should be the property of the dealer and the one point especially in favor of this consensus is that if anything happens to the cabinets it is the owner who is responsible, and if the owner happens to be the ice cream manufacturer he is liable. For instance, if a machine should be installed in a large department store and should spring a leak, which is liable to happen to any machine, and the store would have to be closed temporarily until the leak is repaired, the ice cream manufacturer would very likely have a suit for very heavy damages to face because of his ownership of the cabinet.

Another reason given as to why the dealer should own the cabinet is in changing the brand of ice cream. If an ice cream manufacturer puts a cabinet into a dealer's place of business, it costs him a considerable sum to make the installation. The dealer may change his mind in three months about the kind of cream he wants to sell and tell the manufacturer to take out his cabinet because he wants to sell another brand of ice cream. If the dealer owns the cabinet the expense of taking out or re-installing machines would be eliminated entirely. One of the delegates suggested that an agreement could be entered into between the different manufacturers in town whereby they would agree upon a standard price for different sizes and makes of cabinets that have been installed and the manufacturer could arrange to use the other fellow's cabinet when a stop is lost or gained.

A committee was appointed to recommend to the convention what action the Ohio association should take regarding the use of refrigerated cabinets. A resolution was offered, the substance of which is that

Try a Keg of Tutti Frutti Mixture At Our Risk

If you insist on using the choicest material in bulk fruit creams, fancy brick creams and mixed fruit ices, here's your chance. We're ready to prove at our risk that Reyam Tutti Frutti Mixture, while no higher in price than ordinary solid packed fruits, is head and shoulders above everything in quality.

Order a 5 or 10-gallon keg; try a half-gallon or gallon; if it isn't first class in every way return the remainder at our expense and without a cent to pay for the amount used. Reyam Tutti Frutti Mixture is solid packed, cold process goods, absolutely without waste. Keeps perfectly to the last drop and is ready for instant use. It will not freeze hard and the bright colored fruits show up beautifully in your bulk or fancy brick creams. Order a 5 or 10-gallon keg TODAY!

NORTH, EAST, SOUTH AND WEST—"REVIEW" IS LIKED THE BEST.

"in view of the involved nature of the refrigerated cabinet question, and the uncertainties of the situation, the committee recommends that no ice cream manufacturer of Ohio furnish refrigerated cabinets to any ice cream dealer to whom ice cream is shipped by express or other conveyance other than a truck owned by the manufacturer; that no cabinet be furnished by any manufacturer in the city or locality where they are not now in use except by mutual understanding of the manufacturers in such city or locality; that the dealer pay for current and water whether the cabinet is furnished by the dealer or the manufacturer and where now being paid for by the manufacturer that an effort be made to change the practice; also, that in view of the data available that the cost of ice and salt supplied is eight cents per gallon, an allowance of not more than ten cents a gallon be made to the ice cream retailer where free ice and salt were formerly given."

The committee asks more time to consider other involved points. Also, that the association not take any definite action regarding the cabinet question until the committee had had an opportunity to report.

J. Schmidt of the Cline Ice Cream Company of Athens, Iowa, discussed, "Legislation and Regulation." Mr. Schmidt is particularly interested in the standard question, which we understand is to again be brought before the Ohio legislature. It is being fostered by the producers of milk who are under the impression that a higher butterfat standard for ice cream would create a greater market for dairy products. Mr. Schmidt believes that there is a lack of understanding between the farmer and the producer of ice cream and that an attempt should be made through the larger organizations to show the farmer wherein he is wrong.

He believes that by interesting such men as Frank Lowden, president of the farm federation, the idea could be effectively advanced and the farmer could be made to understand that the ice cream manufacturer is more interested in the increase in the sale of ice cream, and therefore in the sale of dairy products than the farmer is himself and that the ice cream manufacturer is, therefore, going to do everything he possibly can to increase the sale of ice cream and that if he believes an eight per cent fat standard will sell more ice cream, the farmer should insist upon retaining that standard.

Mr. Schmidt also called attention to the need of a laboratory where dairy product manufacturers of Ohio could send samples of their product to be tested for butterfat and total solids. For the fee that ice cream manufacturers pay to the state department, they believe they should be able to install and maintain a well equipped laboratory for this purpose.

Another point brought up was the need of regulation required in the return of empty packers. Most states provide that packers must be washed and returned in good condition but they do not require their prompt return. The Wisconsin law, he stated, required the return within 72 hours but it is not very rigidly enforced.

Stanley Ross of the Moores & Ross Milk Company, Columbus, spoke on "Ethics in Ice Cream." His address will appear in an early issue.

A joint committee on the control of Babcock test operators gave their report which was as follows:

Control of Babcock Test Operators.

The joint committee on control of Babcock test operators made the following report:

Report of Joint Committee on Control of Babcock Test Operators

Your committee met on January 22, 1924, to discuss matters relative to the control of Babcock test operators.

Your committee finds that there is already legislation in Ohio governing over reading and under reading of tests, the enforcement of this legislation having been placed in the hands of the chief of the dairy and food division. It would appear, therefore, that the question for the Ohio Dairy Products Association to decide, is whether or not present legislation is adequate and effective. If found to be inadequate a second question arises and that is, shall the association seek to promote adequate legislation, either by amending the present law or having the law repealed, and having enacted a law that is satisfactory. Your committee feels that this question must be discussed and voted upon here at this meeting before further action can be taken in the matter.

C. K. WINSLOW
C. W. HAMILTON
O. W. LANDRUM

* * *

At a meeting of the milk distributors the matter was referred to the board of directors and they were instructed to confer with the Creamery Operators' and Managers' Association. The ice cream manufacturer voted to handle the matter in a similar way because the control of the Babcock test was chiefly of interest to them.

* * *

The constitution and by-laws adopted by the Ohio Association of Ice Cream Manufacturers will be published in the May issue of The Ice Cream Review.

Modern Ice Cream Plants Adopt the — CREASEY

THE efficient, wasteless and convenient handling of ice for packing is one of the notable economies effected in up-to-date ice cream plants. When the Seattle Ice Cream Co. built their big new plant three CREASEY 49 J motor-driven Ice Breakers of the type shown herewith were installed and the Victory Ice Cream Co. of Tacoma is putting in one of the same type. Other prominent users of Creaseys are the Hazelwood Co., National Ice Cream Co., Colonial Ice Cream Co., Breyer Ice Cream Co., Reid Ice Cream Co., French Bros. Bauer Co., Pend d'Orielle Creamery, Broadview Dairy, Los Angeles Creamery, Benham Ice Cream Co., etc.

Motor-driven Creaseys can be placed where most convenient without regard to line shafting and it is thus often possible to reduce ice handling costs and to save space. Ask for Catalog R-1125, describing other Creasey improvements.

Motor-driven Creaseys can be placed where most convenient without regard to line shafting and it is thus often possible to reduce ice handling costs and to save space. Ask for Catalog R-1125, describing other Creasey improvements.

Gentlemen: Will you be kind enough to write and give us the story of your ESKIMO PIE BALLOON DAY? We are interested in it.

Name

Address

City

The market of the originator is often the target of the imitator. ESKIMO PIE is the original ice cream bar.

It is known in every civilized country.

Imitators tried substitutes.

—But they proved failures. Nearly all have disappeared.

The reason is summed up in the words of a manufacturer who now makes Eskimo Pies.

He said: "Eskimo Pies are easier to sell than compete against."

Give your dealers Eskimo Pie, and be sure they put up window strips—then watch sales jump.

Proceedings of Southern Convention

(Continued from March issue)

Discussion of Advisibility of Uniform Ice Cream Law in Southern States

By CHAS. HOOBERRY

IT is said that a man may be proclaimed a hero in one state for a thing for which he might be hanged in another. The laws of our country were once such that a man might sit in congress who had a number of legal wives while another might be sent to jail for having two. The rights of states to make their own laws is a cherished heritage and one which is not likely to pass away. In our generation, when a man may fly from the Atlantic to the Pacific in a little more than a day and a night, may sit at his desk in Little Rock and hold a conversation with a business associate in New York one hour, and with another in San Francisco the next, returning home in the evening from a busy day's work, he may "tune in" his radio set and listen to the Municipal Opera in St. Louis and if he tires of the music, by a turn of a small dial he may pick up a lecture on Chiropractics in Davenport, Iowa, I hold that state boundary lines are growing less distinct. When a man refers to his neighbors now-a-days we do not know whether he has reference to a few square blocks, or miles. The relationship of people of the different states has grown so complex that the need has been keenly

felt for more uniform laws throughout the nation. The problem has been to meet the situation without abandoning the privileges of "State Rights." National organizations of business men engaged in various industries have succeeded in securing the passage in a number of states of certain uniform laws, drafted and approved by their associations which have helped the industries affected. We might mention the Uniform Negotiable Instrument Law as one of the most outstanding instances of such action. The bankers have succeeded in passing this act in nearly all of the states of the Union with very slight variation from the original draft. This act has served to simplify interstate business wonderfully by making the laws pertaining to commercial paper practically the same in all states.

It appears to me that the ice cream industry has grown to such proportions, and has become so stable, that legislation regulating it is highly desirable and this is borne out by the fact that legislation is being enacted on every hand regulating the manufacture and sale of the product. As ice cream manufacturers it is our duty to see that such legislation is constructive to the industry and not destructive. Prevention is always better than a cure and it is agreed that it is better to "lock the stable before the horse escapes—." We know that if a man dies in Texas from eating impure ice cream the newspapers of the land are quick to spread it, and sales in New York or Wisconsin are affected.

We know what a strenuous fight the olive association had to put up to counteract the terrific slump in that industry when a few cases of spoiled olives got into the market a few years ago. Quick action was necessary to save the industry. As an ice cream manufacturer I am interested primarily in increasing the general consumption of ice cream. I am for such constructive legislation as tends to build and hold public confidence in ice cream.

Pasteurization Necessary.

The ice cream industry is sufficiently organized to afford the machinery necessary for carrying out a program of uniform legislation. I believe that such an act is desirable but I believe that it should be drafted with care that the industry is helped and not hampered.

This would require that it be not so rigid as to injure legitimate manufacturers but sufficient to protect the public from danger. Such an act would simplify interstate shipment and lessen the risk of occasional embarrassment to the trade through impure and inferior product finding its way to consumers.

I would suggest that pasteurization be imperative the pivot upon which the act should swing. No ice cream should ever be sold which is not pasteurized. I would suggest 8 per cent butterfat and 33 to 34 per cent total solids as a minimum. This would insure the consumer a fair quality product under all conditions and yet allow manufacturers to cater to different classes of trade.

I do not believe that the market for a cheap ice cream should be destroyed, yet I do not think any one

"Green" Centers Impossible

Non-Plus-Ultra Pure Compressed Corkboard is moulded in sheets 24" wide, then cut into 12" widths, and the 2" sheets are made by splitting sheets 4" thick. Consequently you can see the inside of every sheet—see that it is baked through and through and that the center is not "green."

NON-PLUS-ULTRA CORKBOARD

is the only corkboard made that way. It is, therefore, the ONE make of which you can be certain as to structural strength and durability before it is installed.

Non-Plus-Ultra Corkboard also has square, unburnt, unbroken corners and edges, so it makes tight joints.

Other advantages explained in interesting booklet. Send for it.

A B-K Flush Every Day Before The Run!

From Here

to

Here!

R. J. Flick, leader in the Ice Cream Industry, says, "We start through, and rinse everything throughout with a solution of B-K—piping, freezers, everything."

Dr. G. S. Bote, U. S. Public Health Service, says, "Then a solution of B-K was run through before starting to freeze. The result was a finished product with the bacteria count per cc. reduced 98½%!"

Easy to Get Same Results

Every ice cream plant can greatly cut down the bacteria count with the simple, inexpensive B-K flush. A few cents a day means purified equipment from storage tank to freezer cans. Sterilizes completely in places like the freezing machines that cannot stand steam.

A New Day in Ice Cream Making

Health officials are beginning to give the attention to ice cream factories that they did to milk plants a few years back. Adopt a sure plan of sanitation now. Purified equipment is assured with the B-K flush.

should be allowed to sell the public ice cream poorer in quality than these specifications.

* * *

A few minutes was set aside for the discussion of the national convention in New Orleans in 1924, and at this time, J. L. Nelson, of the national Association of supply men, was introduced, and gave figures on the attendance and the expense of putting on the exhibit in Cleveland in October. Mr. Nelson stated that the supply men would put on just as good a show at New Orleans as they did in Cleveland, if it was possible to do so.

Several announcements were made by the secretary, and the meeting adjourned.

* * *

December 6, 10:00 A. M.

President Costa called the meeting to order and stated that only those who were manufacturers of ice cream would remain in the room during the morning discussion. The president asked for the report of the auditing committee, and the same was given with recommendation of a vote of thanks to the secretary-treasurer for the manner in which his report was prepared.

The advertising committee was the next to report, and the secretary submitted a proof of a design to be used by the members of the association, bringing out the idea that membership in the Southern association stood for quality and fair dealings.

This design was discussed from several angles and was accepted with some changes. The wording on the design was amended so as to read, "The ice cream served here is of a quality product because made by a member

of the Southern Association of Ice Cream Manufacturers."

Mr. Campbell made a motion that the secretary be empowered to give price in quantity lots on seals similar to the designs submitted, and to submit these quotations to the different members asking them to advise the secretary the quantity they would use. This motion was seconded by Mr. Sutton and carried.

Mr. Brooks, who had formerly made an address on advertising, was asked a number of questions regarding the best method of using the seal under discussion, and gave some valuable information. Mr. Geisel asked if the use of these seals would be compulsory. The president suggested that it would not, and that it would be optional with the members whether or not they used the seal adopted.

Convention City Selected.

The next order of business was the selection of the convention city and the recommendation formed by the old board of directors was submitted and was accepted by a majority of votes naming New Orleans as the next convention city, and setting the dates on November 14 and 15.

Under the head of new business, a motion was made that a vote of thanks be extended to the local hotel, local manufacturers, luncheon clubs, The Dixie Quartet, the local press, and to all others in Little Rock who contributed to the success of the convention. A motion was also made to thank the Dixie Flyers for the entertainment given by them, and for the assistance rendered the manufacturers during the convention.

A motion was made by Mr. Brown, and seconded by Mr. Kinnett, that the secretary be allowed the additional amount of \$250.00 for stenographic expense during the coming year. This motion was carried and made a part of the record.

Election of Officers.

Next in order was the election of officers. W. Barritt, was nominated for president, duly seconded and the secretary was instructed to cast the vote for the entire association for Mr. Barritt as president. This was done, and Mr. Barritt was declared elected and asked to take the chair. Mr. Sutton was nominated for vice-president, was duly seconded, nomination declared closed, and the secretary instructed to cast a vote of those present. This procedure was carried out and Mr. Sutton was declared elected vice-president. Next was the nomination of secretary-treasurer, and J. V. Clopton was declared elected by acclamation on a rising vote, no other nominations being offered. Fred Scanlon was nominated as representative to the national association. This nomination was seconded and carried. The directors were then nominated from their respective states, each of them was seconded and declared elected.

President Barritt then took the chair, and in a few remarks stated that he would do his utmost to have a bigger and better convention at New Orleans, than they have had this year. He assured the association that he accepted the position given him fully realizing the responsibility that goes with it, and that he would do his best to fill it with credit. Mr. Barritt asked everyone to put their shoulder to the wheel and to continue to work with the idea of making the 1924 convention the best we have ever held. No other matters coming before the convention, same was adjourned.

offered that the state of Oklahoma be accepted in the membership of the Southern association. This motion was seconded and carried, and J. B. Porter, delegate from Oklahoma, was advised of the acceptance of his state into the Southern organization. Mr. Porter nominated J. W. Parker of Enid, as director for that state. Mr. Parker was promptly elected.

The secretary was instructed to add a clause on the application blanks, showing the required standard for membership in the Southern association. The secretary brought to the attention of the directors, a matter

of publicity that had occurred during the past year, that was detrimental to the ice cream trade.

A motion was made that the secretary prepare a resolution that would be submitted to each member with the request that he refer his resolution to all local papers in his town. This motion was seconded and carried.

No other business coming before the meeting the meeting was adjourned.

J. W. CLOPTON,
Secretary

Truck Transportation

(Continued from page 40)

IF ANY fixed route seems to demand a truck of three tons, a truck of such capacity is the one you require. However, there are engineering features connected with such an installation. You require a very heavy body in the transportation of ice cream and special attention should be given to springs, axles, frame members, the transmission and even the engine. Every three ton truck will not fit. When you want advice on legal matters or you want a pain in your stomach diagnosed, you go to the proper source for advice. Buying a truck means that you are investing more money in your own business. Factories and dealers have engineers who have been trained in the field of motor transportation. They are equipped to give you advice on the proper equipment needed. They will lay out schedules, time charts, cost accounting systems for you. They will tell you where you may dispense with horses and where horses may still be used profitably. These men will not suggest your buying motor equipment except when they find it will cut your costs, increase your business and your income. Do not attempt to solve this matter yourself. Do not be misguided by a salesman unless you are certain he knows his business but go to the dealer or the factory. Do not experiment, but be sure—then go ahead and motorize.

You get your product out on schedule. You are equipped with the proper machinery for quantity production. You have a customer a few miles out who has a little store. But he must have goods if he is to continue his business. His ice cream stocks have a greater demand in certain seasons and those stocks must be kept up and kept fresh. He suffers if they run down or deteriorate, and so do you as the manufacturer. With the motor truck running on schedule you stop in front of his store every day at a certain specified time. You are as regular as a first class passenger train. Your goods earn a reputation for freshness and quality which a local product cannot compete with and as a result new business avenues will open.

I know of delivery contractors who have constantly lost business because they would not change from horses to motor delivery. Business today moves at a faster pace than it did a dozen years ago. A greater consumption of goods of all kinds is going on day after day. Methods of transportation have been perfected so that maximum output is assured. The retailer cannot exist unless he can receive his goods when needed. He cannot allow himself to get in a position where he is frequently obliged to say, "Yes, we have no strawberry ice cream today." He may lose a good customer by it. Sally Brown may be in the habit of dropping into his store to get her favorite flavor every day at noon and she expects it. I know that I lose all patience with a drug store or dispenser of ice cream if he fails to have my favorite concoction of frosted coffee, and I soon

change my patronage to a more up to date establishment for I am not satisfied with substitutes.

KEEP your deliveries up to and always a little ahead of consumer demands and demands will increase, the market expand and with it your costs will fall as greater production of product follows.

You know the relation that all forms of transportation have borne to business from retail selling of finished goods clear back to raw products. You know how limited marketing compares to big scale production and selling. You know that expansion does not go hand in hand with slow moving methods. That is why you are using machinery and power in production. If your deliveries are confined to the limited territories of 15 years or two years ago, you are not growing very fast but if you are digging out and taking advantage of new business which you can get, if you are reaching out to the city grows and even beyond to communities 50 or 75 miles away, you are assuming the position of leadership in your business. But for such expansion the motor truck offers you the greatest possibilities.

Make your equipment attractive. Good paint and lettering is good advertising. A motor truck carrying your name is very attractive. Don't be satisfied with a cheap job. A good artist can do wonders with good colors. An attractive girl or child with a plate of ice cream in the attitude of offering you some, especially on a hot day, attracts attention, fosters admiration, and as Coue says that all action is prompted by mental suggestion, it is safe to suppose that he who reads it immediately hie himself to the nearest store displaying your familiar sign and partake of a cooling beverage of his favorite ice cream.

Advertising values lie in circulation and as you are on your motor truck is constantly moving, it is of greater value than a stationary sign on the top of a building in that it is probable that the stationary sign costs more per year than your movable sign and transportation combined.

There are more reasons why you need motor truck than I can give you in the limited space of time that I have. You may need one or fifty according to your capacity for production and the extent and radius of your markets, but I am certain that every member of this organization can find good use for them in his business.

Instead of using window-strips, the Terry Dairy Company, Little Rock, Ark., headed by A. J. Terry, has a high school boy, who is handy with a brush, who colors signs on the retailers' windows every two weeks. This costs Mr. Terry only \$35.00. He says it materially boosts his ice cream sales.

THE GEARHART

Selective Sales Cabinet

A cabinet that really SELLS ice cream. Placed out where the people see it. Variety of contents plainly displayed on removable signs. A turn of the handle brings desired flavor to opening. No digging around to find what is wanted. Quarts, pints, half-pints all available on the moment.

Uses only 4 pounds of ice per gallon of ice cream per day.

Package sales insure dealers of full volume without shrinkage.

Made in two sizes, 24 and 13½ gallon capacities. Takes up only 40 inches of floor space.

We will be glad to show you some real sales results from these silent salesmen.

The Gearhart Ice Cream Package Filler fills 40 packages at one time, either Quarts, Pints or half-pints. Absolutely full measure. No waste. Each carton is spotted and then clamped fast; the top is then brought over and the openings being beveled slip securely over the cartons. The exact amount of ice cream is then poured in and leveled. The top is thrown back and the cartons topped and closed. Compact, only occupies 20 x 40 inches.

Send for illustrated folder showing operating details.

CHERRY ANNOUNCES AUTOMATIC METHOD OF PASTEURIZING.

The J. G. Cherry Co., Cedar Rapids, Ia., announces what it calls a new automatic method of pasteurizing. This method incorporates the automatic TAG U-K Controller by which the human element is entirely eliminated.

The Cherry automatic method, by automatically operating all milk inlet, milk outlet and heating coil valves, assures that every batch is pasteurized at the same temperature and held for the same length of time, it is claimed. The absolute accuracy and perfectly time controlled occurrence of every stage of the pasteurization secures the following advantages, it is claimed:

1. Positive holding as to temperature and time.
2. Better cream line.
3. Lower bacteria count.
4. Lower temperature water metering.
5. Better flavored milk.
6. Continuous delivery flow.
7. Entire elimination of the human element.
8. Saving of labor.

Present batch pasteurizers, we are told, can be converted to operate under the Cherry automatic method.

Cherry officials say an installation made at the Woodlawn Farm Dairy Company at Scranton, Pa., operated with entire success. H. J. Jones, president and general manager of the Woodlawn Farm Dairy Co., said of the method as follows:

NEVERLEAK — ABSOLUTELY —

That's the new

Cotton Fibre-Wood Sales Co.
MEMPHIS, TENNESSEE
OAKLAND AVENUE AND BELT LINE R. R.

"The flavor of the milk has been improved, as well as the cream line, and the bacteria count by our tests have been lowered considerably. We have been able to remove the human element by the installation of the automatic controller. Every pound of milk has been pasteurized accurately and held at a desired temperature. It has allowed us to work with a system having an ever continued flow whereas in the past we would run in spurts."

The name of the automatic controller, "TAG U-K," is a combination of the names of the C. J. Tagliabue Mfg. Co. and the Uhlman-Kinsey Co., the controlled being jointly developed by these two organizations. The controller is made exclusively for the J. G. Cherry Co.

ELECTRIC CONTROL TYPE TEMPERATURE CONTROLLER.

The C. J. Tagliabue Mfg. Co. announces the addition of an electric contact type temperature controller to its line of indicating, recording and controlling instruments. The following description is given by officials:

"This electric contact controller consists essentially of a dial-indicating thermometer, the pointer of which is actuated by the usual mercury, vapor-tension, or gas-filled thermostatic system, depending on the desired range and other specifications. The bulb stem is inserted in the oven, furnace, tank or other apparatus where the temperature is to be controlled and is connected by a capillary tube to the case which can be mounted at any convenient location. As the temperature at the bulb increases or decreases, the thermostatic spring uncoils or recoils, thus moving pointer across the scale. The exact temperature existing at the bulb is thus indicated at the case and the responsiveness and closeness of the control may be determined.

"The temperature is controlled by the following arrangement: On each side of the indicating pointer is located an arm. These arms are mounted on the axis of the pointer and have mounted on them auxiliary contactor arms. By adjusting the left-hand arm to point to the minimum temperature, and the right-hand arm to point to the maximum temperature, control is established between these two points in the following manner: When the indicating pointer reaches the minimum temperature, its contact block makes an electric contact with the left-hand arm closing a circuit through binding posts L and C which operate through a relay to close the circuit of an electric heating coil. The current continues to pass through this heating coil until the indicating pointer reaches the maximum temperature and makes an electric contact, with the right-hand arm closing a circuit through binding posts C and H.

"The controller may also be used for starting and stopping a motor by means of a motor-starter as in the case of an automatic refrigerating unit. The least difference between minimum and maximum control temperatures is approximately 1/32 inch. It cannot be expressed in degrees of temperature unless the range of the scale is known."

An adjusting screw is provided for simultaneously lowering or raising the minimum and maximum temperatures at which the indicating pointer closes the circuit. This is accomplished by moving the arms together as a unit to the right or left.

1923 WAS YEAR OF UPS AND DOWNS FOR SUGAR MARKET.

Sugar refiners in 1923 had all the ups and downs of a ten year pre-war period, according to Earl D. Babst, president of the American Sugar Refining Company. The inventory of the company fluctuated as much as \$2,500,000 in a single day Mr. Babst states in his annual report. The price of raw sugar changed 115 times, he declares, and the extreme fluctuation of 3.375 cents per pound in raw sugar prices during 1923 was greater than the fluctuation of the entire

Gentlemen:

During 1922 we purchased irregular shipments of your Velvet Egg Yolk during which time we bought also from other sources, but in 1923 we contracted for your goods and had you make shipments at regular intervals.

When our contract expired, we wandered around to different markets and purchased egg yolk from various sources and at various prices, and as evidenced by our recent contract for fifty barrels Velvet Egg Yolk, we decided your goods were far superior to any we have yet tried and we gladly pay you an increased price for the quality and uniformity of your goods.

Our experience was somewhat similar with your Velvet Concentrated Flavors and hope we shall use more than the contract of fifty gallons recently given you for this season.

We dearly love to have a word from our satisfied customers and believing you of the same disposition we are prompted to send this letter.

Yours very truly,

ten years preceding the World War, in all of which time it was only 2.725 cents.

The report shows that the American Sugar Refining Company received profits of \$8,508,163.35 in the form of investment income and interest. Of this amount, \$5,552,487.95 represented income from investments, largely in sugar producing companies. This sum, together with \$2,955,675.40 interest earned, was sufficient to cover a loss on refining operations of \$1,693,070.01 and to provide for depreciation bond interest and preferred dividends, and leave a balance of \$865,107.34, which has been added to surplus. Sales of various investments yielded a profit of \$4,542,631.10, which has been set aside to strengthen the company's refining facilities in New York harbor.

The year 1923 was unprofitable for cane sugar refiners, the report says, and the loss of \$1,693,070.01 on 1,165,000 tons of raw sugar refined by the company during the year is ascribed by Mr. Babst to the 115 fluctuations of raw sugar prices. In 1922, he pointed out, the company refined 1,650,000 tons at a profit of \$10,083,832.55.

Sales of the company totaled \$200,000,000. Nearly 600,000,000 pounds of package sugar alone were sold.

Jacob Noodleman, for several years well known among Southern ice cream manufacturers as president of the Texas Barrel Company, has announced his resignation from that firm to engage in business for himself under the name of the Houston Cooperage and Tub Company, Houston, Tex. He is president of the company.

The Houston Cooperage & Tub Company, according to Mr. Noodleman, will manufacture ice cream tubs, cabinets, kegs and barrels. Mr. Noodleman is widely known in the Southern trade.

JACOB NOODLEMAN.

The DeFoe-Colvin ice cream mold is used in bulk ice cream. The frame of this mold is constructed of a tin alloy die-cast. The bowl and knives are of German silver and all parts are heavy nickel plated, and highly polished. The spring is concealed and there are no parts to corrode. The mold is entirely sanitary, it is claimed.

The mold is claimed to have been designed by a practical retailer in the ice cream trade who discovered during many years of experience with hand molds and slicing brick ice cream that there was too much loss in time and material. This mold will measure 20 sandwiches to a quart of bulk ice cream. There can be no inconvenience for the retailer now to serve ice cream sandwiches as there has been in the past, it is claimed. He can make them more easily and quickly than cones, make more profit for himself and give real satisfaction to the trade, we are told.

IMPROVING THE CHOCOLATE MIX.

A discovery which he says will make it possible to manufacture chocolate ice cream of hitherto unknown smoothness and richness, through the use of Impruv-Mix in the chocolate mix, has been announced by M. P. Abel of the Impruv Mix Co., 2460 Amsterdam Ave., New York City. Experiments by chocolate-dippers brought out the interesting fact that "Impruv-Mix gives to chocolate a quality of smoothness that better brings out the taste," said Mr. Abel, who added that subsequently it has been demonstrated that its use in the chocolate ice cream mix not only brings out the flavor of the chocolate in a most pronounced way but also brings out the flavor of the cream and creates a blending that "gives chocolate ice cream a new and more delightful meaning to consumers."

This product has been used for several years by manufacturers in many parts of the country for its neutralizing effect for imparting a "real fresh cream flavor," but heretofore it was not known that the product also could be used to bring about a blend of the flavors of the chocolate and the cream. With this new discovery, according to Mr. Abel, we

Now You Can Make Money Both Ways

Our new sales policy makes it possible for progressive ice cream manufacturers to get Sanisco Ice Cream Sandwich Machines working for them without one cent of investment on their part.

Furthermore, for every Sanisco Machine placed in accordance with our plan we allow a liberal commission that can be retained by the ice cream manufacturer, given entirely or split with the salesman. The inducement offered ice cream salesmen to get Sanisco Machines in their territory means ever increasing sales for the ice cream manufacturer.

New Sales Opportunities With a Sanisco.

Your salesmen can now offer a real practical and money making method of selling ice cream at

WINDOW FLAVOR STREAMERS.

Many ice cream manufacturers believe the flavor window streamer has gone far toward solving the problem of boosting gallonage. This streamer, a strip about six inches in width and twenty-five inches in length, posted in the window makes a taste appeal to every person who passes by the store of man who sells ice cream. Some manufacturers believe this method presents the most direct method of advertising of any possible in the ice cream field. It is claimed actually to make sales at the time when the people are ready to buy, to offer suggestions when the customers are prepared to act upon the suggestions, and to create the "ice cream habit" among people who never dreamed that they could acquire it.

Ryan & Timberman, Inc., Wilkes-Barre, Pa., who originated the taste appeal window flavor streamer, for nearly nine years have been specializing in ice cream accounts, and its personnel is made up of men and women who know the ice cream manufacturing problems, merchandising and markets "from the bottom up," we are told.

Simultaneous with the "week-end special," Ryan & Timberman, Inc., ice cream advertisers of Wilkes-Barre, Pa., brought out a special window flavor streamer which has since been used by principal ice cream manufacturers in every part of the United States, it is claimed. Primarily, the flavor streamer was designed to tie up with the week-end special. This streamer, officials of the company say, was made so it could conveniently be placed on the window of any store and make an attractive appearance on the glass panel of the back bar. It told the story of fig-walnut ice cream—or whatever kind happened to be featured—in pictures. At one end of the streamer was a tempting dish of fig-walnut ice cream. In the center was the message that fig-walnut ice cream was special for the week-end.

"Through the streamer," according to Lewis E. Ryan of Ryan & Timberman, Inc., "every passerby was informed of the special. It grasped every imagination; made people who had no intention whatever of buying ice cream that evening come in and

The Mark of Merit

The New Universal Homogenizer

A Combination of the best high pressure pump and the longest lasting valve.

The Universal embodies all the advantages of old time machines in addition to many much needed improvements.

Heavy duty construction insures long life under continuous operation.

Individual cylinders machined from rolled Tobin bronze bars (not cast).

High pressure manifold machined from rolled Tobin bronze having tensile strength of 55,000 pounds.

Individual shimming of cross-head slides maintains correct individual alignment of pistons at all times.

Chrome vanadium steel shafts.

Monel metal pistons not affected by milk acids.

Homogenizing valve—internal spring type —Plug and seat are made of an alloy of semi-precious metals so hard it cannot be machined but must be ground with carborundum.

Built in belt or motor drive sizes 200, 400 and 800 gallons.

buy some to take home. It veritably offered a special invitation to every individual through 'making his mouth water' at exactly the time when he was in a position to buy ice cream.

"In most cases the cost of this streamer did not exceed a couple of pennies—yet it actually produced more sales than many types of advertising running into dollars. It was found that the dealers fell in with the idea readily because the streamers actually did produce immediate business and the dealers were not only willing, but eager to display them. The low cost of the streamers was and is, of course, made possible by the huge quantities in which they are manufactured by the advertising agency.

"Last season principal ice cream concerns in all parts of the United States used the Ryan & Timberman streamers with phenomenal success."

Ryan & Timberman, Inc., report that orders for streamers for the coming year have been received from every part of the country and that they are literally swamped with orders beyond all expectations. The number of streamers which will be used to sell ice cream during the coming season will be high up in the millions, it is claimed. Some large concerns have already signified their intention of purchasing as many as 100,000 streamers during the coming months, according to Mr. Ryan.

NEW HEAVY DUTY ICE BREAKER WITH MOTOR DRIVE.

Many of the large ice cream manufacturers, such as the Breyer Ice Cream Company, Philadelphia; the Reid Ice Cream Company, Brooklyn; the National Ice Cream Company, San Francisco, and others, are said to be putting in motor-driven ice breakers for preparing broken ice for packing and for the icing of trucks, as the individual drive permits of locating the breaker where it will fit in best to reduce ice handling

and irrespective of shafting. The slow speed motor is mounted on top of the ice breaker frame and is connected to the breaker shaft through a silent chain running in oil. A cast-iron baffle protects the motor from flying pieces of ice and water, while the chain is enclosed in a substantial casing and runs in oil.

This ice breaker, which is manufactured by the H. S. I. W.—Cochrane Corporation, Philadelphia, has been made especially heavy and rugged to meet severe service, according to the manufacturer. The front plate or anvil against which the ice is broken is made of semi-steel and is re-inforced with deep ribs. Semi-steel has a tensile strength of 30,000

Mojonnier Bros., Chicago, calls attention of the readers of The Ice Cream Review to the fact that in addition to the several types of cartons that are packaged by the Mojonnier ice cream packaging machine is the Purity paper can, made by the Purity Paper Vessels Co., Baltimore; also the Dixie cup made by the Dixie Cup Corporation, Easton, Pa.

* * *

For the public who desires ice cream in sealed packages, the retailer is meeting the demand by affiliating with the ice cream manufacturer who can furnish ice cream packed in this manner. The Gearhart Sales Cabinet Company is offering a new development in the line of ice cream package fillers. The Gearhart filler will fill quart, pint and half-pint cartons without waste, it is reported, and in a very short time with little effort and without having the product touched by human hands. The filler occupies little space and is substantially built and easily kept sanitary. The dealer is provided with a Gearhart sales cabinet which keeps the packaged ice cream in perfect condition. The cabinet will carry six flavors and three different sized packages, quarts, pints and half pints and the packages are kept clean and dry and there is no freezing together. It helps to serve customers quickly. The cabinet is iced once every two days and requires less than four pounds of ice per gallon of ice cream a day. The salt water can easily be drained off. The cabinet has a capacity of 24 gallons and occupies a floor space of 40 inches. The ice cream manufacturer fills the cartons and controls the cabinet. The cabinet is refrigerated in cylinder form of sheet metal, insulated with three inch cork board and operates on a vacuum system, there being six revolving, moisture-proof compartments, each one packed with ice cream cartons in quart, pint and half-pint sizes. Through the device shown in their advertisement at the side of the cabinet the proper compartment is brought to the front of the cabinet and a carton of the desired ice cream is taken out at the door provided. The Gearhart Sales Cabinet Company is at Clearfield, Pa., and they will be glad to mail illustrated literature to any ice cream manufacturer who is interested in their cabinet and filler.

MAPLE PLAINS CREAMERY COMPANY RE-BUILDS PLANT.

The Maple Plains Creamery Company, Inc., Maple Plains, Minnesota, of which F. V. Halgren is president, is rebuilding the plant which was destroyed by fire last December. They have incorporated with capital stock of \$50,000, and the new plant which will cost about \$20,000 when complete, is 42x62 feet. The hardening room will have a capacity of about 1,500 gallons of ice cream. They expect to begin operation about May 1st and will continue the manufacture of Halgren's ice cream and butter. Much new equipment, including churn freezers and compressor is being installed.

NEW ICE CREAM PLANT IN OKLAHOMA.

Colvert Brothers of Sulphur, Okla., have erected a stone building 75x50 feet which will be a modern ice cream plant equipped with up-to-date machinery for the manufacture of a high grade product. Refrigerating machinery manufactured by the United Iron Works of Kansas City, Mo., has been installed. The plant will be in operation within the next sixty days.

Sulphur is one of the finest summer resorts in the United States and ranks about fifth with all the National parks in the world.

The Quality Ice Cream Co., has opened at Pleasantville, N. Y., and the proprietor is J. M. Bard. He formerly was with the Carpenter Ice Cream Company of White Plains, N. Y.

CONTROLLED FLASH PASTEURIZATION.

Positive pasteurization of cream which could really be called positive has been the difficulty which every operator has experienced in the past when using any continuous flash pasteurization system. It has been difficult to maintain the temperature of the cream within the proper limits by hand regulation of the steam supply valve.

A new bulletin, No. 2049R describing the Cherry "continuous flash" pasteurizers was issued a few weeks ago. It tells in detail of the control system of continuous cream pasteurization. A temperature regulator controls the steam minutest rise or fall. The manufacturers claim that the system is absolutely dependable and very positive in action.

This new bulletin explains the tandem system of mounting pasteurizers which delivers greater capacity rated in pounds per hour. It is said that this method requires less steam, representing a saving in fuel; also allowing for better neutralization.

This bulletin describes, also, the new No. 7 Cherry continuous cream pasteurizer. It is a large capacity pasteurizer rated at 7500 lbs. an hour. Several new features are used in the construction of this machine—a new clamping style of cover is used; the agitator has a pump wheel built as a part of it, giving a guaranteed elevation of the pasteurized product; and is built in only the overhead drive.

The J. G. Cherry Company of Cedar Rapids, Ia., announces that this Bulletin No. 2049R will be sent promptly to any readers who mention this publication.

* * *

Prof. H. C. Troy of Cornell University has written an article entitled, "Ice Cream Test by Troy-Fucoma Method," in which he gives information for testing ice cream with the Fucoma apparatus, supplied by the Fucoma Company, Inc., 154 Nassau St., New York City. The article is incorporated in a booklet supplied by this company. The foreword states that this test is radically different from any of the methods now in current use. It is claimed to be much more rapid than the present methods and may in time be used widely by the field for quick inspections to show whether the fat content of ice cream is up to standard. Its simplicity is said to be a feature commending its introduction to the trade and it is further claimed to be accurate enough for all practical purposes.

* * *

The Creamery Package Mfg. Company, 61 W. Kinzie St., Chicago, announces the publication of a bulletin illustrating and describing its complete line of Progress homogenizers.

This book details the various uses of the homogenizer in the ice cream plant, milk plant and many other different lines of business and gives complete data covering every important part in the machine. Homogenizer users and those contemplating the installation of such machines will obtain considerable valuable information from this bulletin, officials of the company believe. A copy will be sent free of charge to all who write the manufacturers, it is announced.

* * *

L. F. Grammes & Sons, Inc., Allentown, Pa., announces that it has issued a new catalog for ice cream manufacturers and that officials will be glad to forward catalog to any reader of The Ice Cream Review upon request. In the past few years, according to officials, the company has turned over a large portion of its plant to the line of ice cream and soda supplies which it sells directly by mail. The company has been in business since 1875, officials say.

Rochester, N.Y.

EVERY MANUFACTURER IN THE COUNTRY SHOULD BE A MEMBER OF THE NATIONAL ASSN. OF ICE CREAM MFRS.

A CASH BASIS FOR THE ICE CREAM INDUSTRY.

(Continued from page 9)

"Anyone who makes an examination of the credit side of any business, whether wholesale or retail, is appalled by the carelessness with which credit is granted, and the fact that as a group we are careless in granting credit is hardly controverted....

"Ignorance of the costs of doing business, credit losses and collections, desire to outdo competitors in volume of business without regard to the quality of the business, fear of driving away business by requesting credit information, and lack of a definite collection policy are some of the reasons responsible for the stupendous losses we suffer. Is there a remedy? We believe there is.

—"When spring arrives after a long, cold winter, most of us are ready and willing to take all the business that comes our way, with little examination or investigation. A competitor's customer calls us and gives us an order. Do we find a reason for his sudden change of heart? An inquiry might save us considerable trouble, worry, and perhaps a loss."

THERE are many reasons for believing that the loose credit practices in the ice cream industry are ready for the tobogan. In the first place ice cream manufacturers themselves have learned that it is very poor business. It would be interesting to have some gentlemen with a flair for figuring to set down in round numbers just how much money has been lost in the industry in this way.

The principal reason for the tightening up in the credit situation is, manufacturers are beginning to understand that it is not necessary. Ice cream is just as

much a legitimate article of commerce as anything else sold to the public. It gives the retail dealer a certain margin of profit that is fair, to say the least. Just where he should be made to feel that he doesn't have to bother himself about looking after his ice cream accounts, something no one can satisfactorily explain.

Watching credits means money to the ice cream industry. It means the saving of losses to manufacturers and greater gains through better business practices upon the part of the dealer once he is convinced that selling ice cream is a business proposition. It is a fact that many dealers do not look at the matter fully in this way. For they been doing things just as they please and paying when they please (and sometimes not paying when it didn't please them), so that many of them looked at handling ice cream as a sort of game, the object of their part being to see how much they could talk out of the manufacturer at one time and then see how much they could hold out from him at another time.

AN ALABAMA manufacturer several months ago put in vogue a system where his dealers paid every Monday morning. They were educated to expect a bill the first thing at the beginning of every week. It was a short time before every dealer was regularly sending in his check upon receipt of the bill, with never a complaint.

A manufacturer in Pennsylvania, who thought he was making considerable progress in building up his gallonage, suddenly awoke one day to find his business books in bad shape—very bad shape. When he looked into the situation he suddenly made the discovery that he had unknowingly taken in a number of "dead-heads" instead of actual customers, these "dead-heads" representing several dealers who had mysteriously communicated with this manufacturer at different times and expressed a willingness to buy his ice cream. Further investigation revealed that most of them already had imposed upon one or more manufacturers in that territory by straining their credit to the breaking point and then "flopping."

The situation in the long run proved of great value to this manufacturer, for he immediately faced the situation squarely and put down tight clamps upon his credits, with the result that in a very short time he had cut down his list of dealers, eliminated much cost in doing business, and was prepared to help his good dealers sell more ice cream.

A New England manufacturer, quite by accident found out that he could line up a more stringent collection system in his business. An excitable dealer called up the manufacturer and said he would pay his bill when he got "dern good and ready." The manufacturer, his patience exhausted at the end of a nerve wracking day, impulsively declared that he had better get ready before the end of the week if he continued to receive his ice cream from the same place. Before the end of the week a check came in. The manufacturer acted upon a sudden inspiration and decided that instead of making a visit to hear his dealers complain, he would do a little complaining of his own. When he finished a circuit of his dealers in immediate walking distance he had underway the nucleus of a system providing for better credits—a system that has made much money for that gentleman.

If you want help for your factory, the quickest and cheapest way to locate same is through The Ice Cream Review Want Department.

THE priceless ingredient of any product is the honor and integrity of its maker. If you can depend on the reliability of the House from which you buy, you can be assured of satisfaction.

Into the composition of DERYCOTE Tub and Can Enamel, The National Paint & Varnish Co., has put that dependability and reputation achieved from twenty-one years of satisfactory service, and distribution of "paints for specific purposes."

has given satisfaction because of our desire to live up to our reputation and give you the BEST that years of experience and research can possibly give.

You can soon learn why DERYCOTE does please. Try it yourself.

Ice Cream Salesmanship Taught at Dealers' Convention

Breyer Ice Cream Co. of Philadelphia Sponsor Convention of Retailers
Within 50 Mile Radius of Quaker City

THE most sweeping undertaking in the interest of ice cream retail salesmanship on record for the industry was carried out last month by the Breyer Ice Cream Co. of Philadelphia when dealers of eight states were gathered at a merchandising convention in the City of Brotherly Love. The convention was held March 24, 25, 26 and 27 in the auditorium of the Breyer company's plant.

The object of the convention was to teach dealers efficiency in the handling of their stores and merchandise, and to point out the way to greater profits through correctly handling ice cream and seeking to keep it before the public.

There were two convention sessions each day, one in the afternoon and one in the evening. Experts on various phases of retail salesmanship addressed the convention delegates.

Among the subjects discussed were: "Selling the Customer More Merchandise," "The Best Way to Lay Out a Store," "Knowing Daily Your Profit and Loss," "Store Arrangement and Alteration Costs," "Cashing in on Your Windows," "Selling the Housewife," "Selling Stunts That Paid," "The Dealer Profit in Pure Food," "Systematizing Your Store for Greater Profits," "Ice Cream as a Profit-maker," "Ice Cream as a Food."

The convention was attended not only by dealers handling Breyer ice cream, but by retailers handling many other brands.

Special trains and hotel accommodations were arranged for the delegates by the Breyer company. There was a display of products of well-known makers of ice cream store products and accessories. The convention cost many thousands of dollars, everything being free to the dealers. The entertainment features included vaudeville, sight-seeing tours and refreshments, the dealers' families being entertained at the same time.

Between eight and ten thousand ice cream dealers representing practically every city and township within a radius of 150 miles from Philadelphia, Pa., attended the convention which was held under the direction of the Breyer organization, and marked the formal opening of the recently completed Breyer plant, said to be the largest in the world.

The huge auditorium of the Breyer plant took on the aspect of a sectional ice cream manufacturers' convention with nearly forty booths displaying supplies and equipment used by the ice cream dealer lining three walls. The stage at one end of the hall was banked with cut flowers and set pieces, gifts of well-wishers on the occasion of the opening of the new plant.

On the opening day, after an inspection tour of the plant, the dealers were ushered into the auditorium where the sessions were to be held. Before the meeting was called to order, an elderly man attired in apparel of by-gone days—knee breeches, white stockings and cocked hat—wandered up to the platform and demanded to see Henry W. Breyer, president of the Breyer company.

When Mr. Breyer was presented to the quaint old gentleman and his name was requested, he replied:

"I am here as the shade of old Philadelphia to greet and wish you well, you, sir, the business man of modern Philadelphia, on this the day that will always be looked back upon not only by yourself but also your associates, who labored so nobly to make this dream of yours a reality.

"Since the days of William Penn, the city of Brotherly Love has always been lavish in her gifts to her sons who had

the courage to dare, and the vision to see. Even though this institution that you have developed is now the largest of its kind in the world and your product is sold in seven of the thirteen original states, may it always be 'the old fashioned kind' that Philadelphians have known and enjoyed for two generations.

"I give you an emblem of esteem and devotion. The token from your co-workers in this enterprise is a pledge of you of their allegiance as your own 'Pledge of Purity' is to the public."

The emblem, a solid gold medal, presented to Mr. Breyer by his employees, has on the face in bas-relief a female figure signifying Progress and Vision, and on the reverse side, Henry W. Breyer, Manufacturer, and on the other side, W. Breyer, from his associates in the Breyer Ice Cream Company. Presented March 24, 1924, at the opening of his new West Philadelphia plant.

This feature was not on the program and it apparently proved as much of a surprise to Mr. Breyer as it did the audience as he was not prepared to make a speech of acceptance but modestly retired with "I thank you, sirs!" amid the thunderous applause of the audience.

The opening session was then called to order and the welcoming address made by E. J. Mather, general sales manager of the Breyer company.

Mr. Mather introduced the first speaker, R. D. Small of the National Cash Register Co., Dayton, O., who spoke on "Knowing Daily your Profit and Loss." He urged the retailers to keep accurate records and departmentalize their store. With the aid of a chart he pointed out the proper systems that should be used to keep strict accounting of all merchandise. He estimated that 75 per cent of the retail stores in the country that were not departmentized were handling many lines of merchandise at a loss when the dealer believed they were profitable.

He was followed by J. E. Reider of the Reider Manufacturing Co., whose subject was "The Best Way to Lay Out a Store." It has been proven, he said, that it isn't how good the merchandise is or how popular the selling price, but how well the product is displayed that brings results. He further said that the days of cheap second hand fixtures were gone forever and that the buying public today demanded pleasing surroundings that harmonize with the merchandise on display. He referred to the appearance of his store as the retailer's best advertising medium.

Dr. E. J. Cattell of the Chamber of Commerce opened the evening session with an address of welcome on behalf of the city of Philadelphia.

Among the exhibitors were the following:

American Cone & Pretzel Company.
Armour & Company.
Bishop, Babcock Company.
F. Bischoff, Inc.
Benedict Mfg. Company.
Dayton Scale Company.
Enterprise Paper Company.
Flexlume Sign Company.

CORRIZO EXTRACT COMPANY

211-215 West 20th Street

NEW YORK, N. Y.

GEORGE W. CUSCADEN, PIONEER MANUFACTURER, DIES.

One of the most interesting members of the ice cream industry passed from the scene on March 11 in the death of George W. Cascaden, Sr., founder and president of the Cascaden Ice Cream Co., Louisville, Ky. Entering

GEORGE W. CASCADEN.

the ice cream business in 1875 by launching the company that still bears his name, Mr. Cascaden was a connecting link between the early days of hand-labor and the present age of highly organized mechanical efficiency.

The first man to engage in ice cream manufacturing in Kentucky, and one of the first in the entire country, Mr. Cascaden many years ago became known in his section as "the ice cream king." His ice cream factory was established five years after he opened a confectionery business in Louis-

ville. He was the first to vision the possibilities in shipping ice cream by rail, and he had been in business only

a short time before he was delivering ice cream through express cars to dealers many miles from his plant.

Even in the olden days Mr. Cascaden shipped ice cream as far as Virginia, down into Tennessee, and in many parts of Indiana.

In 1899 Mr. Cascaden invented a machine for making ice cream in four colors and flavors. He had the machine patented and used it many years in making thousands of gallons of brick ice cream. He gave up the brick ice cream business about three years ago.

The Cascaden Ice Cream Co. flourished under the management of its founder until his sons came along to take over most of the burden of operation, the business continuing to grow. For the past several years the company has been mostly in the hands of the younger Cascadens, Arthur and Harry A. Cascaden. The youngest son, George Cascaden, Jr., operates a retail confectionery known as the Cascaden Confectionery.

Ice cream manufacturers throughout the South have extended appropriate messages.

NOTES OF THE OHIO TRADE.

By C. J. Yuncker, Pres. Michigan Dairy Boosters.

S. H. Weeks, proprietor of Buckeye Dairy Co., Galion, Ohio, was seriously injured on February 10 in driving a truck which was hit by an electric interurban car, completely wrecking the truck and having his right leg broken in two places.

Ashland Sanitary Dairy, Ashland, Ohio, is making some improvements and getting ready for the rush of the season.

The Wells Chief Creamery Co., Crestline, Ohio, will install another ice cream freezer at once to take care of their increase of business.

The White Mountain Creamery Co., Lima, Ohio, is getting everything ready and all painted up for the rush of 1924 trade.

D. A. Heckler Ice Cream Company, Napoleon, Ohio, has their new building completed for their ice cream and bottling plant. It is very neat and roomy.

The Standard Creamery Company, Van Wert, Ohio, is now putting up a new building.

R. L. Graham Ice Cream Company at Lima, Ohio, is now in their new building. It is an up-to-date plant.

Thos. Ammer is now running the Seneca Dairy Company and manufacturing ice cream at Fostoria, Ohio.

Dickson Creamery Co. of Mansfield, Ohio, is in hands of a receiver.

E. G. Neumeister of upper Sandusky, O., who operates a bakery and ice cream plant has remodeled his building and has one of the finest retail stores in the state for a town of its size. It is very cozy.

Albert Joseph, Upper Sandusky, O., has made extensive improvements in his ice cream plant, also his retail store. Albert has a very fine store.

The Crane Ohio Ice Cream Company, Columbus, O., is enlarging its office and making other improvements which are very good and helps handle their large increase of business.

John Kruse, formerly with the Cloverleaf Creamery at Huntington, Ind., is now manager of the Sunlight Creameries plant at Washington C. H. O. He should be proud of having such a plant to manage, for it is a very fine place and up-to-date, with fine new buildings and offices.

The Association of Ice Cream Supply Men

Sub-Committee of
The Board of Directors
on Trade Publication Conditions

Special Bulletin to Members

The Board of Directors of The Association of Ice Cream Supply Men has instructed the Sub-Committee on Trade Publication Conditions officially to discountenance the seeking by advertisers of indiscriminate and unjustified free publicity in trade publications, and the provision of such publicity by trade publications.

Such free publicity is variously designated "write-ups," "puffs," "reading notices," etc.

Investigations by the Sub-Committee lead to the belief that some advertisers persistently request such free publicity, going so far as directly or by implication making the provision of this free publicity by trade paper publishers a condition to the making of advertising contracts; and to the belief that some publications may now proffer or have proffered free publicity of this character as an inducement to the making of advertising contracts.

Whether such free publicity is sought or proffered in this manner, or independently of the making of advertising contracts, its seeking by supply houses and provision by publications are both discountenanced.

Blatant "reading notice" publicity of this description is against the spirit of the laws of the land. The intent of postal laws and regulations is to classify such publicity as advertising, whereas in practice no such publicity appears as advertising but is ostensibly disinterested news.

It is against accepted ethical practice in publishing and advertising. The American Association of Advertising Agencies opposes free reading abuses. The Associated Business Papers, Inc. requires that its members "refuse to publish 'puffs', free reading notices."

It is not good business for the recipient of the publicity but an attempt to get something for nothing, fallacious in theory and without advantage in results because it builds up an endless sequence of indiscriminate laudation.

It is harmful to publications: "Free reading matter impairs the publication that runs it, and that is always taken into account by the competent advertising agency." (American Association of Advertising Agencies.)

It belittles the intelligence of the ice cream industry.

The Sub-Committee's investigations show that there is a legitimate publicity field for supply manufacturers: accounts, facts, photographs, signed articles, etc., etc., based upon or comprising legitimate news, such news determined not from the point of view or interest of the manufacturer and advertiser, but of the editor and reading trade. Legitimate news and feature material that may originate in the activities of manufacturers and advertisers is not included in the Sub-Committee's discountenancing of indiscriminate free publicity.

Cases of the seeking or proffering or appearance of indiscriminate free publicity, as the term is used herein, by member companies or in member publications of the Association may be reported to the Sub-Committee for such recommendations thereon and transmission for further action to the Board of Directors as may seem proper.

March 10, 1924.

REJOINDER TO PACIFIC CONVENTION SPEAKERS

Editor The Ice Cream Review:

At the Pacific Coast convention of ice cream manufacturers, held in Vancouver, B. C., in December, one of the principal speakers (who incidentally represents some very advanced thoughts on the subject of the manufacture and distribution of ice cream) in the course of his remarks laid particular stress on the evils of not properly refrigerating your mix after it comes from the freezers. He spoke about its tendency to grain; about the hole in the center of the can; its liability to settle and jarring while in transit, etc., also of the tendency on the part of some manufacturers to attempt to saddle the responsibility for such conditions on the quality of the time or carelessness of plant management.

The writer has read the above address with a great deal of interest and, while he agrees with the criticism in general, regrets that the speaker neglected to follow out his thesis to a logical issue; which would not only have made the address epochal in character, but would have driven home to the manufacturers in attendance the importance of correcting this evil, which, as the writer sees it, is of cardinal importance for this reason: that many of the disagreeable conditions of the ice cream industry are based on this indifference to first establish the overrun produced by the freezers, by submitting the finished product to a sufficient amount of hardening room temperature to insure its stability not only while in transit but after it reaches the hands of the dealer.

The writer has had many years of experience (mostly technical) in and amongst the manufacturers and contributors of ice cream; has witnessed and participated in its developments from the original ice and salt machines up to the present form of refrigeration, and has helped to work out the development of present large type freezers in order to produce desired overrun on a properly finished product, etc., and amongst the many complicated details incident to such a career, the one that seemed the most serious to him was trying to figure out why the wholesale manufacturers of ice cream had to carry over so many of his customers (financially) from season to season.

I finally ran the subject down with the following results: I discovered that many of the wholesale dealers, particularly in the peak of the season, didn't attempt to harden their cream in the hardening room, according to schedule, as they hadn't the time; and that many of them were forced through lack of facilities to take the mix right from the freezer, which produced about 100 per cent overrun, pack it in tubs with ice and salt and send it on its way to the dealers; figuring it would harden up on the way. Can you fancy the result to a poor dealer; many of whom are accused of being not only poor business men, but in some cases dishonest. Can you fancy how much ice cream he succeeded in distributing out of a five gallon can of mix, handed to him in that condition, and can't you see the principal reason why the wholesaler can't get his accounts cleaned up at the end of the season?

That is the important feature that our friend, speaker at Vancouver, overlooked in his criticism of lack of

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

hardening, etc. I claim that while it's important that we build our freezers in such a manner as to enable us to produce the swell or overrun, as that is one of the features which adds to the palativeness of commercial ice cream, and makes it a wholesome, easily digested dish (particularly during the heated spell) it is also very essential that, in order to keep the product in proper condition and incidentally to give the dealers a chance to serve it out in good condition (without suffering the loss of swell by improperly refrigerated products, which eats up his profits so he can't pay his bills) and that the ice cream manufacturer take every precaution to see that each and every batch of ice cream produced at their plants be checked in and out of his hardening rooms, in such a positive manner that the overrun put into the mix at the time of freezing will be refrigerated into it in such a manner that it will not only correct the evils stressed by our friend at Vancouver, but will also enable the manufacturer to do business with his dealers in more conscientious and satisfactory manner to all concerned.

Overrun in ice cream (commercial) should be submitted to the hardening room temperature (zero to ten below) for at least twenty-four hours, in order to insure its stability—this fact is more essential during the peak of the season than any other time of the year. Unless you can comply with these requirements you are not doing justice to yourself as a manufacturer—to your product or to your dealers and customers.

JUSTIFY.

YOU ARE WELCOME, FRIENDS.

BE IT RESOLVED that the Michigan Dairy Boosters at their annual convention held at Kalamazoo, Michigan, February 4, 5, 6, and 7, 1924, unanimously extend a vote of thanks and appreciation to The Olsen Publishing Company, Milwaukee, Wis., for the printing, publicity and many other courtesies extended to the Boosters during the past year.

SAYS J. B. PORTER "INVENTED" WORD SUNDAE.
Credit Given to President of Oklahoma Association by
one Correspondent, who says Mr. Porter First
Advertised Sundaes, in Pittsburgh.
Review Pulled Reply.

J. B. Porter, president of the Oklahoma Association of Ice Cream Manufacturers, was the "inventor" of the who finds him "all the Hydrox ice cream they can eat."

J. B. PORTER.

nouncement of the offer in The Ice Cream Review.

The "pulling" power of The Ice Cream Review was well demonstrated when Mr. Marshall promptly answered the query of the Hydrox Co. a few days after reading an ice cream sundae. At least, so says J. L. Marshall of the Purity Ice Cream Co., Tulsa. Mr. Marshall was writing in reply to the advertisement of the Hydrox Corp., Chicago, which firm has offered to give the originator of the sundae a hundred dollars in gold and the man

The letter in which Mr. Marshall gives Mr. Porter credit for originating the word "sundae" follows:

Tulsa, Okla., Feb. 4, 1924.

Hydrox Ice Cream Corporation,
 Chicago, Illinois.

Gentlemen:

Answering your advertisement for the man who "invented the ice cream sundae," beg to give you the facts in full.

J. B. Porter, Tulsa, Oklahoma, 1336 S. Boston Ave., president of the Purity Ice Cream Company, was the first man to use and advertise Ice Cream Sundae's.

Mr. Porter was manager of the Kaercher's Pharmacy, Fifth Avenue and Neville Street, Pittsburgh, Pa., and in 1896 or 1897 the word originated. Some thirty or more students from Shady Side Academy were accustomed to spend their noon hour at this store, and being of an unmanageable age and hilarious disposition, they took delight in tormenting everyone within reach.

It was their custom in ordering ice cream to call for 'College Ice,' (as it was then known by,) or 'glace,' with the name of the fruit or flavor wanted, and for several to order at the same time and so cause the clerk to become confused and sometimes make an error in change, always of course to their advantage. On one such occasion the clerk evidently mixed the conversation with reference to Sunday affairs with the order and inquiringly repeated it as 'Sundae.'

The boys thought it a good joke and had a good time over it. Mr. Porter heard the conversation and made a sign advertising 'Chocolate Sunday's,' which was later changed to cover fruit sundaes and flavors. This sign was made with a rubber stamp printing outfit. A few customers objected to the sign with reference to the Sabbath and then they spelled it 'Sunda,' which was later spelled in three endings, viz.: 'y,' 'a' and 'ae,' but by next season practically everyone had adopted the ending 'ae.'

The boys from the academy scattered to practically all the larger colleges and the name was carried with them. These facts can be verified, as the majority of the men referred to are still in business and possibly some of the boys remember the circumstances. Among the boys was a son of Chancellor Holland, and among the younger boys, two sons of Senator P. C. Knox.

Am very sorry that I do not live in or near Chicago to enjoy all the Hydrox cream sundaes that I could eat for a year, but am glad to give you this information for your contest, as I thought that it was very interesting when I first heard it.

Yours very truly,

L. J. MARSHALL,

Salesman, Purity Ice Cream Co.

QUESTIONNAIRES ON DAIRY MANUFACTURING.

Schedules were mailed to all dairy manufacturers by the Bureau of the Census on January 2nd. Only 30 per cent of the manufacturers had forwarded their reports to the bureau on January 31, according to announcement to the Olsen Publishing Company.

The director of the census is very eager to secure all the reports at a very early date, that the statistics may be published much earlier than in previous years and also eliminate the necessity of sending agents to collect the reports. This is, of course, in accordance with the economy schedule of Congress.

Manufacturers, therefore, are urged to prepare and forward reports to the bureau immediately.

New District Association Formed in South-east. Educational Work Planned

It is my pleasure to advise that the following program for entertaining the Southern ice cream manufacturers at the annual convention to be held in New Orleans in November, 1924, has been submitted to the officials of the association for their approval:

Friday, November 14.

Dance and Entertainment at Shrine Mosque.

Saturday, November 15.

Noonday Entertainment and Luncheon for Ladies.

Sunday, November 16.

1 day boat ride on Mississippi River to a sugar plantation—the visitors will witness the entire process of cutting and grinding of sugar cane, as well as the manufacturing of sugar. Luncheon, refreshments and music will be provided on the entire trip.

I desire to call your attention to the boat ride, which, I doubt, will prove of great interest to the visiting ice cream manufacturers as well as supplymen—furthermore, the Dixie Flyers most cordially extend an invitation to members of the national association to be their guests on this very delightful as well as instructive trip.

Further details will be sent you at a later date in order that all visiting ice cream manufacturers can arrange to arrive in New Orleans in sufficient time to join in the day's pleasure.

Yours very truly,

H. A. BENNERS, President.

ORGANIZATION OF CUMBERLAND ICE CREAM MANUFACTURERS' ASSOCIATION.

Ice cream manufacturers, representing southeastern Kentucky and territory immediately adjacent in neighboring states, met at the Cumberland Hotel, Middlesboro, Wednesday, March 19th, and after a dinner at 7 o'clock elected an organization to be known as the Cumberland Ice Cream Manufacturers' Association, and whose purpose is to promote the ice cream industry by proper educational development and also maintain the high moral standards so necessary in the healthy growth of the industry.

A constitution and by-laws were adopted, and directors and officers elected for one year, as follows:

Directors: D. A. Harkness, Jellico, Tenn.; L. M. Miller, Pineville, Ky.; H. R. Smith, Harlan, Ky.; J. S. Ney, Middlesboro, Ky.; W. N. Scoville, London, Ky.
Officers: Treasurer, F. E. Hess, Middlesboro, Ky.; Secretary, Carlton Ball, Louisville, Ky.

Regular meetings will be held every two months, rotating from one town to another. A different chairman is to be elected at each preceding meeting. Pine-

ville will be the next town where the ice cream men will convene, and L. M. Weller was chosen as chairman.

In addition to organization matters, many problems peculiar to ice cream manufacture in the way of legislation, publicity and transportation were taken up. J. O. Bellah, of the American Railway Express Company, was present at the dinner and later spoke at the meeting on express service questions. An outside speaker is to be invited to address the association at each of its meetings.

IT'S A GIRL.

Mr. and Mrs. R. S. Jennings of Atlanta have announced the arrival of Margaret Virginia, weighing eight pounds. Rather, the announcement was issued by little Miss Margaret Virginia herself on a card which stated that the population of the United States is 110,000,000 people—"and me." Mr. Jennings represents the Creamery Package Manufacturing Company in the Southeast. He has covered the Southern territory for many years.

News From Far and Near

CALIFORNIA

FLORIDA

Fort Smith, Ark.—The Watson-Aven Ice Cream Company and its property here was purchased by Joe N. Ward, owner and manager of the Ward Ice Company, according to announcement. The entire plant will be overhauled and enlarged and manufacturing of ice cream and other products at the plant will be done on a much larger scale than formerly.

The Watson-Aven company's headquarters are maintained at Little Rock, and branch houses are operated in several cities in the Southwest. The plant which is now occupied here is comparatively new, the Watson-Aven company moving from a plant on Rogers Avenue to its present quarters on North Eighth Street less than two years ago. A. E. Drew is present manager.

Jonesboro, Ark.—The Scott Ice Cream Company of this city, has remodeled its plant and added new machinery.

Walnut Ridge, Ark.—New equipment valued at \$5,000 has been added to the Moore Ice Cream Company.

Hartford, Cal.—L. W. Wilson of the Benham Ice Cream Co. of Fresno completed negotiations with city trustee G. R. Smith for the purchase of four lots on E. Seventh St.

San Francisco, Calif.—A new branch of the West Side Creamery Co. has been opened as the Vogue Ice Cream Company in San Francisco, Calif. A regulation in the latter city makes it impossible to transport ice cream from the Tracy branch.

San Francisco, Calif.—The Acme Ice Cream Company has increased its capital stock of \$1,000,000 to \$2,000,000, and has filed amended articles of incorporation. The new directors are B. M. Gunn, J. C. Hughes, E. O. Lindbloom and C. O. Swanberg.

Springfield, Ill.—Capital City Ice Cream Company, 312 South Third street, has incorporated with a capital of \$75,000. Incorporators are Charles S. Dines, R. Albert Guest, Oscar F. Schulze.

Plymouth, Ind.—Improvements are under way at the Plymouth plant of Schlosser Brothers which will make possible the doubling of the ice cream output—an increase to 100,000 gallons a year. In order to accommodate the new equipment the interior of the plant is being remodeled. The new apparatus will include larger vats, more testers, etc.

Clarion, Ia.—This town will have a new ice cream company, known as Hutchinson & Company of Cedar Rapids, and will use the Clarion creamery as headquarters for Wright county and adjacent territory for the distribution of ice cream. The company has purchased Mr. Anderson's supply of ice and will send a man and truck to make deliveries over this territory.

Clinton, Ia.—Banta's ice cream factory is now housed in the commodious new building on the north side of the Lincoln Highway. The building is 42x80, two story and basement, constructed of hollow cement blocks and tile, making the structure absolutely fireproof. The very large front windows and liberal number of windows on the three remaining sides insure an abundance of light and air, rendering the working conditions the best possible. On the main floor are the sales room and office. At a small elevation is the "daylight room" or main work room with six large win-

dows. The freezing vat has a 2,000 gallon capacity. Two elevators run to either basement and second floor. There are six motors in the building and every facility is provided for the manufacture of ice cream under the most sanitary conditions.

Des Moines, Ia.—A deal was closed recently whereby Joe Hutchinson of Des Moines becomes the owner of the Perry Artificial Ice and Storage Plant. The new owners will have full charge of the local plant and will continue the manufacture of ice and ice cream. Ivyl Collins who has been with Mr. Paul for several years as foreman will remain in the same position for the new firm.

Shreveport, La.—The Campbell Ice Cream Company has announced that the plant will be greatly enlarged during the coming year.

Topeka, Kan.—J. C. Webster has opened an ice cream cone factory at 523 Jackson St., where he has equipment for producing 80,000 cones a day.

Wichita, Kan.—The Wichita Creamery Company has begun making ice cream at its new plant on North Handley Street. The plant cost \$40,000.

Lexington, Ky.—A permit to build, at a cost of \$18,000, an ice cream factory adjoining the present factory at 503 East High street has been issued to Hughes & Company. The new building will be a companion building to the present factory, erected several years ago. When the new building is completed the company will be able to increase its output several hundred per cent, according to a member of the firm. The company expects to produce at least twice as much ice cream in the coming summer as it did during the summer of 1923, Mr. Hughes says.

Mansfield, La.—The Crystal Ice and Bottling Company are erecting an ice cream factory in South Mansfield, to be operated in connection with their ice plant. The work of constructing the buildings is under way, and the plant will be ready for operation by April 1. D. J. Cook, manager of the Crystal Ice and Bottling Company, with plants here and at Natchitoches, is the promoter of the new enterprise.

Baltimore, Md.—G. and M. L. Lang will erect a one-story, brick, ice and ice cream manufacturing plant at 2858 Pennsylvania Avenue to cost \$30,000.

Brockton, Mass.—Lothrop Hedge has purchased the business of W. A. Wilcox. The latter has maintained a profitable wholesale ice cream and confectionery business in that city for many years.

Charlestown, Mass.—Fire in a one-story building at 45A Cambridge St., occupied by Quality Ice Cream Company, caused damage of \$3,000. The building was owned by Mary Cuneo.

Clinton, Mass.—The Ideal Ice Cream Co., with plants in Clinton, Fitchburg and Leominster, Mass., will erect two new buildings at Clinton, Mass.

Flint, Mich.—The Freeman Dairy Company has announced the purchase of the equipment and business of the L. C. Wipp & Sons ice cream plant. The deal becomes effective March first.

Lansing, Mich.—A better grade of ice cream probably will be manufactured in Michigan cities this year as a result of rules and regulations governing the manufacture and sale of this dairy product. The rules were promulgated by the state department of agriculture and are effective immediately.

T. H. Broughton, director of the state bureau of dairying, has instructed his inspectors to check up on the construction of ice cream plants and see if they comply with the new regulations.

The rules prohibit any manufacturer employing any person suffering from any disease. Employees are forbidden to smoke while at work in the factories. All utensils used in the manufacture of ice cream must be sterilized with steam or scalding water.

St. Louis, Mo.—The Blue Ribbon Ice Cream Company has filed articles of incorporation with the Secretary of State. The company shows a capitalization of \$30,000 and will operate an artificial cold storage plant for the manufacture of ice, ice cream and other soda fountain products. The incorporators are Eugene Seltzer, Esia Seltzer and Sam Grossman.

Poplar Bluff, Mo.—The Woodburn Ice Cream Company is preparing to merchandise a new product. It is in the form of a new brick ice cream and is described as a layer of ice cream, a layer of lady fingers and fruits and a layer of whipped cream. The brick already is popular in the Missourian-Arkansas territory that the Poplar Bluff company serves.

Trenton, Mo.—J. T. Riggs has purchased the Foster Ice Cream Factory. R. A. Salisbury, a graduate of the Iowa State College dairy department, with three years' practical experience as an ice cream maker, will hold that position under the new management. C. A. Foster, the retiring

owner, has not announced his future plans but may continue in the ice cream business.

Batavia, N. Y.—The Batavia Ice Cream Co. has been organized with a capital of \$75,000. W. and C. L. Fargo are the organizers.

New York City—Aurora Ice Cream Co., Bronx, has incorporated with 1,500 shares common stock, no par value. W. Blingit and P. E. Haebler are the incorporators.

New York City—The Arctic Co. has been organized with a capital of \$1,000 by H. & H. Hoffer for the manufacture of ice cream, etc.

Charlotte, N. C.—Through stock control J. A. Yarborough, president of the "Y. B." corporation, announces that his company has taken over the Mecklenburg Ice Cream and Dairy Company.

The Mecklenburg company has been a very successful concern, manufacturing ice cream and dairy products, while the "Y. & B." corporation has been in the manufacture of ice and dealing in wholesale and retail coal in Charlotte for the past 25 years under the present management of J. A. Yarborough.

Mr. Yarborough says that the taking over of the Mecklenburg properties is in line with the expansion program of the "Y. & B." corporation. He says his company contemplates erecting on the site of the present Mecklenburg plant one of the most modern and sanitary ice cream plants in the South.

Moorestown, N. C.—The Moorestown Ice Cream Co. has been incorporated by Charlie Mack, E. F. Francis and others, with a capital of \$50,000.

Coshocton, O.—Connors ice cream plant has installed new ice crusher, new ice cream freezer and 6-ton ice machine.

Mount Vernon, O.—Ice cream manufacturers from ten counties in central Ohio recommended the proposed federal standard of ice cream be made the same as that in Ohio which calls for a minimum of 20 per cent total milk solids, of which at least 8 per cent must be butterfat. A district organization was formed with L. L. Monteil of Marion as chairman and R. M. Jewell of Mt. Vernon as vice-chairman.

Napoleon, O.—The Heckler Company manufacturing ice cream and soft drinks sold out to J. F. Cuff.

Steubenville, O.—Steubenville Pure Milk Co. will soon begin to manufacture ice cream. They have installed a complete new ice cream plant and will put out a high grade product.

Guymon, Okla.—What was known as the Guymon Ice Cream and Cold Storage plant burned recently. S. P. Swan is owner. \$6,000 insurance was carried.

North Bend, Ore.—The Cutlip Ice Cream Company has stalled new equipment at a cost of \$8,000 during the last month. The firm is one of the most complete ice cream refrigerating plants in southern Oregon.

Delta, Pa.—An ice cream plant will be built on the lot of Delta Motor Co. It will be a valuable industry.

Kittanning, Pa.—Officials of the Elk Brewing Company announce that the Reinhold Ice and Ice Cream Company of McKeesport, Pa., had closed a four year lease, with a privilege to buy the brewing company's ice plant on Oak Avenue.

Middletown, Pa.—A. S. Light, who some time ago purchased the Witman building on Ann Street, has started in operation his new ice cream plant, which has a capacity of one hundred gallons per hour, with no ice or salt used in the manufacture or keeping.

The new plant has been installed and equipped with the best machinery, electrically operated, at a cost of \$12,000. An artesian well has been sunk at the rear of the plant and fresh well water is pumped from it.

In the trial test of the new machinery, 175 gallons of ice cream was frozen in two hours.

Two cold storage rooms have also been installed and are kept at a zero temperature all the time. The cabinet in which the ice cream is kept for serving in the ice cream parlor also is connected with a cold storage system.

Philadelphia, Pa.—Nallin-Coleman Ice Cream Company has been formed to manufacture ice cream; capital stock, \$10,000. Organized by Joseph F. Coleman.

Philadelphia, Pa.—The entire ice cream cone warehouse, located at No. 1738 South Nineteenth Street, and owned by the Evangeliste, was destroyed by fire when a match set fire to paper cartons in which the cones were packed. The building burned to the ground.

Philadelphia, Pa.—On March 24, 25, 26 and 27 was held the ice cream dealers' convention under the direction of the Greater Ice Cream Company of this city. There were two meetings each day.

Pittsburgh, Pa.—Made Good Ice Cream Company has organized with a capital stock of \$200,000; treasurer, G. M. Morris, Lansford, Pa.

To Launch National Cone Week Next Month

Nation-Wide Educational Campaign Planned to Create Proper Appreciation of Cone as a Food Companion to Ice Cream Instead of Merely a Holder

AN AGGRESSIVE effort to encourage greater consumption of ice cream through spreading proper appreciation of the cone as a food companion to the ice cream with which it is served will be carried out next month with the observance of National Ice Cream Cone Week. Memorial Day, May 30, has been set for the official launching of a cone campaign throughout the industry.

The idea of National Ice Cream Cone Week, originating with the Minnesota Ice Cream Manufacturers' Association late in February, has spread over the country, with the result that ice cream manufacturers and the cone people are co-operating to help the dealer boost the consumption of ice cream in that week, at the same time spreading educational matter that will assure continued popularity for the cone.

Window strips calling attention to the event will be distributed among dealers. Cone literature will be distributed. The event will be advertised in local newspapers.

For the last several years Memorial Day has been seized upon by ice cream manufacturers as an occasion for staging float parades depicting the appeal of ice cream. This has been the industry's nearest approach to a concerted demonstration. The bakers, candy manufacturers and members of other food industries have set aside certain weeks in which to boost their product. The ice cream industry has been looking forward to ice cream week, and some manufacturers believe that National Cone Week will be a stepping stone in this direction.

The purpose of the campaign is to teach the public that ice cream is good and wholesome and that when served in an ice cream cone, it has an added food value as well as being more appetizing.

Since the advent of the cone, a score of years ago, the public has been prone to accept it as merely a handy container for ice cream, and it is the aim of the ice cream men to teach consumers that the cone is a part of the treat, has food value and is more digestible than the usual run of cake.

As this issue of The Ice Cream Review was about to go to press, arrangements were being made for a meeting of cone manufacturers in Milwaukee to discuss means of co-operating with ice cream manufacturers in putting over National Cone Week.

The candy people's slogan is, "Remember—Everybody Likes Candy." They boost candy as a gift, not stressing the food value. Ice cream men feel that several points can be stressed for ice cream and the ice cream cone that other food industries do not play up. The cone is a food. It is just as delicious as any produce of the bakers, and served with ice cream it is more toothsome than candy. Different ice cream men with whom The Ice Cream Review has been in correspondence believe that when the public is made to understand that the cone is prepared as a toothsome product to accompany ice cream just as cake often is served with ice cream, there will be greater appreciation of the ice cream cone and more interest in ice cream.

ICE CREAM SALESMANSHIP TAUGHT AT DEALERS' CONVENTION.

Self-Carbonating Soda Fountain Co.
Havacone Company.
Gearhart Sales Cabinet Co.

In an effort to interest the dealers in package ice cream the Gearhart Sales Cabinet Co., Inc., of Clearfield, Pa., offered to give away the 13½ gallon capacity selective sales cabinet on exhibit in their booth to the dealer writing the best essay on the subject, "Package Ice Cream and Its Advantages for the Manufacturer, Retailer and Consumer."

SOME idea of the magnitude of the Breyer company business and size of the new plant, which will be operated in addition to the original plant, can be gleaned from the following figures which were given out during the convention:

Capacity of No. 1 plant, 28,000,000 quarts annually.
Capacity of No. 2 plant, 56,000,000 quarts annually.
Total capacity, 84,000,000 quarts.

The company operates in Philadelphia alone sixty-five motor vehicles and seventy-five horse-drawn vehicles.

Plans are now being made to operate at least ten refrigeration express cars so that it will be possible to deliver to practically any point in the East, the first thing in the morning, cream that is made the previous afternoon.

Cherry Brine Freezers

Are usually found where good Ice Cream is made. Those manufacturers who seek to dominate the trade and to produce the finest quality at low cost, always turn to Cherry freezers.

Freezers which cost no more than others, yet which are easier to clean, cheaper to operate and which provide abundant over-capacity are naturally popular with manufacturers—consequently, it is not surprising that Cherry freezers are universally adopted as standard by large and small manufacturers alike.

*In buying, the Seal for
years has stood for Safety*

IN ALL industries today the effort is toward a sounder economy — that economy which is the “disposition of the parts or functions of an organic whole.” . . . The ice cream manufacturer’s path to the public for his product is the dealer. His path to the adequate provision of equipment and supplies, the origination of new methods and devices and the development of vital processes, is the supply house. . . . A sound industrial economy of ice cream is that in which the manufacturer accords to, and demands from, the men and companies along both these paths, true *business* relationships.

MAY 1924

OUR READERS will be particularly interested in the announcement by Secretary Little, of the International Association of Milk Dealers, relative to standardized sanitary pipe and fittings, which is published in this issue. As Mr. Little points out, the manufacturers of sanitary pipe and fittings have shown a splendid spirit of co-operation in eliminating a real nuisance in the dairy products manufacturing business and the least they are entitled to is the hearty support of every ice cream manufacturer, milk dealer and creameryman in the future. The change has cost them many thousands of dollars and this money will be lost to the industry unless our standard pipe and fittings are specified in the future.

Mr. Little and the men who worked with him so long and so earnestly on this problem are entitled to the gratitude of the entire industry.

WE GOT the "kick" all right. In a recent issue we told you we get a lot of fun out of this job. Now, what can please an editor more than to get evidence that somebody somewhere is reading what he publishes? It makes him feel just like you do when Mrs. Highsociety calls you on the phone Monday morning and tells you that your "Sunday Special" was just about the very best ice cream she ever served in her home.

In that issue we told you that it is fun to go through the big pile of morning's mail because we seldom fail to get a "kick" out of it, and many a hearty laugh. A big ice cream manufacturer in a Southern city, whom you would all know if we were privileged to use his name, wrote us as follows:

The April number of The Ice Cream Review received, and if I wasn't interested and enjoyed every bit of it there would be no need of this letter.

Want to compliment you on the fact that you have increased the number of "Editorial" pages. These little heart to heart talks are really very good for the soul. The one in particular about getting a lot of fun out of your work, certainly appealed to me. You know that just a year ago I disposed of my business at ———, firmly resolved that I had had about enough of the so-called seven day a week grind, and by the way I can go back quite a few years, to the days when the ice cream business was a whole lot different than it is today. Well, to make a long story short, I never put in as miserable a summer as I did last year, and before the season was well advanced I had made arrangements for connections with my present firm. And once more I am happy, for I sure get a "kick" out of the work, and have firmly resolved that come what may, when old St. Peter issues his call for me he will find me hard at work with my "First Love," and that's the ice cream business.

This letter is not for publication, but just to let you know that some of us are human, and certainly appreciate your efforts.

Yes, friends, the most of us are "human." We may surround ourselves with a lot of false dignity, and try to make ourselves believe that power and position can only be obtained or retained at the expense of homely virtues and innocent fun, but we don't fool anybody—not even ourselves. The man who thinks that he is more than a boy grown up, and who is afraid to let the world know that he craves the same pleasures that filled his youth, is mightily handicapped.

Men in the ice cream business, or in any other branch of the dairy industry, should find little trouble in being very "human." The dairy business depends upon the dairy cow—the mother cow—and motherhood is the most "humanizing" influence in all the world.

OURS is an age of mechanical perfection. But all the machines in the world are of little avail if the product manufactured hasn't that appeal that makes the public want it in large quantities.

Quantity production has been developed to the highest degree in America, but in late years the initiative has been toward quality production. The farther we advance in industry the better we learn that real quantity production hinges very greatly upon the quality of the output.

NATIONAL Ice Cream Cone Week will be observed the week of June 9. It is felt sure that manufacturers of the country will give their heartiest co-operation in putting over this drive to teach the public something about the ice cream cone and its importance as a good carrier of America's greatest food dessert.

Associations of ice cream manufacturers in all parts of the country have pledged their co-operation in observing National Ice Cream Cone Week. The idea began among the wide-awake manufacturers of Minnesota, who wasted no time in getting the support of others, including the cone manufacturers, who in turn wasted no time making preparations to assist the ice cream manufacturers in this movement.

Thus it seems that the ice cream cone is coming into just recognition. Probably no other agency, with the sole exception of the quality of the ice cream making, has contributed more to the development of the ice cream industry than the ice cream cone. It made its debut, as the ladies and gentlemen of the society might say, about twenty years ago, at a time when the industry was hardly well started. As attesting its usefulness at the outset the ice cream cone has continued to grow in popularity and has been the means of getting much more ice cream from behind the dealers' counters than otherwise would be the case.

But even now the cone is not properly appreciated; it is not generally understood that it is an appetizing food product, especially recommended for consumption with ice cream. The purpose of Ice Cream Cone Week is not alone to give the public a better appreciation of the ice cream cone, but also is to instruct the dealers in the good qualities of the cone so they in turn can know the value of the goods they are merchandising.

ADVERTISING is coming into its own in the ice cream industry. The present interest being shown in advertising ice cream to the public is bright assurance that this industry is facing avenues of expansion. The National Association of Ice Cream Manufacturers has reason to be well satisfied with results of its national campaign for a suitable slogan for the industry. Though it is too early at this time to vision what will be the ultimate impress upon the public, this campaign

was worth many, many times the \$4,000 it cost the association if nothing more than for its success in getting the ice cream manufacturers to join in a co-operative movement for common good.

It is felt sure that the slogan campaign reached many people and caused them to do some earnest thinking regarding the best qualities in ice cream. This interest, no doubt, will bring many, many new customers to the ice cream industry. One of the really important features of the slogan campaign is the way it has impressed ice cream manufacturers in all parts of the country with the value of advertising. There never was a time when so much thought was being given to telling the ice cream story to the public instead of just to the dealers.

The ice cream manufacturing industry at last seems to have launched forth upon a highly intensive merchandising career.

He's Ready for National Ice Cream Cone Week.

at all times. For a long time The Ice Cream Review has served as the official organ for most of the state and regional associations, some of them among the largest in the industry, but we are just as proud of the new-comer as any other member of our family.

THE ice cream industry of the Middle Atlantic states is featured in this issue. We are sure our readers will enjoy reading of the achievements of men who have put their states at the very top in ice cream production. Pennsylvania, New York and New Jersey have gone far in the upbuilding of the ice cream industry.

It is good to study what has been done in these states, and that is the principal reason for featuring the industry in different states, as we now are doing, having discussed the New England industry in the preceding issue. Ice cream manufacturers in one part of

NEW honors came to The Ice Cream Review when the Colorado Association of Ice Cream Manufacturers, at a special meeting at Pueblo late in March, named this publication its official organ. It is with great pride that we add the name of this young but vigorous organization to our family list. We are expecting great things for the Colorado association, and we want our friends in that state to know that our co-operation can be counted upon

the country do not know enough about what is being done elsewhere. Most of us have a habit of falling into the idea that we are doing all we can to better conditions in our business. It is not till we note what other men are doing that we begin to realize how many different things we really can do to make people eat more ice cream.

ICE cream manufacturers stand on the threshold of a new line of activities with the general tone of business much stronger than has been the case in several years. It seems a very short time ago when all of us raised the cry, "Back to normalcy." This meant different things to people, and it may be that some of us, expecting too much of a world made up of human beings, still are waiting for some kind of spectacular rising tide of prosperity.

Years and years after you and this writer have passed on to whatever rewards are in store, someone still will be talking about wanting things to get normal again. Few of us can recall a time when conditions impressed us as being completely normal, though many people like to think that back in the days of such-and-such a period a business man knew where he stood. But if you devote yourself to dispassionate reflection, you are sure to recall that at that time you were just as wary of conditions then as you are now, and were looking just as earnestly into the future for a brighter day in the sweet bye and bye.

Looking to the future and hoping for the coming of better things to business should never be discouraged, but in looking forward at this time, the ice cream industry will do well to represent to itself that much of that happy condition of stability to which we looked forward some time ago, now is at hand. It has been a slow but steady climb, and at last America is back to normalcy. And no matter how many good things you see in store for business in the future, the only business in the world that means anything to you now is that business which is before us and waiting for us to make the effort to develop it. It must be remembered that business doesn't develop with the unfolding of years; it has to be developed by effort.

ARICH and informed human experience with matters of trade and finance prevents one from forgetting the inflexibility of laws. Men are bound by laws, live by laws, work by laws, do business by laws, and die by laws. All of them are not written. There have never yet been any that could be laid down as a fixed and set road to success, though all of us know there are many laws which we cannot break without bringing about ill health, unproductive work and sometimes early death, in the case of laws of nature, and business disaster in the laws of trade.

We would be very near the long-sought royal road to success if anyone could lay down a code to tell business men to do thus-and-so and reap a whirlwind of riches.

Ask a successful ice cream manufacturer how he

made good. If he is a good-natured gentleman, he will begin to tell you that he went to work to make a quality product, then advertised considerably, and worked hard—very hard.

Then further to make yourself informed upon matters of trade success, seek out a manufacturer whom you know has been on the ragged edge of failure for many years, and ask him what lines he has followed in business. He is sure to tell you he began with a quality product, then considerable advertising, and lots of hard work. The strange and interesting part of it all is, the latter will be in earnest. He really believes he is following those principles. What is still more perplexing, this man on the verge of ruin might have done exactly that.

Business is something more than a cut-and-dried operation. In the manufacture of ice cream, a business peculiarly involved, hardly anybody knows anything about the cost of operating. Some of us make money in spite of this ignorance, while others have not the intuition to stay close enough to the balancing line of income and outgo. The result is disastrous to some and is the principal reason why there are not more large ice cream institutions in the country. Much of the industry's wealth, hundreds of thousands of dollars, is slipping away because of this ignorance.

A golden era will be near for the ice cream industry when we learn not only a few laws of business, but also something about **how** to follow them—**how** to advertise, **how** to make a quality product and **how** to convince the public to that effect.

Some of the most dismal failures this world of sorrow and sunshine ever saw were men who worked pitifully hard, but without understanding.

BULLETIN OF EVENTS

National Cone Week—Week of June 9, to be observed nationally with the co-operation of associations of ice cream manufacturers and the assistance of the Cone Manufacturers' Association. Secretary, the Cone Manufacturers' Association, 501 Cherry St., Milwaukee, Wis.

National Dairy Exposition—Wisconsin State Fair Grounds and the City Auditorium, Milwaukee, September 27 to October 4. Secretary, W. E. Skinner, 910 South Michigan Ave., Chicago.

Southern Association of Ice Cream Manufacturers—Twelfth Annual Convention, New Orleans, November 14 and 15, 1924. Secretary, J. W. Clopton, Decatur Ice Cream & Creamery Co., Decatur, Ala.

National Association of Ice Cream Manufacturers—Twenty-fourth Annual Convention, New Orleans, La., November 17, 18, 19 and 20, 1924. Secretary, N. Loewenstein, 155 N. Clark St., Chicago.

Texas Ice Cream Manufacturers' Association—Annual Convention, Dallas, first week in December, 1924. Secretary, A. J. White, San Antonio.

Oklahoma Association of Ice Cream Manufacturers—Annual Convention, Tulsa, December 8-9-10. Secretary, W. M. Hawk, Tulsa.

Pacific Slope Dairy Show—Exposition under the auspices of the California Dairy Council with co-operation of dairy councils of the Western states and dairy divisions of the agricultural colleges and departments of the Pacific Coast states, Oakland, Cal., December 10 to 16 inclusive. Secretary-manager, Sam H. Greene, 216 Pine St., San Francisco.

Pacific Ice Cream Manufacturers' Association—Annual convention, Oakland, Cal., December 10, 11 and 12. Secretary, Bert H. Walker, Tacoma, Wash.

California & Southwestern States Ice Cream Manufacturers' Association—Annual convention, Oakland, December 10, 11 and 12. Secretary, Jay Kugler, San Francisco.

Supply Men of the Pacific Coast Ice Cream Manufacturers' Association—Exhibition in connection with joint convention of Pacific Northwest, Pacific Coast and Southwestern States, City Auditorium, Oakland, Cal., December 10, 11 and 12.

Georgia Ice Cream Manufacturers' Association—Annual Convention, Augusta, Ga., some time in December, 1924. Secretary, Sam Marshall, Marshall Ice Cream Co., Albany, Ga.

Arkansas Ice Cream Manufacturers' Association—Annual Convention, Little Rock, some time in December, 1924. Convention headquarters, Hotel Marion. Secretary, Charles Hoober, Pine Bluff.

North Carolina Ice Cream Manufacturers' Association—Seventh Annual Convention, Charlotte, January 13-14, 1925. Secretary, A. E. Dixon, Fayetteville.

Getting the Ice Cream Window Ads Over

Many Advertising Stock Rooms Have Atmosphere of Modern Antique Shop

By M. D. ALLEN

"WHAT is new in the way of display advertising matter?" is a common cry of the members of the sales department of any well organized creamery company, and the poor advertising manager sits gloomily in his office trying to think out new ideas for advertising which can be placed to practical use. After inspecting more than twenty-five stock rooms in various creameries it was impressed upon the writer that the problem is not so much one of getting up new ideas for display advertising, as it is a problem of getting rid of the material already on hand. After the inspection was completed, it is safe to say that at least fifty per cent of the advertising material on hand was at least two years old, and in many cases as much as three or four years old. This ancient material was laid away with loving care so no harm could come of it, except the damage done by mice and dust. The advertising manager was prone to state the fact, that "The darn stuff just wouldn't go out, or the salesmen would not take it out;" and in every case the material was good and usually had splendid appearance. Many dealers would have welcomed this material for their stores if they could have gotten it. We had previously talked with the dealers to make sure they were not over-supplied. It was always a case of wanting the display material if they knew where and how to get it. It seemed to be a case of an adequate supply with an inadequate outlet. The dealer actually wanted the display material, but the advertising manager could not move it off his stock room shelves.

I believe that the basic reason for this situation rests with the sales department and sales manager, who, as an organization, are obliged to use every available means to promote new business. Advertising happens to be one of the chief aids and should be used to its maximum efficiency. But in many cases sales departments have allowed themselves to grow into a sense of egotism which practically makes it beneath them to distribute advertising material among their dealers. This false standard has had but one result. The harassed advertising manager has been obliged to distribute the material through his own department or go outside for help.

DISTRIBUTING advertising material should be an important part of every salesman's work. The necessity for keeping his customers well supplied with advertising material should be made a part of each day's business. Rather than looking upon the distribution of this material as a menial task beneath him, the salesman should appreciate the real value and good

friendship which can be acquired through its proper distribution.

"The best salesman on our sales force never gives the advertising manager a rest," said a creamery manager, and he hit the nail on the head. Clever salesmen study advertising just as carefully as the advertising manager does. They become thoroughly acquainted with the current newspaper campaign, its purpose, in what papers it is running, and why it will help to sell more of the products manufactured by their concern; just what the latest display advertising material is and for what purpose it is intended. In fact, clever salesmen sell the merits of their products almost exclusively on advertising. They figure out a formula and talk along this line. Since our company is a better advertised company than our competitors, it is logical to believe that more people know about our products, and will therefore purchase more of our goods.

Timely Advertising Hints

COMING just at a time when ice cream manufacturers are giving more thought to advertising than ever before in the history of the industry—both co-operatively and individually—this is a timely discussion on an interesting topic by a writer who has previously entertained and instructed readers of *The Ice Cream Review*.

From this article by Mr. Allen manufacturers will gain some important hints for getting before the public advertising in connection with National Ice Cream Cone Week, as well as for getting other advertising material brought to the front.

In this article are discussed some matters that have been skeletons in the closets of many ice cream manufacturers for many years. It is timely and interesting. Read it.

NO advertising manager should assume the attitude, "Here it is, why don't you take it away?" for it would be preposterous to assume that a sales department is obliged to move all of the advertising material. The advertising manager should instruct the salesmen as to its purpose and proper distribution. Among the many ways devised, the following is both simple and effective:

Package the advertising display signs according to the class of dealers it is intended to go to. There are three classifications which will prove adequate for all purposes. First class drug and confectionery stores, restaurants and cafes, grocery stores and stands. Secure large heavy manila paper envelopes of a size suitable to

fit the largest display pieces and have the proper classification printed in large letters on the envelopes you will use for each type of display so the salesmen can distribute them easily. Have the envelopes filled with the proper advertising matter for each classification. For drug and confectionery stores the envelopes should be filled with an assortment of the very best material in the stock room. Window strips and window trimming sets should be included. For restaurants and cafes use pie a la mode signs and general ice cream cards, preferably of the hanger type. For grocery stores and stands use only cheaper material, which can be removed constantly.

TO properly decorate a dealer's window is an art in itself, and to expect an inexperienced salesman to know all about window trimming is extremely foolish, but at the sales meetings which every live sales organi-

EVERY MANUFACTURER IN THE COUNTRY SHOULD BE A MEMBER OF THE NATIONAL ASSN. OF ICE CREAM MFRS.

Ice Cream Claims Recognition in the Home

Slogan Campaign of National Association Takes "The Frozen Dish" into the Family Court for Investigation

ICE CREAM was knocking at the doors of American homes and claiming for itself a place on the family table as this issue of The Ice Cream Review was going to press. The slogan campaign of the National Association of Ice Cream Manufacturers, the first co-operative national campaign to be attempted by the industry, had excited the interest of state association officers and manufacturers-at-large in virtually every section. Many associations offered prizes of their own in connection with the prize of one thousand dollars offered by the national association for the best slogan, "not more than six words, easily said and remembered, to express the purity, goodness and food value of ice cream; a phrase

that conveys its year 'round appeal as a delicious delicacy as well as nutritious food."

The significance of this national advertising campaign was pointed out in a bulletin issued by the national association early in April, which declared that the association had a vital meaning—

"First of all, it acquaints the people of the United States and Canada with the importance of your business and the value of your products. Secondly, it provides a concrete means of finding out from your customers just what their thoughts are about ice cream."

"We firmly believe," declared a statement from C. Sutton, chairman of the slogan committee of the national association, "that this slogan contest will awaken a national interest in ice cream which will, both directly and indirectly, help build good-will and increase sales for your own business."

The campaign was not actually to begin until the announcement of the national association could be made in an advertisement in the April 26 issue of The Saturday Evening Post, in which the association asked readers to submit slogans in competition for the thousand-dollar prize. The same ad will appear in the May issue of The Ladies' Home Journal.

After the appearance of the ads members of the national association and of state and regional associations were expected to use reprints of the ads for distribution among dealers, the reprints having been provided in advance.

FIRED with the high purpose of the national association's slogan committee, different state associations early in April took steps to co-operate toward the success of this venture.

The Illinois Association of Ice Cream Manufacturers was one of the first to offer an extra prize for a winning slogan. The executive committee of that association, at a special meeting, decided that the association should add five hundred dollars to the national's prize should the winner of the national prize be a resident of the state of Illinois. Other associations were considering the step at press time for The Ice Cream Review.

W. D. Seale, president of the Mississippi Ice Cream Manufacturers' Association, issued a circular in the middle of April in which he asked his association to provide an extra \$1,000 for the winner of the contest should he prove to be a resident of the state of Mississippi. He agreed personally to underwrite or guarantee the promise of the prize if his members would subscribe.

The New York association offered an additional prize of \$500.00.

The following statement was issued by the national slogan committee in connection with its contest:

(Continued on page 74)

\$10,000.00 for a Slogan

WANTED
a slogan for
ICE CREAM

—to typify its purity and food value

Can you think of a slogan, not more than six (6) words, easily said and remembered, to express the purity, goodness and food value of ICE CREAM; a phrase that conveys its year 'round appeal as a delicious delicacy as well as a nutritious, healthful food.

The National Association of Ice Cream Manufacturers will give \$1,000.00 in cash to the person who submits the best slogan.

Read the rules of the contest carefully and **ACT IMMEDIATELY!** The \$1,000.00 prize may be yours in return for very little time or effort expended.

Who is giving the Prize?

The National Association of Ice Cream Manufacturers is composed of nearly 3,000 members whose plants are located in all parts of the United States and Canada, and whose purpose it is to foster and maintain the highest standards of quality and purity in the making of ICE CREAM.

Today this important industry represents an investment of over \$250,000,000 with an annual production of over 300,000,000 gallons. In your own community, there are makers who supply you with rich, pure, wholesome ice cream. Surely they merit your confidence and your patronage.

National Association of Ice Cream Manufacturers

SLOGAN CONTEST HEADQUARTERS, 235 ELM STREET, BUFFALO, N. Y.

The Association reserves the right to register any Slogan submitted.

Rules of Contest

Contest is open to every man, woman and child in the United States and Canada.

Contestants may submit as many slogans as they wish, but each must be clearly written in ink (or typed) on separate sheets of paper. Each sheet must contain contestant's name and address.

No slogan can be longer than six (6) words.

A letter, not longer than 25 words, must accompany each slogan submitted, explaining its use and application.

This explanation will be considered a part of the slogan by the judges in determining the winner.

Contest closes May 31st, 1924. Slogans received postmarked later than May 31st, 1924, will be declared void.

Prize will be awarded by competent judges; in case two or more contestants submit the winning slogan, the full amount of the prize will be given to each.

Mail all slogans to address stated at left.

OKLAHOMA ICE CREAM WEEK

Ice Cream--Some Way--Every Day

April 28th

Oklahoma Manufacturers Take Up Merchandising

Expect to Boost Per Capita Consumption Through Ice Cream
Week and a Series of Week-end Specials

OKLAHOMA ice cream manufacturers are off on a merchandising expedition which they hope will result in teaching their public something about ice cream as a food product as well as a delicacy. Plans were complete, as this issue of The Ice Cream Review was going to press, for the opening of Oklahoma Ice Cream Week, a movement fostered by the Oklahoma Association of Ice Cream Manufacturers whose plans were announced in a previous issue of The Ice Cream Review.

Banners and window strips heralding Ice Cream Week had been distributed by members of the association among Oklahoma retailers, according to announcement by officials of the Oklahoma association late in April.

The Oklahomans' plan is unique in many ways. First, they started off with Ice Cream Week from April 10 to April 28. This project had the co-operation of every manufacturer in the state, non-members as well as members of the association. During Ice Cream Week the manufacturers were to supply their dealers with an attractive banner, about three feet long and eight inches high, bearing the announcement that Ice Cream Week was in progress. The banner was highly colored. One end showed a dish of ice cream and the other a colored ice cream pail.

And the movement did not end with the closing of Ice Cream Week. That was simply the beginning of the fun. Following consecutively, week by week, for 19 more weeks the Oklahoma manufacturers will feature a special for each given week. These features will be advertised by gum stickers about two feet long and six inches wide, each series giving the name of the special flavor for that particular week. One end of the strip shows a basket of fruit, and the other end a brick of ice cream. At the end of each week these special flavors will be discontinued except for special orders in quantities large enough to justify the manufacturers in making up the orders.

In connection with this plan, William R. Hauk, manager of the Quality Ice Cream Co. at Tulsa and secretary of the Oklahoma Association of Ice Cream Manufacturers, has sent out a full and complete series of letter covering suggestions for ads, letters and speeches that might be made before chambers of commerce and other civic organizations, as well as women's clubs. These suggestions contain practical ideas for bringing before the public particularly the food value of ice cream.

ABOVE all things, according to Gabe E. Parker, president of the Muskogee Ice Cream Co., Muskogee, Okla., it is the purpose to impress the public with the

food importance of ice cream. The Muskogee Ice Cream Co., the Muskogee Creamery Co., and the Berry Ice Cream Co., which comprise the ice cream manufactories of that city, decided upon carrying joint ads in the local newspapers, and also will distribute circulars. It is likely that this plan will be continued during the 19 weeks of the weekly specials.

Mr. Bennett of the Bennett Creamery, Ottawa, Kans., recently gave the Oklahomans some helpful hints. He told of a campaign of week-end special flavors to be featured for a whole year, thus giving the housewife something to consult and know in advance just what special flavors could be obtained at the stores handling their ice cream. This plan, he said, had the effect of terminating each special when its week was over, rather than, as is sometimes the case, allow a few dragging spasmodic calls for a flavor which they wished to discontinue at the proper time.

"WITHOUT a doubt," one Oklahoma correspondent notifies The Ice Cream Review, "the manufacturers of Oklahoma are going to cause a greater per capita consumption of ice cream through their wholehearted co-operation in this campaign. We know that the weakest end of the ice cream manufacturer's business is his inability to intelligently merchandise the product that he manufactures."

Following is the Oklahoma manufacturers' list of special flavors and their respective weeks:

Oklahoma Association Co-operative Campaign. Sunday.

April 20—Nesselrode Ice Cream.

Saturday.

April 26—Fruit Salad Ice Cream.

May 3—Banana Ice Cream.

May 10—Cherry-Pineapple Ice Cream.

May 17—Fresh Strawberry Ice Cream.

May 24—Orange-Pineapple Ice Cream.

May 31—Grape Ice Cream.

June 7—Fresh Strawberry Ice Cream, Orange Ice.

June 14—Raspberry Ice Cream, Lemon Ice.

June 21—Banana Custard Ice Cream, Pineapple Sherbet.

June 28—Orange Ice Cream, Grape Sherbet.

July 5—Lemon Ice Cream, Raspberry Ice.

July 12—Fresh Peach Ice Cream, Orange Ice.

July 19—Pineapple Ice Cream, Lemon Ice.

July 26—Pistachio Ice Cream, Grape Sherbet.

Aug. 2—Toasted Almond Ice Cream, Pineapple Sherbet.

Aug. 9—Maple Walnut Ice Cream, Orange Ice.

Aug. 16—Fresh Banana Ice Cream, Raspberry Ice.

Aug. 23—Caramel Ice Cream, Grape Sherbet.

Aug. 30—Golden Cherry Custard Ice Cream, Lemon Ice.

Trade Co-Operation in Market Development

By J. ROBERT CROUSE

IMAGINE if you will, a crowd of one hundred million people of all races, ages, religions, with varying degrees of taste and intelligence—the American market in other words. Imagine this crowd in turn divided into the thousands of trade groups and occupations, with each trade group and occupation, with each trade group intent on selling its particular goods and service to the entire crowd and in general each manufacturer or member of a given trade group trying to do the job mostly by himself and we have then a picture of unrelated, unorganized, competitive duplication of advertising and sales effort which is wasteful to an extreme degree. It has resulted in very high costs of distribution which is a matter of common knowledge and adverse comment even to the average man in the street.

It is interesting to note as a preliminary observation, that science through the chemist and the engineer has through research and invention made valuable contributions to the progress of the ice cream business in general. The ice cream factories through improved methods of administration and operation have served well in reducing costs of production. But in the field of the sale of the product there has been no corresponding advance, meaning by this either the sale of more ice cream with the same sales expense or the same volume of sales with a reduced expense. This is a serious and valid criticism which rests upon the business of selling, especially since the selling function adds nothing of intrinsic value to the essential character of the product. Therefore, the obligation is very great upon managements and the men charged with selling and market development, to take the initiative in discovering improved and more efficient methods.

My aim in this article is to call attention to the fact that this has been done in another business, and that it can be done with equal advantage to all concerned in the ice cream business.

FIRST, I desire to present this proposition along general fundamental lines and then to call attention to its practical application. The limits of this paper will not make it possible to outline at this time the form of both national and local organizations for its prosecution although all this has been thought out and is available.

There are always some underlying, basic principles governing all change and progress—whether in the field of research, engineering, manufacturing or merchandising. These principles are of the same essential quality as the axioms in mathematics or refined statements of

particular relations, such as the chemical and biological laws in our business. Such principles do not depend for their truth or power upon minority or majority assent and when once fairly stated, are assured of final acceptance since essential progress must be made in harmony with them.

The sale of ice cream to the public involves, I submit two phases:

The first consists of the education of the public along sound, broad lines in the general advantages of the product and this part of the selling effort should be done co-operatively on a national scale by the trade as a whole and by group action by the manufacturers locally without the waste of endless competitive duplication. This

co-operation in getting over our essential trade message can thus be accomplished with tremendous economy of effort and gain of efficiency.

The second selling phase is the process of selling the product by the individual manufacturer which must continue along competitive lines based on the character and ability of the company and the quality of the individual product. But everywhere there is need of greater confidence and more friendly relations in eliminating many wasteful, competitive methods that result in no benefit to the business of the public.

WHEN we look carefully into the matter is it not true that we are mistaken about who our real competitors are? Are they not in the first place all

manufacturers of food products generally? More specifically, are they not in the second place the manufacturers of candies and soft drinks, etc.? For in any case the human system has a capacity limit in food and drink and the more consumed of certain ones, the less of others. In a third and still larger sense are not our real competitors all other branches of business from the cradle-maker to the coffin maker, for each family, each city and each state and the nation has just so many dollars to spend, and the dollars spent for competitive food and drinks is not available for purchasing our products and neither is the money spent for automobiles, radio apparatus and thousands of other articles.

So it seems to me the fact of the matter is that our direct ice cream competitors are not our hardest competitors but on the other hand this trade competition from all other products is the real competition which we have not fully appreciated. Our ice cream competitors, the supply manufacturers, jobbers, and every one in the business should be in fact our particular allies with whom we should make common cause in getting out

(Continued on page 146)

What About Co-Operative Advertising?

DO WE need co-operative advertising in the ice cream industry? Who is your competitor?

You may think he is the ice cream manufacturer nearest you. But this is not true; the ice cream industry's greatest competitors are the manufacturers of candies and soft drinks, and all manufacturers of food products.

The United States has a productive wealth of approximately 24 billion dollars from agricultural and manufacturing sources. From this purchasing fund we received for ice cream in 1923 the sum of \$253,295,000, or one per cent.

The candy industry in 1919 showed an increase of 232 per cent over 1909, while the ice cream industry showed a productive increase of 176 per cent in the period from 1910 to 1922.

Now: Do we really need co-operative advertising in the ice cream industry?

Advertising the Thousand Dollar Sundae

Undaunted by its Failure to Definitely Establish the Name of the
Inventor, the Hydrox Co. of Chicago Conducts Campaign
for Formula for the Hydrox Thousand Dollar Sundae

AN ADVERTISING urge seems to be sweeping the ice cream industry. The national advertising campaign of the National Association of Ice Cream Manufacturers finds members in many different parts of the country giving more thought to telling the public the story of ice cream than ever before. This advertising is covering virtually every phase of the industry—cones, sundaes, packaged ice cream, ice cream sodas, and just plain ice cream.

The Hydrox Co. of Chicago recently conducted two campaigns to advertise its ice cream, featuring the sundae. In the first campaign the company offered a prize of \$100 to the inventor of the ice cream sundae. As announced in the January issue of *The Ice Cream Review*, the Hydrox Company stated in its advertisements that it also would give "all the Hydrox ice cream sundaes he can eat in a year" to the man locating the inventor. But—

"So far as we are able to determine the name of the inventor is legion," J. E. Davies of the Hydrox Co. stated at the close of the campaign. "The contest we staged brought out so many 'true stories' of the origin of the sundae that it was impossible to establish any one particular claim. The contest created quite a bit of interest in this section and we have followed it up with a bigger contest in which a prize of \$1,000 in gold is being offered to the inventor of the best new, practical ice cream sundae."

The *Ice Cream Review* followed up this last campaign, which resulted in the paying by the Hydrox Co. of a thousand dollars to H. R. Grabrecht of Chicago, whose recipe the judges considered "the finest out of the thousands and thousands of recipes submitted."

Regarding this last campaign Mr. Davies says,

"We think the campaign just closed has been particularly successful, for not only has it stamped the name Hydrox upon the memory of the people of this territory, but it has also brought to our agencies a new realization of the tremendous possibilities for merchandising our advertising and, for that matter, cashing in upon something tangible."

"Right now we are mailing a copy of our winning recipe to all of our agents, the formula for which will be dispensed only by Hydrox agencies and will be called the Hydrox Thousand Dollar Sundae."

TO RETURN to the original campaign: Who did invent the ice cream sundae? The Hydrox Co. would like to know. So would many of the rest of us. J. B. Porter, president of the Oklahoma Association of Ice Cream Manufacturers, seemed to have a good claim to this title. When the Chicago company's contest was discussed in the February issue of *The Ice Cream Review*, on the last page of that issue, it aroused the interest of J. L. Marshall of the Purity Ice Cream Co., Tulsa, Okla., who immediately wrote *The Ice Cream Review*.

In the April issue we had the following comments to make upon Mr. Marshall's statements with reference to Mr. Porter:

"J. B. Porter, president of the Oklahoma Association of

Ice Cream Manufacturers, was the inventor of the ice cream sundae. At least, so says J. L. Marshall of the Purity Ice Cream Co., Tulsa. Mr. Marshall was writing in reply to the advertisement of the Hydrox Corp., Chicago, which firm has offered to give the originator of the sundae a hundred dollars in gold and the man who finds him 'all the Hydrox ice cream they can eat.'

"The pulling power of *The Ice Cream Review* was well demonstrated when Mr. Marshall promptly answered the query of the Hydrox Co. a few days after reading announcement of the offer in *The Ice Cream Review*."

BUT in addition to the claim for Mr. Porter, many other people had something to say.

U. G. McClure, 3534 W. 16th St., Chicago, told the following story regarding the inventor of the sundae:

"Regarding the question 'How old is the sundae (Sunday) and who created it?' I wish to state that 'Sunday Soda' is a Chicago creation, brought about under the following circumstances:

"In the summer of 1893, World's Fair Year, I was employed in the drug store of W. E. Mattern, located in the Millard Avenue Hotel at 1064 (old number) Millard Ave. It was the custom of the newsboys after delivering their papers to gather at the drug store for ice cream soda."

"On the Sunday morning of the birth of 'Sunday Ice Cream,' as usual the boys came in for their soda water, but as our carbonated water tanks were empty, I told them I would give them a good treat."

"Filling each glass about half full of ice cream on which I poured a liberal amount of chocolate syrup, I gave this to them, which they devoured with the utmost delight. Nothing more was thought of this until Monday morning, when the boys came rushing in for another feast like the one on the previous morning."

"As we were getting only five cents for ice cream soda in those days, and knowing that five cents would not cover the cost of the cream alone, I told them, seeking to evade their demand, that was the kind of soda given only on Sunday, but they insisted then that I give them the kind we sell on Sunday. Soon it became, thanks to the news boys' vocabulary, 'Gimme Sunday.'

"We have every reason to believe that the first 'Sunday' ice cream (incorrectly sundae) as applied to this delicacy was created as related and that 'Apple' Hopkins, a newsboy, was the first one to eat it."

"The Sunday ice cream soon became popular throughout the Lawndale district in which we were located, and druggists who were in business in this section in 1893 could verify my claim if any of them were here, but none remain, except myself. It has been very amusing to me to read of the different views on the 'Sunday' creation, but the naming of it was rather more accidental than intentional, and it gives me a great pleasure to present to you the correct facts on the 'Sunday ice cream' question."

* * *

A. Winter, 431 S. Dearborn St., Chicago, had another version of the introduction of the ice cream sundae:

"How old is sundae? It was christened in 1898, and it was christened in this manner:

"A man (I do not remember his name) living in the neighborhood of Drexel and Oakwood Boulevards was in the habit every Sunday morning of going into Gazzolo's Pharmacy, then located where the Drexel State Bank now is, and asking for a glass of ice cream. In those days drug stores did not serve ice cream in dishes. They carried ice cream solely for the purpose of making ice cream sodas. But this particular man did not like carbonated drinks and so got into the habit of asking for the plain ice cream."

"Then one Sunday morning he saw one of the clerks pouring the fresh hot chocolate syrup into the service pitcher."

GRAND RAPIDS, MICHIGAN

and said, 'Put a little of that on my ice cream.' He liked it and came Sunday after Sunday for that dish and got into the habit of saying, 'Give me one of my Sundays.' He told others of his dish and they liked it too, and they also adopted the name 'Sunday,' which later was changed to 'sundae.'

H. Andre Langdon, 2259 Madison St., Chicago, was sure that he had the right dope on the matter:

"The word 'sundae' originated in a Greek candy shop on Canal street, New Orleans. The early part of 1900, I cannot recall the exact date, but the story is as follows:

"His name was George Metropoulos, and his English was limited. His shop was a little hole in the wall and his volume of trade would not make anyone envious. His business would not justify keeping ice cream during the week, but on Sunday he had quite a trade. His window was graced with a laboriously printed sign — 'Ice Cream Sundae.' And he began a new idea of garnishing each dish of ice cream with a bit of fruit. His sign meant that he had ice cream Sunday only. And he spelled Sunday 'sundae.'

"I have no doubt but that I have 'started something,' but I can very easily give you the word of many who can recall the incident."

Teddy Roosevelt was credited with inventing the sundae by Ed. Olson, Brunswick-Balke-Collender Co., Chicago:

"Replying to your question, 'How old is sundae?' will answer:

"Was created by Teddy Roosevelt during his term while serving with the board of commissioners during the year 1894—30 years ago.

"Why were they created? Said Mr. Roosevelt, 'Put a ban on ice cream sodas on Sunday.' The dealer put one over, serving just plain ice cream with syrup, calling it a 'Sundae.'

"When do I get my sundaes?"

COLORADO MANUFACTURERS MEET.

A special meeting of the newly organized Colorado Association of Ice Cream Manufacturers was held at Pueblo, on March 26. Professor Morton, state dairy commissioner, spoke on the need of revising the present statutes on dairy products. The association considered an invitation to merge with The Colorado Creamery Butter Manufacturers' Association to form one dairy products association for the state. This was referred to a committee instructed to report at the next meeting.

PHILADELPHIA IS HOME OF ICE CREAM SODA

The city of Philadelphia, besides being the birth place of our country, is also the original home of the ice cream soda.

Back in 1874, at the exhibition held at Franklin Institute in the old building on Market Street at Juniper, now the site of the great Wannamaker store Robert M. Green introduced ice cream sodas for the first time. This was the beginning of a mighty industry that has grown to enormous proportions. The first day's receipts amounted to something like \$8.00. The daily receipts now amount to many millions of dollars—all from this small beginning.

While not credited with building the first soda fountain, Mr. Green was responsible for many of the features still found in modern equipment. During the first year that he introduced the ice cream soda, Mr. Green established his own manufacturing plant, devoted exclusively to erecting and repairing fountain equipment. In the first year of its existence the entire plant occupied hardly more space than is now covered by one of its many departments. The Robert M. Green Company, one of the leading fountain manufacturing firms today, is owned and operated exclusively by sons of the founder and it is the oldest business in the industry under the same consecutive management.

PEEPING OVER THE PROFESSOR'S SHOULDER

It would be interesting to know just how many manufacturers of the country have been helped in overcoming production problems by Prof. A. C. Baer in his department in The Ice Cream Review. Approximately 50 per cent of the industry's members must have written Professor Baer regarding their troubles, and many manufacturers have worked out their problems by reading the professor's answers in The Ice Cream Review.

PROF. A. C. BAER.

Here is a paragraph from a letter typical of the interest ice cream manufacturers feel in Professor Baer's Inquiry Department in The Ice Cream Review, the writer being a Georgia manufacturer addressing the professor:

"I will watch for your answer in the next issue of The Ice Cream Review. I always read all the questions and your answers in your department with much interest each month."

The professor is too modest to release many of the laudatory letters for publication, but this one happened to slip through.

ENTERS NEW HOME.

The Dairyland Creamery, organized last August by W. Jacoby and C. H. Nickols, recently moved into new home in Ponca City, Okla. The new home 50x125 ft, is modern throughout, and several new additional units of machinery were installed, among which is a Progress homogenizer.

A new pasteurizing machine will be installed in addition to the two now in use and other equipment will be added to make this plant one of the most up-to-date ice cream plants in Oklahoma.

The Dairyland Creamery handles all milk products and distributes from 400 to 500 gallons of milk a day. The ice cream freezer has a capacity of 50 gallons an hour which can be increased to 60 gallons, if necessary.

OKLAHOMANS SET CONVENTION DATES.

The Oklahoma Association of Ice Cream Manufacturers has announced its decision to meet December 8-10. Tulsa was selected as the meeting place at the 1923 convention, but the dates were only recently decided upon by the secretary and other officials. W. M. Burk, secretary of the Oklahoma association, no doubt will make every effort to make the 1924 convention one of the best that the Oklahoma association has ever held.

NATIONAL CONVENTION—NEW ORLEANS—NOVEMBER 17-20, 1924.

THE LADD FILTER provides a means for eliminating from the **ICE CREAM MIX** the finer particles of Foreign Matter that escape the regular strainer furnished with your **VISCOLIZER**. **THE LADD INTERNATIONAL FILTER** can be set into your line from **PASTEURIZER** to **VISCOLIZER** and the **MIX** heated from 110° to 140° will pass easily thru the Special Disc.

THE LADD INTERNATIONAL filters upward. The Inlet is in the Bottom. The pressure is uniform on all parts of the Filter Disc so there is no danger of the Disc being overloaded at any one point.

How the Weather Affects

Rain on Fridays, Saturdays and Sundays Restricts Sales more than on Mondays, Tuesdays and Wednesdays. Early Hot Summer is Advantageous as Against Hot Weather in Fall.

By CHARLES G. MORRIS*

Ice Cream Consumption

Editor's Note—

Have you a carefully studied estimate of what your volume of business will be this summer? This firm has; it is based upon weather bureau records, history, optimism—and guesses. And it makes very interesting reading.

THERE is no question in my mind that weather conditions do affect ice cream sales. But the how, the when, and the why are not so easy to place. There are so many other factors entering into the rate of consumers' demands that the weather alone cannot be blamed for our failures or feted for our successes.

We should all like to be able to foretell the future volume of demand for our product as well as other future events, and doubtless most of us have tried to do it in one way or another. But I think the most of us are not enthusiastic enough about our successes to have them tabulated and the percentages of successes and failures advertised to our friends and foes alike.

I have little doubt that every ice cream manufac-

* Past president National Association of Ice Cream Manufacturers. Written especially for The Ice Cream Review.

turer in this country has, at this moment, a carefully studied estimate of what his volume of business is to be this coming summer. Therefore, I may as well confess that I have the same. What is it based on? Frankly, mine is based on history, optimism and guesses.

A NUMBER of years ago I got a record of our daily sales for several months and the U. S. Weather Bureau's reports for the same period and sat down to my desk with them. I knew it would be only a matter of detail to figure out the relationship between the daily temperatures and the daily sales. After several hours of work I had obtained figures enough to give me a headache, but not enough to prove that the weather had anything to do with ice cream sales. That was, of course, a ridiculous conclusion. So far as I am concerned, it still is.

It is a tradition with us that certain days must be fair weather in order to be profitable. Fourth of July, for instance. Yet a fourth which was a succession of sun and showers that would have done credit to any April traditions, netted us a remarkable volume of sales. So there is another guess coming on that score.

Even though we may have a wet summer coming, it may prove to be better than a dry one. The part of the year may also affect ice cream sales. Hot weather alone, with equal thermometer readings, will not sell as much ice cream on August 25 as it will on May 25.

TWO or three factors of importance do seem to hold fairly steady—though I can't always prove my belief in them. An early, hot summer is advantageous as against hot weather in the fall. Rain with cold weather on Friday, Saturday and Sunday restricts our sales more than it would on Monday, Tuesday or Wednesday—barring the influence of a holiday during the week. Warm, fair weather between say four in the afternoon and bedtime is apparently most favorable for us.

In fact, even warm, muggy, showery, evening weather seems to be better than the most beautiful morning the sun ever rose on, so far as actual retail sales are concerned. Though our retailers' hearts are cheered by the sight of fair mornings, the driver does not leave them so much ice cream when he calls next day, unless the evening is also good.

Add to the influence of the weather such trivial influences as pay day, holidays, the places where people gather and the kind of sociability that prevails in the gatherings; the amount of fresh, luscious fruit, like berries or peaches, that comes on the market from day to day, and perhaps you may then dare to furnish an estimate of what the influence of the weather amounts to, in controlling ice cream sales.

Nizers by the Trainload! Production is rapidly increasing — February 501, March 686, April 900. The May schedule is above 1,100

Watch the Operating Cost of Iceless Ice Cream Cabinets

THE enthusiasm for iceless cabinets is mounting so rapidly, we feel impelled to call critical attention to certain points.

In general, a good iceless cabinet as compared with an ice and salt cabinet, may be depended upon to save transportation expense, handling expense, ice and salt, time, shrinkage and deterioration of the product.

However, these obvious advantages should not be allowed to obscure the question of iceless cabinet operation cost, the principal factors of which are current and water consumption. Nizer records covering thousands of cabinets for periods up to three years, show an average consumption of electricity (at 5c per K. W.) and water the year 'round to be less than 1½c per day per hole. In cool weather this runs below 1c. These Nizer records are absolutely unprecedented and unequalled.

We wish to point out that if these costs were 2½c per day per hole, as might easily be the case with other types of motors, compressors,

refrigerants or cabinets, then excess expense for an 8-hole cabinet in ten years would be about \$450, or more than enough to have bought two cabinets in place of one.

In other words, the use of Nizer cabinets would, in the first ten years, save more in operating cost than your entire investment in them.

In addition to this important point we urge you to avoid cabinets larger than Nizers, because they will not fit into standard fountain interiors as they ultimately will be required to do; further, you should avoid cabinets which, when loaded, exceed the strength of average floors per square foot; further, you must watch excessive installation cost and time, unsuitability of motor to various current conditions, etc.

The full co-operation of our staff is cordially extended to you. We believe that a visit to our plant and the many Nizer installations in Detroit will be a highly profitable investment of your time.

Electrically Operated Ice Cream Plants

A Discussion of the "Electrification" of Ice Cream Plants
A Vital Topic at This Time—Their Economy

By F. B. FULMER

(Written Especially for The Ice Cream Review)

THE modern tendency in all manufacturing establishments is toward efficiency and economy. Any method that promotes either of these factors is looked upon with much favor; a method that will combine both of them to a large degree should be acclaimed as the ideal.

Progressive establishments are coming more and more to lay greater stress upon **operating costs** and to balance savings thus effected against first costs, and the latter are not now occupying the relative position of importance that they have in the past. This is well illustrated by the action of the Carnegie steel mills that remodeled and installed new apparatus in their plant in Pittsburgh some time since at a cost of one million dollars. Shortly afterwards a new and more efficient process was developed; so they literally scrapped the million dollar investment at once in order to avail themselves of the new process.

The electrification of ice cream plants is a vital question at the present time and deserves the most careful consideration. The apparent greater first cost is the only practical argument that can be raised against it, and in most cases where a new plant is being built—be it either large or small, the greater first cost is more apparent than real. While it is true that a direct motor

driven ice cream freezer costs more than a belt driven one—it is an open question if there is much saving from a financial standpoint when the expense of hangers, shafting, pulleys, belts, belt-guards and labor to erect these are added to the cost of the belt-driven machine.

As an offset to any real or fancied financial saving for the belt driven machine, there are several factors in favor of the individual motor-driven ice cream freezer that should be duly considered.

THERE should be no room for argument regarding the factor of the more sanitary condition of the direct motor driven machine over the belt driven one; the presence of rapidly moving belts, pulleys and shafting in a room will by necessity create currents of air that are not beneficial and such moving machinery always throws off more or less dirt and greasy specks which do not create a favorable impression on a careful observer and the whole question of such moving parts around where a delicate food product is being manufactured **does not cause a pleasing appearance!**

As all of the application of power to operate a direct connected ice cream freezer is protected by substantial guards, it is practically impossible for an operator to be accidentally injured by being caught in a moving part at any time.

With belt driven machines and the necessary shifting of belts a certain amount of danger exists at all times. In many states, industrial safety regulations require guards to be placed around belts, pulleys and other moving parts and when this is done the particular machine in question may not be as easy to operate.

The direct driven ice cream freezers can be placed closer together, owing to the fact that there is no overhang of pulleys, shafting and bearings, which occupy considerable space. Stated in a practical way, four motor driven machines can be placed in the space ordinarily occupied by three belt driven ice cream freezers—hence this is equivalent to a saving of 33 1/3 per cent in space.

The other machinery used around an ice cream plant can be placed closer together if they are motor driven and space saved to the greatest practical limit. Direct

Plant of United Cork Companies at Lyndhurst, N. J., where the 100% Pure "Crescent" Corkboard is made.

motor driven machines of any class are always compactly built and thus occupy the minimum of space.

AT THE present time the factor of power economy occupies a more prominent position in the industrial world than ever before. Facing the situation from a practical standpoint, it is no visionary statement to say that all steam generated power will become more expensive as time passes.

The supply of solid and liquid fuel is diminishing and while some new supplies will be discovered, the cost of obtaining them will be increasing all the time, so the logical deduction is that the future will see an increased cost in the production of steam power.

The present tendency is toward the development of all practical hydroelectric generation, both as a source of new power to meet growing demands and to develop it at as low a cost as is possible.

Considered as a power generator the best modern reciprocating steam engine delivers as effective power about 12 to 14 per cent of the total heat developed by the combustion of the fuel; steam turbines may reach 20 to 25 per cent efficiency and the internal combustion engine has a theoretical thermal efficiency of approximately 40 per cent.

On the other hand the electric motor has an efficiency of 85 to 90 per cent, as proven by actual tests and it will deliver as effective work from 75 to 85 per cent of the original power developed at the hydro-electric generating station which may be from 250-300 miles distant from the motor.

AGAIN the starting and idle running power consumption of a motor is approximately 20 per cent of the rated power demand for full load duty. When a battery of several ice cream freezers are belt-driven (the motive power being supplied by a single large motor) the friction of the shaft, pulleys and belts cause considerable loss of power and the ratio of loss is much larger if only one or two freezers are being used at one time. Whenever a motor driven freezer is not required for operation it can stand idle and power to drive it is only applied when needed, hence the single unit application of power is much more elastic under operating conditions and far superior in power efficiency than belt driven freezers.

The same principle applies to other pieces of apparatus used in an ice cream plant, where motor power is required. The motor driven homogenizer occupies less space, can be located in the most convenient position (without reference to the location of the shaft) and is a far safer machine for the operator to be around, as all hazard of personal injury from a belt is removed. The pasteurizing and storage vats for the ice cream mix are more easily located and present a more sanitary appearance with direct motor drives than belt driven machines do.

IN THE matter of starting and stopping ice cream freezers, the pasteurizers, homogenizers and storage tanks, the simple throw of a switch handle or the pressing of an electric button is more rapidly done than the shifting of a belt. This saving of time enables the operator to get all of the freezers running quicker and the economy applies all along the time of operation during the time that he is engaged in freezing, pasteurizing, homogenizing and cooling. The usual belt troubles are eliminated; a more convenient condition prevails and the logic of the situation is, that electrically operated ice cream plants as well as all places where articles of food are processed present the highest sanitary condition possible.

Nutting

Ice Cream Can Truck

Built Like a Steel Bridge!

You will get many more years of service out of this well-built, extra strong truck. The *Nutting* is built of structural steel, solidly braced by thick steel gusset plates and heavily riveted. The entire frame is galvanized.

Easy running. Balance type for quick turning. Large main wheels, ball bearing casters. Both wheels and casters are heavily built and have wide flat faces to save floors.

Convenient. Dirty cans piled with open end out and slant upwards to keep contents from spilling. Washed cans are piled with open end in and slant down for quick draining. *Top railing holds all covers.*

New low price Fig. 106 (30x66 in.) Top rail included. F. O. B. Faribault or Chicago \$52.00

(less without cover-holding top rail)

Order from your jobber or write us for complete information.

Replies to Inquiries

Dear sir:—Will you please figure me out two formulas, one for a ten per cent butterfat mix and one for a twelve per cent butterfat mix, desired enough total solids to give high overrun but want to avoid sandy conditions. Supplies available are 40 per cent sweet cream, plain skim condensed milk 4 to 1, this runs either 32 or 35 per cent solids. Can get fresh sweet milk 4 per cent sometimes, but think that part of the time will have to eliminate fresh milk and will have to substitute water. In this case, can't you figure me a formula with water and then give me a scale whereby I can work from my original formula of 40 per cent sweet cream, skim condensed and sweet milk 4 per cent, and where I have to substitute one gallon of water for a gallon of fresh milk, to advise how much more sweet cream and condensed I will have to use to make up the shortage of fat and solids.

Reply: You are at a considerable disadvantage because you have not efficient equipment for the proper processing of your mix. I am, however, suggesting table one and table two, formulas which you can make up

in a ten gallon can. You will notice that all four of these suggested mixes weigh 88 pounds. A ten gallon can should easily hold this amount of mix, allowing a little lee way for stirring.

Table One.

88.0 lbs.—10% mix using 4% milk	88.0 lbs.—10% mix No 4% milk
12.3 lbs. sugar	12.3 lbs. sugar
.44 lbs. gelatine (7 oz)	.44 lbs. gelatine
20.0 lbs. condensed (32%)	28.0 lbs. 32% condensed
18.40 lbs. 40% cream	22.0 lbs. 40% cream
36.9 lbs. 4% milk	25.3 lbs. water
88.0 lbs. mix.	88.0 lbs. mix

Table Two.

88.0 lbs.—12% mix using 4% milk.	88.0 lbs.—12% mix using no milk
12.3 lbs. sugar	12.3 lbs. sugar
.44 lbs. gelatine	.44 lbs. gelatine
16.0 lbs. condensed	20.0 lbs. condensed
22.6 lbs. 40% cream	26.40 lbs. 40% cream
36.7 lbs. 4% milk	28.90 lbs. water
88.0 lbs. mix	88.0 lbs. mix

I am indicating in both table one and table two, a mix made with your 4 per cent milk and without. Table one shows the 10 per cent mixes and table two the 12 per cent properly balanced with condensed for milk serum solids.

I am also showing on the mixing and freezing room report the figures for the two mixes containing the 4 per cent milk.

It would be perfectly possible for you to use milk powder and water. The powder can be dissolved in luke warm water and if it is a soluble product, your milk solids could be added in this way as well as in the form of condensed milk.

It appears from your discussion that you are not pasteurizing your ice cream mix and it would, of course, then be necessary for you to dissolve your gelatine in either water or milk and then heat it up to about 170 degrees before adding it to your cold mix in your ten gallon cans. The mix must of course, be stirred violently while the gelatine is slowly added to it.

* * *

Dear Sir:—Please figure for me the ice cream mix containing 15, 18, 20 per cent fat, and the amount of ingredients to use, as unsweetened condensed skim containing 28 per cent solids, 38 per cent cream, and 3.8 per cent milk.

Please let us know the proper amount of sugar and gelatine to be used in this mix. This is to be figured on a 100-pound mix basis.

We would like to know how much vanilla should be used to flavor 100 pounds of mix. Also, can you give us the approximate weights of these different mixes per gallon?

Reply: I am glad to suggest in the following tables.

What Taper-Insulated Cabinets Mean to Your Business

WHEN you purchase a cabinet, you naturally want the best and most efficient money can buy—

A cabinet that stands up; that consumes *little ice*, and at the same time *keeps the cream hard* until served.

The famous Grand Rapids Cabinets meet these requirements because they are *taper-insulated*.

A glance at the sectional view below will show that the cork insulated walls of this dependable cabinet are 5 inches at the bottom, and only 3½ inches at the top.

As cold has a tendency to settle, this extra insulation at the bottom is just where it is

needed. It helps to keep the cream hard and saves ice.

On the other hand, less ice is needed and used at the bottom than at the top. Consequently, it requires less to ice a Grand Rapids Cabinet, at a *further saving in ice*.

Showing No. 535, three-can size.

All Grand Rapids Cabinets are handsomely finished on all four sides. Any side may face out with the faucet in any desired direction. Solidly built of cypress and red wood with heavy hardwood corner posts

forming the legs and running full height of cabinet.

You must see these handsome cabinets to appreciate them fully—better order your sample *now*.

is the single-can size. (No. 513).

"A Stitch in Time Saves Nine"

OUR years of experience in dairy and ice cream equipment qualify us to offer valuable advice in the selection, purchase, and installation of ice cream and refrigerating machinery. **We have our customer's best interests at heart.** Of course, after you have purchased, it is then **too late** to avail yourselves of our experience. Let us advise with you beforehand. Our suggestions place you under **no obligation**.

Cross section of style No. 5. The walls are filled with cork. Note taper-insulation.

LE ROY, MINN.

You will notice the difference between table one and two being the amount of sugar used. I do not believe it is necessary for a cream to have over 35 per cent total solids and you might want to try the mix in table two. The approximate weights of either one of these mixes is 9 pounds to the gallon, the variations between them being so slight as to be negligible.

The amount of vanilla to add to 100 pounds of mix would, of course, vary with the grade of vanilla used and I could hardly give you any definite information as to the amount of vanilla.

* * *

Dear Sir:—Will you kindly look over the formula below and offer suggestions as to its betterment? No trouble is had in obtaining the overrun. In fact, we get more than we desire. The finished cream seems to be a little porous and grainy, and I wondered if the fault would be in the mix or in the freezer—the batch freezing up rather rapidly. Here is the formula, 10 per cent fat standard, 13 per cent sugar desired (600 lb. batch). Skimmed cond. (sweetened) 30 per cent solids, 40

per cent sugar.....	100 lbs.
Butter	72 lbs.
Sugar	38 lbs.
Powdered milk.....	37 lb.
Gelatine (Delft).....	4 lbs.
Water	349 lbs.

251 lbs.

The entire batch is emulsified through a Hawk emulsor.

Reply: I have analyzed your ice cream mix and you will find the calculations given below in table one. You will notice that the calculations of your mix show that you have the butterfat and solids proportioned correctly and you should apparently have no trouble in making satisfactory ice cream from this mix:

Table 1.—600 lb. Mix.

Ingredients	Fat	Serum Sol.	Total Sol.
100.0 lbs. sweet cond.....	30.00	70.00
72.0 lbs. butter	60.48	60.48
38.0 lbs. sugar	36.10
37.0 lbs. skim powder.....	35.15	35.15
4.0 lbs. gelatine	3.80
349.0 lbs. water
600.0 lbs.	60.48	65.15	205.53
Per cent	10.08	10.86	34.25
Per cent sugar	13.0

However, I know that some of your trouble in getting your porous and grainy ice cream is undoubtedly due to

Take Me Out to the Ball Game - - -

IT'S THE SONG OF THE

Purity Paper Can

IN THE QUARTER-PINT SIZE!

The "baby" of the family is the proper one for use at the ball park or any other outing. And it's the squat-type (regular $3\frac{3}{8}$ " diam. x $\frac{3}{4}$ " deep) that is easiest to handle. And the "easy-to-handle" container is always the one preferred. That accounts for its popularity!

It's intensely human to become hungry and thirsty at any outing so the purchase that appeals most is the product combining food and drink.

Just fill the Quarter-Pint PURITY PAPER CAN with delicious ice cream, sherbet or ice. That's the best treat for anyone! And the squat-type is simplest to fill at your own plant. Its shallowness makes "re-dipping" child's-play if you prefer your dealers to fill the CANS! Simply snap a paper spoon under the crimp of the lid and then watch the boy throw his package way up in the stands to eager customers. Treat PURITY PAPER CANS rough. They are built to stand it.

And don't overlook the sale of these special packages on trains, excursion steamers or any other outing.

PUT YOUR ICE CREAM INTO PURITY PAPER CANS either at your own plant or at your dealers. It's permanent business building.

Samples and Prices on request! A full line of sizes for all uses!

The Purity Paper Vessels Company

BALTIMORE, MARYLAND

Also makers of the famous line of PAVESCO Paper Milk Bottles!

the use of the steam emulsor. I believe I have located more trouble similar to yours due to the use of a similar emulsor than from any other cause. This steam emulsor introduces a lot of water into the mix due to the condensing of the steam. This not only lowers the per cent of solids in the mix, but very often while emulsifying the mix comes out of the emulsifier at a very high temperature, giving the ice cream a characteristic cooked flavor. Undoubtedly this is the flavor which you have believed was due to the milk powder and condensed milk. I believe that if you will put in a different type of emulsor, using one of those centrifugal machines you would get much better results.

* * *

Dear Sir:—I am wondering if you can tell me what to use to make my cream stand up better. I am using the following mix: 11 per cent fat, 11.5 per cent serum solids, 13 per cent sugar, .75 per cent gelatine. I use about half sweet cream for fat, balance sweet butter; use 144 lbs. of Libby's evaporated milk to 800 lbs. of mix; get the balance of solids from powdered skim milk and sweet skim milk, pasteurize, emulsify and freeze in a brine freezer; take a 90 per cent overrun.

Reply: If your mix contains 11 per cent butterfat, 11½ per cent serum solids and 13 per cent sugar, I can see no reason why with the amount of gelatine which you use your ice cream should not stand up well after it is made. It is possible that your competitor is using a large amount of stabilizer and possibly a cream with a rather high percentage of serum solids. It is also possible that there may be something wrong with some detail in the handling of your cream.

I suggest that in order to arrive at the difficulty you send me a more detailed account of how you make your

mix, showing the various ingredients in pounds and I will calculate the fat and solids so that we will be sure to have the 35 per cent or more of solids which you appear to have. Then, if you will give me your pasteurizing temperature, your emulsifying temperature, the length of time you age your mix before freezing and the average temperature of your hardening room, your method of packing it out for the retail trade and perhaps other details, I am sure that we can solve the difficulty.

* * *

Dear Sir:—We have had trouble with ice cream freezing in the can and settling at the bottom in a luncheonette. Please analyze the following mix and give suggestions. Sugar, 252 lbs.; skim milk, 200 lbs.; butter, 183 lbs.; 3.7% milk, 605 lbs.; water, 650 lbs.; gelatine, 10 lbs.

Reply: You will find below an analysis of your mix showing the calculations of butterfat, serum solids and total solids:

Your Mix.			
Ingredients	Fat	Serum Sol.	Total
252.0 lbs. sugar	239.4
200.0 lbs. skim powder	190.0	190.0
183.0 lbs. butter	153.72	153.72
605.0 lbs. 3.7% milk	22.37	51.8	73.1
10.0 lbs. gelatine	9.5
650.0 lbs. water
1900.0 lbs.	176.09	241.8	665.7
Percent	9.26	12.7	33.4

The figures apparently show that your mix is nicely balanced and you should have no difficulty in getting satisfactory ice cream. I see no reason why if everything is handled correctly your ice cream should fall out of the can or settle at the bottom.

I have never before analyzed a mix similar to yours and where they had the trouble which you describe. It appears, however, that the temperature of brine of 20 degrees for freezing is a little high. A 10 degree temperature would be much better and would freeze your product in less time and properly whip it to a different consistency which might eliminate your trouble.

When drawing the cream from your freezer the can should immediately go into the hardening room so that the cream will not melt around the outside where it is in contact with the warm can. It is possible that settling at the bottom is caused by keeping your ice cream after drawn from the freezer too long a period before it is subjected to a low temperature in the hardening room. If you could have your hardening room at a temperature around zero when the ice cream is put in from the freezer I doubt if you would have this serious trouble.

* * *

Dear Sir:—We are anxious to make the ice cream as near "home made" as possible, that is, little gelatine

but we want high total solids, say around 40 per cent total solids, 14 per cent sugar and 12 per cent fat.

Reply: You state that you are anxious to make ice cream as near "home made" as possible and that you want a 12 per cent butterfat, 14 per cent sugar and 40 per cent total solids product. Such a product will, in my opinion, be very far from being a home made ice cream. I also believe that your idea is entirely wrong, for we should get away from the so-called home made ice cream and put ice cream on the market and call it ice cream made in a modern factory with modern equipment; handled under the most modern and sanitary conditions.

It is not necessary to make a product which will stand up indefinitely due to a large amount of gelatine; in fact, I believe we should use just as little gelatine as possible and still keep our cream in good physical condition in our hardening rooms.

I am suggesting below in table one a formula for a 12 per cent butterfat cream. You will notice, however, that I did not make the total solids 40 per cent. It would be impossible for you to make an article containing 40 per cent as your milk serum solids would be around 15 per cent and you would most assuredly get sandy ice cream. About 12 per cent serum solids is all I could recommend to you in order to be safe from that angle:

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar			13.30
.3 lbs. gelatine27
1.0 lbs. skim powder.....		.95	.95
20.0 lbs. cond. skim.....		6.40	6.40
36.5 lbs. 30% cream.....	10.95		
28.2 lbs. 4% milk.....	1.12	4.69	16.76
100.0 lbs. mix	12.07	12.04	37.68

SALES OFFICES AND STOCKS IN PRINCIPAL CITIES

Dear Sir:—We are having some trouble in getting our overrun from this mix:

248 lbs. 20% cream.
15 lbs. 36% sweet cream.
67 lbs. sugar.
2¼ lbs. gelatine.
21 lbs. skim milk powder.
97 lbs. Water. This is a 450 lb. mix.

Reply: I have analyzed your ice cream mix and you will find the calculations given below in table one:

Ingredients	Fat	Serum Sol.	Total S.
248.00 lbs. 20% cream.....	49.60	17.66	67.26
15.00 lbs. 36% cream.....	5.40	.85	6.25
67.00 lbs. sugar			63.65
2.25 lbs. gelatine			2.13
21.00 lbs. skim powder.....		19.95	19.95
97.00 lbs. water			
450.25 lbs. mix	55.00	38.46	159.24
Per cent	12.20	8.50	35.40
Per cent sugar.....	15.00		

There is no reason why you should not get a satisfactory overrun from this mix. You gave me, however, information which would assist me in locating your difficulty in getting the overrun. It is possible that you are not pasteurizing your mix at the right temperature; that you are not cooling it promptly and low enough and that you are not aging it for a sufficient length of time. It is possible that there might be something wrong with your process.

Dear Sir:—Regarding the mix referred to in a previous letter, will give you process through which it goes: 248 lbs. cream, 20 per cent; 15 lbs. cream, 36 per cent. Heat to 110 degrees F., add 21 lbs. of powdered skim milk, dissolve, add 2.25 lbs. gelatine, sift in slowly, heat up to 130 degrees F., and 67 lbs. sugar, dissolve and heat to 145 degrees F., let stand for one-half hour; add 97 lbs. water, making a mix of 450 lbs.; cool this mix down to 120 degrees F., and run through viscolizer at 2,500 lbs. pressure, over a brine cooled tubular cooler, bringing the mix down to 40 degrees F.; age from 12 to 24 hours in ten gallon cans in room which is held at temperature of 20 degrees F. The overrun of this mix is 90 degrees.

Reply: After reading over your letter carefully it does not appear that there is anything wrong with your method of handling and processing the mix, except at one point where you state that you age the mix from 12 to 24 hours in ten gallon cans in a room kept at 20 degrees F. This aging temperature of 20 degrees is too low, as your mix undoubtedly must freeze at that temperature. This may be the cause of some difficulty you have in getting the overrun.

The mix during the aging period ought not to be held at a temperature lower than 30 and I would prefer to have it held at 35. You will also find that aging the mix twelve hours will not put it in the right shape to get the overrun. Twenty-four to thirty-six hours would give you much better results.

* * *

Dear Sir:—We have been having a few complaints regard to sandy ice cream and falling in the cans. You have been using the following formulae:

11.50% butterfat.
11.50% serum solids.
14.00% sugar.
.50% gelatine (best brand we can buy).
37.50% total solids.

(Continued on page 40)

"GMC trucks are seven steps ahead"

GMC Life Is Longer and Maintenance Cost Less

GMC capacity for uninterrupted daily service makes it especially well adapted to heavy delivery duty. GMC is built oversize in every part of both engine and chassis to assure this continuous service and to prolong GMC life beyond the average. Moreover, every wearing part throughout the whole truck is fitted with a removable bushing or bearing that can be quickly and easily removed. Thus GMC maintenance cost is greatly reduced.

GMC offers haulers a means of transportation that is unsurpassed for efficiency, endurance and economy. Built on the experience of years of successful truck manufacture and incorporating seven distinctive features of construction, GMC not only assures an increased earning power but also lower operating costs. GMC can show profits under conditions impossible to the average truck and will remain in service for years beyond the normal life of a truck.

These and other special GMC advantages are fully explained and GMC construction described in the GMC illustrated catalogue and booklet "Seven Steps Ahead". They are free and a request for them does not obligate you in any way. The coupon below is for your convenience. Fill it in and send it to us today.

Wirfs' "Airtite" Cushion Door Gasket

\$AVES YOU DOLLARS\$

Many efficient refrigerating and cold storage plant managers have learned that dollars are to be saved by applying the "AIRTITE" CUSHION DOOR GASKET to the overlap of the doors of the plant.

No. 0 JUMBO

No. 1 LARGE

No. 2 MEDIUM

No. 3 SMALL

No. 4 SPECIAL

The GASKET is a rubberized, insulated strip that is water-proof, tough, yet flexible and resilient, and will last for years. It pays for itself in a very short time by stopping cold air leaks and so reducing the cost of refrigeration.

To prove this—run your hand or a lighted candle along the sides and bottom of your door and feel and see (by the flickering light) the cold air that flows out, 24 hours a day, every day.

Easy to apply
Simply tack on—
Turn the corners

Send today for prices and sample card showing five standardized sizes.

Sole Manufacturer and Patentee

105 S. 17th Street,
St. Louis, Mo.

"AIRTITE"
CUSHION
DOOR GASKET

Every batch is tested for fat and total solids on a Mojonnier tester. We run from 95 to 100 per cent overrun and use the following ingredients in the mix: Whole milk, 4% butterfat; superheated cond., 30% total solids; cream, 40% butterfat. We try to not let our superheated condensed get over two days old. Do you think that our mix is evenly balanced? If we would reduce our overrun to 85 per cent, this would stop our cream from falling in the cans, would it not? We use our mix from 48 to 72 hours before freezing. But we only put about 800 pounds pressure on the homogenizer on account of the gelatine being added in the pasteurizing and if we add any more pressure we cannot get the mix out of the cans. We have no aging vat; we must use our mix in cans.

My idea is that some of this sandiness comes from the low pressure on the homogenizer. Is that your opinion?

Our hardening rooms are not kept at as even a temperature as they might be. Sometimes after the ice cream is frozen hard they let the temperature go up in the rooms and allow the ice cream to get soft and then freeze it again.

Reply: From the information that you have given in your letter it appears that the sandy condition of your ice cream is due to the possible use of too large an amount of superheated condensed milk to build up solids to 11.5 per cent. I would suggest that you reduce the serum solids from 11.5 per cent to about 10.5 per cent and see if that will not overcome this difficulty.

If the cream continues to fall in the can the trouble is not due to any lack of solids, but I believe it is due to drawing the cream from the freezer when a little too soft. I suggest you try freezing it to various degrees of thickness before drawing it from the freezer and make a comparison and see if it will not hold up a little better when you freeze it a little harder. I have found that this happened in a number of factories where an ice cream was made containing more than 35 per cent solids.

The tendency seems to be because the mix was relatively thick to draw it a little too soon from the freezer. You stated that you thought the low pressure of running the homogenizer was the cause of the sandy condition. I do not believe that is the case. Furthermore, if a higher pressure on the homogenizer will make the mix too thick, you are using too much gelatine and I would suggest reducing the amount of gelatine so that you can operate your homogenizer at the right pressure. Then again, according to your letter, I believe a large part of your trouble, if not all, might be due to the irregular temperature of your hardening room. If you permit the ice cream to become soft in your hardening room some of the heavier solids will settle to the bottom of the can causing the upper part of the can on top to be lighter in solids which will cause it to fall.

The hardening room should not be permitted to vary more than fifteen degrees in temperature so that if the lowest temperature of your room is five below zero the temperature should not go higher than ten above zero before the refrigeration is again turned into the hardening room.

STANDARD FOR ICE CREAM PROPOSED BY FOOD COMMITTEE.

The Joint Committee on Definitions and Standards for Food Products has proposed a definition and standard for ice cream, with the recommendation that it be published for the purpose of discussion and criticism, according to Dr. W. W. Skinner, chairman of the committee. The proposed definition is intended as a substitute for the present definition for ice cream, which was published in Circular 136 of the Department of Agriculture. The action of the committee is taken in response to suggestions from state food officials and resolutions adopted by The Association of American Dairy, Food and Drug Officials, to the effect that the definition ought to be changed to meet the developments of recent years in the production of commercial ice cream.

The committee invites criticisms and suggestions regarding the proposed definition and standard from food officials, consumers, the trade, and all other interested parties. Communications should be addressed to the Secretary of the Joint Committee on Definitions and Standards, Bureau of Chemistry, Washington, D. C. The text of the proposed definition and standard follows:

Ice Cream.

ICE CREAM, PLAIN ICE CREAM, is the clean, solid, frozen product made from a combination of one or more of the following, viz., cream, milk, condensed milk, sweetened condensed milk, dried milk, skimmed milk, condensed skimmed milk, sweetened condensed skimmed milk, dried skimmed milk, butter, water; with sugar (sucrose), with flavoring, and with or without added stabilizer consisting of wholesome, edible material—such that it contains not less than twelve per cent (12%) of milk fat, not less than twenty per cent (20%) of total milk solids, and not more than one-half of one per cent (0.5%) of stabilizer. It weighs not less than three and three-quarter avoirdupois pounds (4.75 lbs.) per gallon.

NEW MEMBERS FOR NORTH CAROLINA ASSOCIATION.

A. E. Dixon, secretary of the North Carolina Ice Cream Manufacturers' Association, has announced four new associate members and three new active members to his association.

The new associate members are the David Michael & Co., Philadelphia; International Co., Baltimore; Brooks & Co., Norfolk, Va.; and Essex Gelatine Co., Boston, Mass. The active members are Peoples Ice & Fuel Co., Rutherfordton, N. C.; Smith Ice Cream Co., Leaks, N. C., and Co-operative Dairy Co., Concord, N. C. Secretary Dixon has issued his membership a bulletin describing a budget for the ice cream industry prepared by the Policyholders' Service Bureau of the Metropolitan Life Insurance Co. Mr. Dixon states that this budget so impressed him that he requested a supply to be distributed to his membership.

A CORRECTION.

In the April issue of The Ice Cream Review the name of the new book being announced by Warner-Jenkinson Company was given as "Ice Cream Carbonated Beverages" in their advertisement on page 19. This book is titled "Ice Cream and Carbonated Beverages." The price is \$2.00, but free copy will be mailed to any one of Warner-Jenkinson's customers applying for one. If one of you customers of this firm have not received it in your application by letter or post card or hand it to one of their salesmen. The book is worth having.

MENTION "THE REVIEW"—IT IDENTIFIES YOU.

Possibly you are not aware

that the original Meridale milk powder can now be purchased *direct* from the famous Meridale Farms? In other words, it is now possible to secure direct, Meridale Milk Powder, recognized by leading ice cream manufacturers for many years as possessing superior flavor, body, color and low moisture content. It is 100% soluble in water.

By buying direct you are further assured of a fresher product as Meridale Milk Powder is manufactured from fresh skimmed milk, a large percentage of which comes from Jersey cows.

NEW YORK CITY

The Ice Cream Industry of the Middle Atlantic States

NEW YORK

PENNSYLVANIA

NEW JERSEY

A STORY is told of a little girl driving a cow. Two lads from the city came along in an auto. One of them called out to the little girl, saying, "Are you minding that cow or is that cow minding you?" After a moment's hesitation the little girl, without raising her head, replied: "I ain't mindin' this cow an' she ain't mindin' me, but both of us are mindin' our own business."

Ice cream manufacturers should like that story. For if there is one thing that the average ice cream manufacturer likes to do, it is to attend to his own business.

On following pages we are telling how ice cream manufacturers in three of the most important states in the country, in ice cream production, have won success by not alone attending to their own business but also making it their business to tell the public something about ice cream.

Pennsylvania and New York stand at the top in ice cream production. New Jersey is high up on the ladder. These three states in the Middle Atlantic group have been singled out for featuring in this issue of The Ice Cream Review because their ice cream manufacturers have done something toward building up their industry that everybody in the industry should know about.

Men in the ice cream industry do not know enough about what men in other states are doing. Very few of us realize the important work that trade associations are doing. An ice cream manufacturer in one state at one end of the country may think that he and his neighbors are doing everything possible to boost ice cream, though he knows that much of his efforts are going toward getting all the dealer accounts he can. But when we study what the gentlemen of the Middle Atlantic states are doing we realize that there is much more to this business of manufacturing ice cream than many of us have realized. New York, New Jersey and Pennsylvania are teaching us something about intensive merchandising.

They are showing how the ice cream manufacturer can take up the burden of salesmanship and take his story to the consumer. They have not swayed back in their easy rockers as it were and waited for the dealers to decide their profits at the end of the year.

IT HAS long been evident that where associations are most active, there also is business being conducted along the most advanced lines. No where in the industry are there two more useful organizations than the Association of Ice Cream Manufacturers of Pennsylvania and New Jersey and the Association of Ice Cream Manufacturers of New York State. It is to this territory that the National Association of Ice Cream Manufacturers often turns for material for its high stations. Such men as Vernon F. Hovey of Schenectady, N. Y., E. E. Rieck of Pittsburgh, A. G. Hoeffler of Buffalo, E. B. Lewis of New York City, W. J. Weller of Brooklyn, W. E. Hoffman of Tyrone, Pa., J. E. Wiedenmayer of Newark, J. W. Neuman of York, Pa., S. T. Nivling of Rochester, E. C. Sutton of Buffalo are just a few of those who have been called into the ranks of service by the national association.

These are some of the men who have built up an ice cream empire in the Middle Atlantic states such as to excite the admiration of thoughtful members of the industry everywhere.

It is something of more than momentary importance when we undertake to discuss some of the things these men have done for bettering conditions in the ice cream industry.

This is the story of gentlemen who have time and sufficient enterprise to do something more than attend to their own business. They made it their business to find out from the public the kind of ice cream the public wants, and then they busied themselves in showing the public why more ice cream should be eaten.

Pennsylvania is Greatest Ice Cream State

Manufacturers of Keystone State Produce
30,000,000 Gallons Annually

PENNSYLVANIA is the world's greatest ice cream state. Manufacturing more than 30,000,000 gallons of ice cream annually, the Keystone state occupies the pinnacle position in this industry. Making more than their state's requirements Pennsylvania ships considerable ice cream into other states.

Pennsylvania has everything present that goes to make an ideal condition for the ice cream business. Agriculture and industrial prosperity go hand in hand in that state. The soil is rich and productive, farmers are following advanced methods, colleges are overflowing with students pursuing the study of agriculture and mechanical arts, and manufactories are running to capacity virtually throughout the year. It is seldom that "hard times" hit Pennsylvania, even when depression is heavy in other parts of the country. The state was among the first to develop dairy industry, and efforts are going forward in that direction every year on an increasingly large scale.

When we study what has been done for the development of ice cream consumption in that state we get a better idea of wise courses to pursue toward getting the people to eat more ice cream. First, according to Pennsylvania's ice cream progress, there must be the right background of industrial and agricultural prosperity. The larger cities thrive on the regular weekly pay envelopes, and both the cities and communities are dependent upon farm conditions. Ice cream sells best among those people who have not necessarily a great deal to spend but have it to spend regularly, however small the amount may be. It will be noted in this connection that the manufacture of ice cream is not the only industry in which the Keystone state excels; their progress has been made steadily, almost without interruption, since long before those frenziedly enthusiastic gentlemen gave a certain bell such an earnest pulling that it cracked under the strain.

PENNSYLVANIA ice cream manufacturers have seized upon their favorable natural conditions and pushed ice cream. They give us a lesson in the difference between manufacturing the frozen beverage for the dealer and making the best possible product for the consumer.

"Long ago," says one ice cream manufacturer in

the state of smoke and steel, "I realized that success to cope with men following advanced methods in industry, I would have to look beyond the dealer and what the people who pay the tariff have to say about kind of ice cream they like. That was several years when there were not so many people in the ice cream manufacturing business in Pennsylvania as there is now. But they were energetic. I saw that most of them had stolen the march on me and were far along the road of working up business among the people who really have the say-so as to how much ice cream shall be sold. For the past ten years I have been sticking out along this line, and every day I realize that this is a tremendous field that even we have not touched. Philadelphia's ice cream consumption may look large to some people, but is not a circumstance to what can be developed.

"Thus far the manufacturers have stood virtually alone in developing new business, depending mostly upon high-grade ice cream and plenty of advertising, but still need the co-operation of the dealers. The dealers have been sitting still and allowing us to do all the work.

"Let the manufacturers of other states make the best ice cream they possibly can, advertise more and work harder on winter consumption, and it won't be long before other states will be just where we in Pennsylvania are now. But let them do all of these things and get the co-operation of their dealers besides, and soon they will be making far more ice cream than this state is doing. By that time we hope to have something accomplished in this direction and also be going ahead.

They have studied the science of ice cream salesmanship in Pennsylvania, and once they get some of the knowledge imparted into the dealers, there will be something done that really will make the rest of the industry open its eyes.

THE Association of Ice Cream Manufacturers of Pennsylvania and New Jersey, one of the oldest in the entire industry, has done much to stimulate interest in quality ice cream. This is one of the largest state associations in the industry.

Four years ago the late Robert Crane of the Crane Ice Cream Co., Philadelphia, and one of the char-

The New Solderless - Rivetless

Ice Cream Packing Can

RELATING to riveted and soldered Ice Cream Cans "Buhl Quality" has for thirty-five years been the standard upon which real worth and value have been measured. The same confidence will apply to the new "Buhl Electric Allweld" Ice Cream Cans.

"Allweld" Cans are assembled complete before tinning. They are then thoroughly and smoothly "Hand Tinned" by immersing into several baths of absolutely pure molten "straits" Tin. This protective coating or plating of tin along with the special steel used, made under a formula known to have exceptional rust resisting qualities, insures a Can capable of withstanding the corrosive effects of salt and brine.

"Allweld" Cans are made throughout of the best steel procurable—of a very stiff nature (not overly hard) but just the right temper to withstand the severest service—difficult to dent thus insuring "Allweld" Cans retaining their original form and capacity.

Should it be desired to retin the "Allweld" Cans after long service it can be done easily without disassembling.

Beaded Top Hoop
—Electrically welded to cylinder, cannot be removed—forming double thickness absolutely sealed tight into solid mass at top edge by tremendous pressure.

Extra prominent bead—easy to grip—edge sealed tight—no solder.

Cylinder side seams continuously electrically welded—much superior to gas welding as does not crystallize metal. Smooth and sanitary—no solder.

Bottom pressed to side of cylinder with 200,000 pounds pressure by a special process avoiding fracturing or crystallizing the steel. Electrically welded to cylinder—no solder—perfectly smooth, no crevices. Flange of bottom extends to bottom edge of cylinder.

Bottom hoop—heavy gauge band steel expanded on inner flange of bottom forming triple thickness of heavy steel at bottom, protecting bottom edge from damage. Bottom hoop electrically welded to can. Perfectly tight—no opening.

Patent applied for.

NATIONAL CONVENTION—NEW ORLEANS—NOVEMBER 17-20, 1924.

members of the Pennsylvania association, told his members at their annual convention in Atlantic City:

"There can never be a time when we can afford to be satisfied with what has been done for the betterment of the Pennsylvania ice cream industry, either from within or from without. Always we shall have before us, individually and collectively, work that is important to the continued advancement of our business."

GOOD ice cream laws have helped Pennsylvania guard against inferior products coming upon the market. The public knows that it can depend upon Pennsylvania ice cream.

A stringent law was passed by the legislature, and approved by Governor Pinchot on March 20, 1923. The act follows:

Section 1. It is unlawful for any person, association, partnership, or corporation, by himself, herself, itself, or themselves, or by his, her, or their agents, servants, or employees, to sell, offer for sale, expose for sale, or have in possession with intent to sell, ice cream, including coated ice cream and the coating thereof, which is adulterated within the meaning of this act.

Section 2. Ice cream, including coated ice cream and the coating thereof, shall be deemed to be adulterated within the meaning of this act:

First, If it contains boric acid, formaldehyde, saccharin, or any other added substance or compound that is deleterious to health.

Second. If it contains salts of copper, iron oxide ochres, or any coloring substance deleterious to health: provided that this paragraph shall not be construed to prohibit the use of harmless coloring matter in ice cream, when not used for fraudulent purposes.

Third. If it contains any deleterious flavoring matter, or flavoring matter not true to name.

Fourth. If it contains any fats, oils, paraffin, other than milk fats, added to, or blended, or compounded with it: provided, however, that chocolate ice cream and the coating of coated ice cream may contain cocoa butter.

Fifth. If a product is manufactured which is an imitation or a substitute for ice cream, and is offered for sale under any coined or trade name.

Sixth. If it is offered for sale from any container, compartment, or cabinet, which contains any article other than ice cream.

Seventh. If it contains less than eight per centum butterfat, except when fruits or nuts are used for the purpose of flavoring, then it shall not contain less than 6 per centum butterfat.

Section 3. It is unlawful for any person, association, partnership, or corporation, to sell, offer for sale, expose for sale, or have in possession with intent to sell, an ice cream, including coated ice cream and the coating thereof, in container which is falsely labeled or branded as to the name of the manufacturer thereof, or to misrepresent, in any way, the place of manufacture of ice cream, including coated ice cream and the coating thereof, or the manufacture thereof.

Section 4. Any person, association, partnership, or corporation, violating any of the provisions of this act shall be guilty of a misdemeanor, and, upon conviction thereof, shall be sentenced to pay a fine of not less than \$25, nor more than \$100; or in the case of an individual or the officers and members of an association, partnership, or corporation, to undergo an imprisonment of not less than 30 days, nor more than 60 days or both.

PENNSYLVANIA stands at the top in many lines of activity.

Its record in the late world war was one to give pride. It leads in many trade pursuits. It has an enviable record in educational achievements. Probably no other state in the union has so many educational institutions conducted by the state. Among the Pennsylvania schools of higher learning is the Pennsylvania State College at State College, Pa. This institution is particularly close to the dairy manufacturers.

Besides having regular college courses to train workers in dairy manufacturing, this college offers, each winter, a short course open to any student interested in the work. Last January marked the thirty-first creamery short course. Pennsylvania dairy manufacturers are singularly fortunate in having such a splendid school for the training of its workers. When the first short course was installed the instructors thought all necessary would be a course in the separation of milk and buttermaking, but now the course includes ice cream making, cheesemaking, the manufacture of condensed and powdered milk, dairy bacteriology, etc.

DURING the past year the college bought from farmers 2,607,436 pounds of milk and 162,944 pounds of cream.

Packages Improved

Mojonnier Ice Cream Packaging Machine in use in the well-known plant of H. P. Hood & Sons, Inc., Cambridge, Mass., packaging quart cartons. Note chute arrangement for quickly conveying "Arctic Sweethearts" to machine.

Model D Mojonnier Ice Cream Packaging Machine. Patented Dec. 17, 1918, Aug. 19, 1919, June 22, 1920, June 21, 1921, and Dec. 11, 1923. Other patents pending.

This machine is the ideal machine for plant with limited brick business. Any style of carton may be filled on it either standard tuck-end carton, quarts or pints, Sealright quarts or pints, Arctic Sweethearts, Mono Service, Menasha, Sundaes, Purity Paper Cans, Dixie Cups, etc. Fills 500 quart cartons or 1000 Arctic Sweethearts per hour.

Users of the Mojonnier Packaging Machine have informed us that their quart and pint bricks and individual packages are more evenly filled and of a more uniform weight, than when packaged by hand; that the "rattly" old brick is eliminated entirely; and in its place, a full fat brick is produced.

The "Mojonnier" is now manufactured in seven models,—a size to fill every need. No business is too big,—no business too small for a "Mojonnier."

Mojonnier Automatic I C E C R E A M Packaging Machine

has many advantages. We enumerate four:—

- 1st. Fills exact measured quantity of ice cream into any size or type of package.
- 2nd. Untouched by human hands.
- 3rd. Good flavors sealed in—bad flavors sealed out.
- 4th. Insures "fine bulk texture" in brick ice cream.

Over two hundred now in use. Write for further information and user nearest you.

Philadelphia Manufacturers Advertise

Quality Ice Cream and Advertising Have Given the
Quaker City Nearly One-Tenth of the Country's
Annual Consumption of Ice Cream

ALTHOUGH the population of New York City is three times that of the Quaker City, over three times the amount of ice cream is consumed annually by Philadelphians. Nearly one-tenth of the annual consumption of ice cream in the entire country is produced in Philadelphia.

Philadelphia ice cream manufacturers claim that the uniform high quality of their product is responsible for this ever-increasing demand. Advertising, however, plays an important part in establishing these sales records. Probably in no other city is ice cream advertised so extensively as in Philadelphia. The words "Ice Cream" are almost constantly before the eyes of the people, whether they are driving along the highways, walking on the streets, riding on street cars or perusing the columns of their daily newspaper. Bill boards, window displays, hanging signs, fountain signs, newspapers and in fact every other conceivable medium of advertising is visualized to spread the message of ice cream.

It was estimated by an ice cream man, who personally contracts for the advertising done by the leading firms here, that approximately \$125,000 was spent by the five largest concerns in newspaper advertising space alone last year. Some of the brainiest and best known advertising men and firms in the country, contribute the copy.

With the competition in Philadelphia exceptionally keen, these experts have been taxed almost to the limit

to supply new ideas and different "slants" and angle on the subject. Theirs is no easy job. Each firm has its own particular style of copy, and size of space used, and general make-up of ad. For example, Breyers' always use one full column, while Supplee-Will-Jones invariably use considerably larger space than the others and their ads always carry a distinct border design.

CRANE'S
Philadelphia
ICE CREAM

for 28 years The
Aristocrat of Philadelphia Ice Cream

City Hall was still young; "century runs" on "safety bicycles" were the popular sport — when Crane's was born. Crane was the first to lift ice cream making to the plane of a science. Crane set a new standard in ice cream quality—a reputation which has endured these many years.

Newspaper "Copy" recently used by the Crane Ice Cream Co.

Abbotts and Cranes vary the size of the space used, while so far this year, Colonial has done very little newspaper advertising, but like the rest, do generous outdoor advertising.

Oftentimes two and three large ice cream advertisements appear in a single issue of a Philadelphia newspaper. The readers couldn't miss seeing "ice cream" if they tried.

That it pays to advertise can readily be determined by the consumption figures credited to the city of brotherly love.

"We show faith in our product by doing extensive advertising"—that is the point brought out by the firm that does the greatest amount of advertising. Sounds logical, doesn't it?

Not An Idle Dollar in the Plant

Willow Brook Dairy Company, Mount Vernon, N. Y.

WHEN the amount of money an owner is willing to invest in his Dairy and Ice Cream Plant is marshaled before us we closely inspect every dollar, with an eye to its place in the general plan.

Each dollar is asked the question, "Are you needed, or have we enough without you?" Then those accepted are placed where they can do the best service—in the building or the equipment.

No idle dollars—every one at work. That is the result of starting right—knowing just from the beginning how to avoid waste and compel operating costs to make way for profit. Specializing for years in one industry enables us to do this for all our customers.

New York Produces 20 Million Gallons of Ice Cream Annually

Empire State is Second in Ice Cream Production and Holds High Position in Dairy Manufacturing

NEW YORK is second among American states in ice cream production. It is only to be expected that the Empire State should maintain the same high ranking in the ice cream industry that it has in most other industries.

New Yorkers are consumers of ice cream. Much of this is due to industrial prosperity, but it is significant that New York ice cream manufacturers are among the leaders in affairs of the National Association of Ice Cream Manufacturers and at the conventions of these associations have much to say about the proper methods of operating an ice cream factory.

New York not only is up to the front in ice cream production but also ranks high in the manufacture of other dairy products. Until Wisconsin forged to the top as America's leading state in dairy manufacturing this place was held by New York.

Figures are not available for New York's dairy production in 1923. But in the June, 1923, issue of The Ice Cream Review figures from the Department of Agriculture revealed that New York the year before manufactured 20,713,000 gallons of ice cream. This was more than that produced in the state of Maine, Maryland, Massachusetts, Minnesota, Michigan and Missouri combined. It was more than that made in the New England states.

For that year New York also produced 25,474 pounds

of creamery butter and 754,000 pounds of whey butter. Its cheese factories had an output of 47,726,000 pounds of American cheese, 2,060,000 pounds of Swiss cheese, 1,546 pounds of brick cheese, 4,356,000 pounds of Limburger cheese, 6,111,000 pounds of Neufchatel cheese and 761,000 pounds of Italian cheese. This gives New York a total cheese production of 66,525,000 pounds, not including cottage pot cheese, of which 12,871,000 pounds were made. New York manufactured in that year 332,051,000 pounds of condensed and evaporated milk.

NEW YORK was one of the first states to have a state association of ice cream manufacturers. The Association of Ice Cream Manufacturers of New York State has been an exceedingly useful body in promoting the welfare of the industry. Its members number some of the most advanced ice cream manufacturers of the country.

The 1924 president of the New York association is Vernon F. Hovey of Schenectady, who also is president of the national association. It is a favorite trick of the national association to pick much of its official timber from the rank and file of the New York association.

The New York association is conducted under advanced trade standards. Its members recognize and practice ethics of the highest form. The association has stood for quality ice cream. It has spread among its members an understanding that the industry could not advance in their state for anyone unless every member should make the best ice cream possible.

Many state associations would do well to study the work of the New York association and the results it has brought about. New York is one of the wealthiest states in the union, but instead of this being one of the reasons why ice cream is largely consumed, it is easier to believe that New York is a wealthy state because it has among its citizens business men who do things with the sincerity and earnestness of the officers and members of the Association of Ice Cream Manufacturers of New York State.

IN addition to the state association there is another association which works for the interests of the manufacturers of New York City and surrounding cities, including Newark and Jersey City. This is the Metropolitan Association of Ice Cream Manufacturers. The president is W. C. Van Cleef of the J. M. Horton Ice Cream Co., New York City, and the secretary is W. H. List, Puritan Ice Cream Co., Newark.

\$75,000 FIRE IN NEW ENGLAND PLANT.

It is estimated that a loss of \$75,000 was caused to the ice cream plant of H. P. Hood & Son's at Cambridge, Mass., the night of April 4. Starting in or near the paint shop on the third floor of the plant, the fire spread rapidly and also caused considerable damage to the machinery on other floors. A large amount of the machinery on the second floor, valued at more than \$35,000, was badly damaged by water.

Officials of the company had not advised The Ice Cream Review their plans for the future when this issue went to press.

Liquidation Sale

Only a few items left at this modern ice cream plant that was operated for only a few months:

- 1—2,000 gal. Pfaudler glass lined jacketed tank.
- 1— 500 gal. Pfaudler glass lined jacketed tank.
- 1—1,000 gal. Pfaudler plain glass lined tank.
- 2—Pfaudler ice cream hoppers 15"x60"x30".
- 4—Creamery Package batch measures for 100 qt. freezers.
- 3—Champion No. 11-H Ice crushers, hopper type.
- 75 ton brine cooler—791 sq. ft. cooling surface.
- 1100 gal. per hr. Whitlock hot water heater.
- 100 ton brine cooler—1,080 sq. ft. cooling surface.
- 20 stands De La Vergne atmospheric ammonia condensers, latest type.
- 12x10x10 Pennsylvania air compressor.
- 2—500 g. p. m. Union centrifugal pumps, direct connected to 10 H. P. Westinghouse motors.
- 35,000 lineal ft. of 2" and 1 1/4" hardening and ice storage room piping with return bends.

Sanitation is Stressed in New Jersey

Something About the Inspection of Ice Cream
Factories in New Jersey

THERE are 600 firms making ice cream in the state of New Jersey, manufacturing, according to conservative estimates, about 8,000,000 gallons annually. Twenty of these establishments engage in manufacturing on a large scale, wholesaling their product to dealers in nearby cities and towns. The balance are small manufacturers, who manufacture either for their own store or fountain trade, or for special catering orders, etc. In addition, there are some fifteen wholesale manufacturers, whose plants are located outside the state that deliver their product in New Jersey.

Each factory must obtain a license from the State Department of Health, based upon compliance with the rules and regulations of the department. Those factories located outside that deliver their product within the state, also must obtain a special permit based upon inspection and satisfactory maintenance of their buildings and equipment.

The inspection of these factories by the state health department was begun in 1911 under an amendment to the "creamery act" of 1906. Since that time there has been a steady improvement in the sanitary condition of these factories, and much progress is still going on. The work is under the direction of Walter W. Scofield, Jr., chief of the bureau of foods and drugs. Mr. Scofield's manufacture of ice cream. The construction of the field is assisted by his corps of inspectors and also has the co-operation of the local health departments in the larger cities.

The principal points covered in the inspection of factory are the character of the raw materials used in manufacture, viz., cream, milk, gelatine, cocoa, colors, flavoring extracts, etc. The law prohibits the use of cocoanut oil or other fats other than milk fat in the building, floors, drainage, smooth interior surfaces, satisfactory toilet facilities, etc., are regulated. All cans, apparatus and equipment must be of smooth construction and clean. Adequate cleansing facilities for all ice cream cans, freezers and other equipment must be provided. Employees must be clean in their habits and wear clean outer clothing.

IN 1922 a law was passed making a standard for ice cream. Section 2 of Chapter 5 states: "Ice cream is hereby defined as the frozen product made from cream with the addition of milk or milk products or eggs, fruit juices, or nuts with or without sugar or artificial flavoring or colors. It shall contain not less than eight per centum of milk fats, except when the ingredients include fruit, nuts or eggs, in which case it shall contain not less than six per centum of milk fats." Samples of ice cream are collected by the inspectors for analysis. When a product is manufactured for sale which is below the state standard, the manufacturer is liable to a penalty of fifty dollars for the first offense.

In the northern part of the state, there is an association called the New Jersey Retail Ice Cream and Confectioners' Association, which, in the beginning, co-operated with the department in urging its members to conduct their establishments in a sanitary manner. The larger factories, too, have expended large sums of money to improve both their factory lay-out and the purity of their product.

The state and local health departments are on the alert to see that ice cream is manufactured under proper sanitary conditions and are pushing their efforts to this end. They believe that "ice cream is good enough to be made in a good factory."

We want to remind you that if you do not find advertised in this issue what you are seeking, it will cost you only 2 cents a word to let the world know through "The Ice Cream Review" what you want. Get busy before the other fellow gets ahead of you.

Progressive Ice Cream Manufacturers in New York, New Jersey and Pennsylvania, find U. S. Heavy Duty Freezers The Best in the Long Run

Colonial Ice Cream Company, Philadelphia, Pa.

This Company first took one U. S. Heavy Duty Freezer on a trial basis only a few years ago. They are now using 160 quart capacity U. S. Heavy Duty Freezers. "Colonial Ice Cream" enjoys an enviable reputation over a large territory. They are one of the very largest wholesale ice cream manufacturers in the East, and their output is measured in millions of gallons per year.

Smith Bros. Ice Cream Company, New York City, N. Y.

Smith Brothers Sanitary Ice Cream is all made in U. S. Heavy Duty Freezers equipped with Hyatt Roller Bearings and U. S. Automatic Batch Weighers. Their whole plant is up-to-the-minute in every respect. They are prosperous and growing rapidly. Mr. M. L. Smith, speaking of his experience with U. S. Heavy Duty Freezers said:—

"The U. S. Freezers work fine. We never have any trouble with them. In the other machines we had before, we had a lot of trouble with the gears, and the bearings running hot. We have never been bothered that way by the U. S. Freezers. We always get a good overrun—a little better than with the others. No matter how hard we work them, they always stand up. Nobody can go bad on them. There is nothing wrong with them."

KEYSTONE DAIRY CO., Hoboken, N. J.

Showing their 2 Giant 160 Qt. Capacity Up-to-date U. S. Heavy Duty Freezers with U. S. Automatic Batch Weighers, and the 5 older Commercial 40 Qt. Capacity U. S. Freezers they Started with.

The above picture of their plant shows their battery of U. S. Heavy Duty Freezers in operation. The two Giants on the left are of the latest design, fully equipped with Hyatt Roller Bearings and U. S. Automatic Batch Weighers. Their story is best told in a letter we have from them, and is so good that we are reproducing part of it here in their own words:

What the Keystone Dairy Company, Hoboken, N. J., Say in a Letter

"We at first hesitated about installing your 160 quart freezers from fear that the overrun would vary too much during the drawing of the frozen batch, but we are pleased to say that from tests made on our Mojonner overrun tester, we find only slight variation, in fact it is less than found in a similar quantity drawn from 40 quart machines.

"We are particularly well pleased with your Automatic Batch Weigher, which has worked perfectly, giving us always a uniform batch.

"Wishing for you the success that your high class machines deserve, we are

Yours very truly, THE KEYSTONE DAIRY COMPANY. (Signed) William M. Kroog, Treas. & Gen. Mgr.

Satisfied Successful Users Everywhere

Many other ice cream manufacturers not only in New York, New Jersey and Pennsylvania, but all over the country have us have pictures of their plants and given us letters of recommendation expressing their great satisfaction derived from using U. S. Heavy Duty Freezers. Many of their plants are illustrated and described in our 1924 catalog and many of their opinions quoted.

We will gladly give you the names of those near you, so you can ask them what they think about U. S. Heavy Duty Freezers.

Showing the Dealer How it is Done

Dealers are Shown Methods of Manufacture
at Anniversary of the Abbott
Ice Cream Co.

THE Abbott Ice Cream Company of Philadelphia, Pa., celebrated its fifth anniversary the week of March 17 to 22 in a manner most befitting the occasion. In appreciation of the co-operation given the firm, which has enjoyed a steady growth since its birth five years ago, an elaborate program of entertainment was arranged for dealers and their families that will long be remembered by the more than four thousand persons who attended. The entire plant was placed at the disposal of the visitors while no expense was spared by the company in making the week one round of mirth and jollification.

In fact virtually every modern method of entertainment was supplied including movies, radio, high class vaudeville, community singing and, what proved equally

as interesting and novel to most, an inspection tour through the plant while it was in actual operation. To accommodate those who had signified their intention of accepting the hospitality of the Abbott Company it was found necessary to hold afternoon and evening sessions during the entire week.

The visitors upon arrival at the plant were arranged in groups of twenty. A guide was assigned to each group who ushered the dealers through each department explaining as he went along the various steps necessary to produce ice cream. Many marveled at the care, absolute cleanliness and extensive equipment necessary to produce a high quality product such as Abbott's are known to manufacture. And as one dealer was heard to remark: "I've sold ice cream for the past ten years and never gave much thought to how it was made or what went into it. After today I'll have more respect for ice cream and if anyone is in doubt about its purity, I'll know how to talk to him."

SPECIALS made in every conceivable size, shape, design and flavor combinations were on display in the catering department, said to be the most complete in the city. The dealers were reminded that these specials could be made up for any occasion upon 48 hours' notice and that there was a worthwhile profit to them on the business.

A specially designed carton filling machine said to be the only one of its kind thereabouts was the object of much interest. Among other outstanding features in this plant is a completely equipped carpenter shop where the company's tubs and cabinets are designed, built and repaired. The Abbott Company also designs and build its own wagons and truck bodies as well as maintains its own garage repair shop.

AFTER passing through the flavor room, where fresh fruits were on display, the visitors were served refreshments. A large radio outfit and special moving pictures furnished the entertainment. The visitors were then escorted into the main auditorium. Here's where the real fun began. After brief addresses of welcome by W. G. Griscone, vice-president of the company and Ridgway Kennedy, general manager of the plant, the entire assemblage joined in the singing of parodies of popular songs that had been especially written for the occasion. P. D. Coulter, assistant manager, acted as master of ceremonies and introduced the professional vaudeville artists secured from local theaters.

Mr. Griscone briefly reviewed the history of the Abbott organization, which had its inception many years ago when George Abbott moved to Philadelphia to distribute milk from his farm in New Jersey.

The Latest in Ice Breakers

THE photograph shows one of two husky machines recently installed for icing trucks at the new West Philadelphia plant of the Breyer Ice Cream Co. They are used to break "quick freeze" cakes measuring 56 by 27 by 7 ins. and deliver onto conveyors which deliver the broken ice along the icing platform. One machine also delivers to an elevator handling

ice for packing. A separate motor for each machine is mounted directly on the breaker frame and drives through a silent chain running in oil. The picks are of our standard round socket held type, but are of the extra heavy design. The movable front plate, which receives the shock when the picks strike the ice, is made of semi-steel, as is also the drum. By shifting this plate and changing combs, the size of the broken ice can be varied as desired.

Ice cream handling and shipment on a large scale with minimum labor is greatly facilitated by these efficient, reliable Creasey Ice Breakers.

Our engineers would be glad to study your ice handling problem and to recommend the best arrangement for your conditions. Ask for Catalog.

Pennsylvania Association Has Co-Operated Toward Good Ice Cream Legislation

Association Was Formed in 1906 Through Efforts of the Late Robert Crane

By J. W. NEUMAN*

THE idea of forming an association of ice cream manufacturers in Pennsylvania originated during the latter part of 1906, the actual organization being effected in 1907. During 1906 the food officials in Philadelphia, and other cities in Pennsylvania, began to turn their attention to the ice cream industry. The late Robert Crane of the Crane Ice Cream Company of Philadelphia, at that time the largest manufacturer of ice

cream in Philadelphia and one of the largest in the country, anticipated that it was only a question of time when the legislature of Pennsylvania would pass laws regulating the industry; he foresaw the importance of an organization of ice cream manufacturers to work with the food officials.

With this in view he consulted with his very close friend, the late Dr. Edwin G. Eckert, at that time owner of the Acme Chemical and Extract Works of Hanover.

ADVERTISING IN THE ICE CREAM REVIEW IS A GUARANTEE OF MERIT.

PENNSYLVANIA ASSOCIATION HAS CO-OPERATED TOWARD GOOD ICE CREAM LEGISLATION.

(Continued from page 60)

Pa. The doctor, through his business, was acquainted with a large number of ice cream manufacturers in the state of Pennsylvania and throughout the country. Through the influence and instrumentality of these two men the organization was effected. A meeting of a few manufacturers was held in Harrisburg in the latter part of 1906, and it was the unanimous opinion of everyone present that we should have an association of ice cream manufacturers.

Finally, on January 15, 1907, a meeting was called and at this meeting, held in the board of trade's room, Harrisburg, Pa., the Association of Ice Cream Manufacturers of Pennsylvania became a permanent organization. At this meeting there were 25 ice cream manufacturers. The following officers were elected: President, Robert Crane, Philadelphia, Pa.; vice-president, E. E. Rieck, Pittsburgh, Pa.; secretary, Dr. Edwin G. Eckert; treasurer, Porter R. Walker, Warren.

MR. CRANE continued in office as president until his death on March 26, 1923, when Mr. Rieck became president and W. E. Hoffman was elected vice-president. Dr. Eckert filled the office as secretary until his death on November 29, 1914, when the writer was elected to succeed him. The writer was connected with the association from the time of its formation and was third to sign for the formation of such an organization. The association numbers 225, and among its membership many prominent ice cream manufacturers and persons interested in allied lines.

The idea in the minds of the organizers was the formation of an association for the dissemination of information and promotion of the interest of its members in the safeguarding of the industry as a whole.

The Pennsylvania association took an active part in the formation of our ice cream law and has always worked with our food directors for the good of the industry.

Our conventions have always been well attended and our members take an active interest in their association work with results that the association has been able to do a great deal of good for the ice cream industry. We had a number of members from New Jersey, the name was changed, last year, to Association of Ice Cream Manufacturers of Pennsylvania and New Jersey.

The Ann Arbor Dairy Co., Ann Arbor, Mich., started in the milk and butter business about six years ago and this winter the company added an ice cream department, commencing to make high-grade ice cream and ices. The company is doing a nice business, operating ten milk wagons, four trucks delivering milk and butter, and four trucks delivering ice cream. Officials have just ordered a new 100-gallon capacity refrigerating truck. They are now adding a new refrigeration room and machinery. When completed they will have a storage capacity of 6,000 gallons of ice cream and milk.

The plant is operated by Thomas K. Burt, manager, and Chas. P. Stull, superintendent.

He: "Where did you do most of your skating when you learned?"

She: "I think you're horrid."

PHILADELPHIA CO. HAS SALES CLUB.

Few ice cream firms anywhere can boast of a finer spirit of co-operation and loyalty among their employees than has been displayed by the selling force of the Crane Ice Cream Company of Philadelphia. About a year ago, the company's ten salesmen, led by James H. Meehan, director of sales and advertising, formed a salesmen's club, which they named *Entre Nous*, a French expression meaning "among us." The purpose of this organization was to promote a better spirit of co-operation among the members of the selling force. Officers were elected and a certain day set aside each month for meetings.

Realizing that the general appearance of a salesman is of stellar importance, one of the first measures adopted by the club, was to devise a set of daily rules and penalties for their violation, as follows: Unshaved, \$.25; shoes not shined, \$.10; auto dirty, \$.25; accidents, \$.50; untidy appearance, \$.25; tardiness, \$.02 a minute for the first five minutes and one cent a minute thereafter up to ten cents.

Each member pays \$.25 a week dues.

The club became so popular and so much good was accomplished by it, that the heads of other departments in the Crane company, when invited to join, welcomed the opportunity. The present officers are: James H. Meehan, president; Judson Newberg, secretary and treasurer, and George M. Brink, vice-president.

Last year, just before Christmas, the club decided to use the money in the treasury for making up and distributing Christmas baskets to needy families. Considerably more baskets will be distributed next year, it is expected.

The monthly meetings of the club are devoted to the exchange of ideas and discussing pro and con, ways and means of increasing the firm's sales. The members have taken a keen interest in their work and much has resulted from the organization, according to the founder, Mr. Meehan.

CALIFORNIA PLANT COMPLETED.

The Quality Ice Cream & Ice Co. of Redding, Cal., recently completed the erection of their new 160 by 70 brick building. The floors are cement throughout and the plant is splendidly equipped. Their new 18-ton compressor machine has a capacity of six tons of ice cream a day. Frank Avella, proprietor, expects a daily production of 300 gallons of ice cream, although his dry freezer will allow a hundred gallons increase if business should demand it. Two 300-gallon capacity dry pasteurizers are in use, according to report from Frank Avella. The company expects to produce 1,000 pounds of butter daily in addition to their ice cream business.

NEW PLANT.

The Minden Ice Cream Co., Inc., Minden, La., was incorporated for \$15,000. The small plant is modernly equipped with machinery that enables them to produce 100 gallons of ice cream each day. Chas. Finuf, experienced ice cream maker and creameryman, will have charge of the plant.

The cost is little, the results are quick and satisfactory. "The Review" Want Ad way.

EVERY AD IN THE REVIEW HAS AN INTERESTING MESSAGE FOR YOU.

1—Pen Pressure and Position Adjustments

2—Fountain Pen Point

3—Fixed Pivot

4—One Size Chart

5—One Turn Chart Holder

6—Improved Case

Inside the case you will find the reason for the extraordinary ruggedness and accuracy of TAG Recorders. By reason of a patented cam arrangement, the TAG is the ONLY Recorder with uniform chart graduations for ALL ranges. A special seasoning process prevents "setting" of the spiral spring. The development of a single-piece welded bulb and of a capillary tube of exceptionally fine bore are other TAG achievements. The following distinctive structural features also contribute to TAG superiority.

1—Pen pressure adjustment and pen position adjustment, the latter providing an exact and convenient means for correcting accidental bending of pen arm.

2—Fountain pen point writes a clean sharp record line and requires less frequent filling. The non-corrodible pen arm is inverted so that ink cannot run down into operating mechanism.

3—Accuracy of time indications is assured by mounting pen arm on a FIXED pivot so that pen point will always follow radial lines of chart (with clock stopped). Positive pen-arm stops, specially designed clock, convenient clock starter-lever are other features.

4—By standardizing on one best size of chart, manufacturing costs have been reduced making possible unusual refinement of construction at the usual price.

5—Improved chart holder, secured to case by light chain, is attached and removed with a single turn. Charts are printed in green ink on specially seasoned high quality ledger paper.

6—Improved case construction incorporating moisture-proof feature, if desired.

TAG DIAL-INDICATING Thermometers embody the same improved construction and operate according to the same reliable principles as TAG Recorders. The exceptionally easy reading dial is a feature.

Insist on Mercury Thermometers with the TAG-Hespe RED Reading Column

World's Largest Plant Sets Goal at 14,000,000 Gallons

More Than 140,000 Square Feet of Floor Space in New Home of Breyer Ice Cream Co. of Philadelphia

A GOAL of more than fourteen million gallons of ice cream a year has been set by the Breyer Ice Cream Company of Philadelphia for its new plant, said to be the largest in the world. The new plant has a floor space of over 140,000 square feet.

The plant consists of a number of separate buildings such as the ice cream plant, power plant, garage, stable, storage, carpenter shops, paint shops, tin and sheet metal shop, blacksmith shop, ice house, tank room and shipping

Breyer Ice Cream Co.'s New Plant.

house. Approximately five acres of ground situated along the tracks of the Pennsylvania Railroad are used to contain the entire works. The main building, which contains the manufacturing departments and offices, is 176 by 140 feet in size and three stories high, and a basement in addition.

The garage has a capacity of forty trucks and is fitted for repair work. The stable is three floors high and is able to house 250 horses. A blacksmith shop and a harness shop are located in this building. The storage building takes care of 28 forty-ton cars of salt. The power plant, which includes the ice plant, is equipped with two 120-h. p. oil burning boilers. The oil is superheated. Three 10,000 gallon tanks store the oil. At first two hundred tons will be made daily, but the present equipment will allow a 33 1/3 per cent increase. Ice breakers have been installed.

THE main supply of all raw products is received at the railroad siding, large enough for ten cars, but which is located the storage and warehouse. From this building all goods are checked and delivered to the various departments. Railroad facilities make it possible to distribute the finished product in the same manner.

The supply of milk products will be received in glass lined truck tank cars from the various country plants of the Breyer company of which there are five main

Milk Division of New Breyer Plant.

receiving stations. Raw milk received in these tank cars will be immediately transferred to two three-thousand gallon, specially built holding vats. Two motor driven propellers on opposite side of the vat circulate the milk through the direct expansion cooler. As the milk enters the vats it flows over the surface of this cooler.

These vats are but temporary holders, the idea being to receive and properly chill the milk in order to at once check any possible rise in temperature or acidity. The elimination of possible holding of raw milk product in cans is also an important element in the Breyer layout of the handling of their product.

THE pasteurizing and holding room is located on the second floor. At present twelve one-thousand gallon pasteurizers and holders are assembled in this

room. Additional space has been provided for two more of the same size. Two of these vats have been placed on a sub floor level bringing them in close height for dumping of all materials. These vats act as preheaters; while the various ingredients are being assembled they are being heated to a temperature of approximately 110 degrees F. When the entire mix is ready it is at once pumped through two large filters each having a capacity of 16,000 pounds per hour. Then this mix is pumped to the pasteurizer where the temperature is raised to 150 degrees and held for minutes. It is interesting to note that the heating of these two units has been so arranged that when

The plant is equipped with direct expansion coolers, and motor driven viscolizers have a capacity of 800 gallons.

operation is finished which transfers the mix from the preheaters to the pasteurizers, the temperature of the mix will have been reached and the half hour holding period begun at once. Two direct driven Wright two inch diameter centrifugal pumps transfer the mix from the preheaters to the pasteurifiers.

One of the new features of this pasteurizing room is the installation of an automatic and continuous heating system of the water used in pasteurizing. The temperature of this water is automatically controlled and the water is pumped through a continuous heater to the pasteurizers, hence to the preheaters and back to the heater.

The two specially built filters are another unique feature and an important feature in this pasteurizing equipment. The heating, filtering, pasteurizing, holding are now completed and the mix is transferred to the motor driven 800-gallon viscolizers. From the viscolizers it passes over three coolers. It is taken from the coolers (which are enclosed in a glass partitioned room) at a temperature of 38 degrees and piped to the holding vats. These holding vats are in turn cooled by a continuous cooling system in which the water is pumped

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

In choosing the equipment for their new plant, the Breyer Ice Cream Company, Philadelphia, followed the simple plan of buying it from the house with exceptional machinery and a capable organization. If you want lasting, perfect working equipment in your plant, installed properly and dependably, you will not overlook the Cherry Basset Finney Co.*

400 Canal St., Syracuse

through the vats and over a direct expansion cooler, the water being used over and over without waste. The temperature of the vats is automatically held at 38 degrees by a thermostatic control which governs the pumping of the cooled water. This in turn is another new feature of the Breyer installation.

View of the Freezer Room.

quart freezers in the bulk department and three in the brick department, all equipped with batch measures.

The Breyer company is now installing eighteen 100 quart freezers in its old plant, which will give it the largest installation of a certain type of batch measure as there are also 39 of these in addition to 12 special

View of Pasteurizing Room.

FROM the holders the mix flows by gravity to the 100-quart direct motor-driven freezers. Accommodations have been made for the installation of 42 freezers of this size. Thirty-six of these will be devoted to bulk cream and six to brick. There are at present 18 100-

built measures for the measuring and control of chocolate and fruit syrups. The capacity of these 38 freezers will be 23,400 quarts an hour, or 234,000 quarts a day.

The brick department is located on the main floor and consists of two specially constructed hardeners with overhead coils. Each of these rooms is 20 by 30 feet and contains 11,000 feet of pipe. The three 100-quart freezers which are at present installed in this department are located in a balcony as shown by the photographs. They empty into three hoppers fitted with three specially built brick valves for filling slabs.

There are four bulk hardeners with additional room for four more. They are 20 by 30 feet in size with overhead coils and have a capacity of 75,000 quarts or total capacity of 300,000 quarts.

FROM the hardeners to the loading platform, where 13 trucks may be loaded at one time, is the next step in Breyer operation. The ice and salt is fed to trucks by an overhead screw conveyor. Salt is wormed to the ice crusher with each cake of ice and in turn mixed and wormed to the trucks. Two direct-driven ice crushers are installed in the ice storage room.

A fruit and syrup department is located on the second floor in which is ground the vanilla bean used in their vanilla ice cream. In this room also is prepared the chocolate syrup, simple syrup for ices and sherbets as well as the oranges, peaches, berries, etc. All of the various flavors are then stored in glass-lined tanks located on a balcony over the freezers. From these tanks through sanitary pipelines the various syrups are pumped to batch measures which in turn deliver them to the freezers.

This refrigerating equipment is their latest and most modern unit.

The new plant will not replace the old Breyer plant, which had a capacity of twenty-eight million quarts a year, but will be operated in addition.

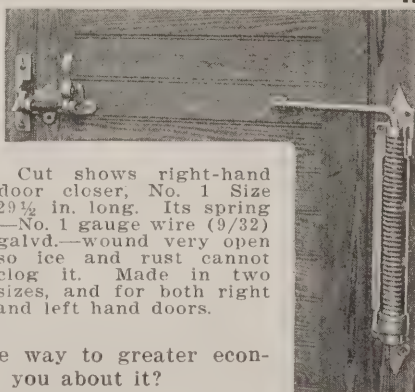

All Breyer Doors are Stevenson Doors as from their beginning

"Service Always Counts"

is no doubt but that the slogan campaign will create greater interest in ice cream and bring more satisfactory results than any advertising the industry has ever attempted heretofore.

If you think you are beaten, you are,
If you think you dare not, you don't,
If you'd like to win, but you think you can't,
It's almost a "cinch" you won't.

If you think you'll lose, you've lost,
For out in the world you find
Success begins with a fellow's will,
It's all in the state of mind.

Life's battles don't always go
To the stronger or faster man,
But soon or late the man who wins,
Is the fellow who thinks he can.

Committee.

PAPER SPECIALTY MANUFACTURERS ORGANIZE.

Ice cream manufacturers will be interested in announcement of the organization of the American Association of Paper Specialty Manufacturers. This body, composed of manufacturers who convert paper into specialties, was formed at a recent meeting, the purpose being to give to the manufacturer "co-operation, standardization, protection and trade information," and the buyer "integrity, quality, fair dealing and perfect service."

Represented in its membership are such articles as paper cans, ice cream pails, paper spoons, parchment papers, paper plates, doilies and paper cups.

W. R. Lenderking, vice-president of the Purity Paper Vessels Co., Baltimore, is president of the association. Other officers are: Karl Becker of the Westfield River Paper Co., Russell, Mass., vice-president; Emil J. Hansen of the Fort Howard Paper Co., Green Bay, Wis., vice-president, and J. E. Willert, 125 W. Forty-second St., New York City, secretary-Treasurer.

TO DISCUSS TRADE ASSOCIATIONS.

Trade associations and their activities will be given attention at the forthcoming annual meeting of the Chamber of Commerce of the United States at Cleveland, May 6 to 8.

Three separate proposals concerning trade associations have been submitted by member organizations of the National Chamber for consideration at the convention. The substance of these proposals, and the organizations that submitted them, follows:

The Memphis chamber of commerce proposes that the National Chamber should advocate creation of a commission which would define the rights of trade associations and their members in all respects, including their rights to discuss operating expense, sources of supplies for materials, prices, trade competition, etc. A study of anti-trust laws and of the Federal Trade Commission's powers and activities would be included. The purpose would be to establish recognized principles which would remove handicaps under which trade associations now operate, through fear that they may violate some law, rule or regulation and be called before a commission or the courts upon a criminal or civil charge the existence of which, regardless of the merits, is detrimental.

A NEW PLANT IN THE NORTHWEST.

The Maid O'Wauna Ice Cream Company, J. P. Breckel, manager, located on the corner of 20th and Main Streets, Vancouver, Wash., is constructing a new ice cream plant throughout.

The plant will be two stories. The first story consists of the office, manufacturing, sharp rooms, order department, loading platform, can washing department. It is all of reinforced concrete. The second floor, which is used chiefly for storage of tubs, cans, cabinets and merchandise, is constructed of heavy mill material.

The ice department, boiler room, compressors, ice manufacturing and ice storage adjoin the main ice cream factory at a slight elevation. This department is all accessible from the ice cream department. The entire building covers a ground space of 98 feet by 88½ feet. The architecture has been patterned after the old Spanish mission with an exceptionally fine quality of stucco and rounded red tile roof together with elaborate flower boxes under all windows fronting on both 20th and Main Sts.; this location is one of the most conspicuous corners in the city of Vancouver and Mr. Breckel, in order to add to the attractiveness of this model building, has provided ample space between the building and the sidewalk line for the planting of shrubbery and lawn, which will give every appearance of a model apartment dwelling without in the least interfering with the convenience in operating the plant.

The building of the Maid O'Wauna Ice Cream Company is now about sixty per cent completed and much of the new machinery is on the ground. Mr. Breckel expects to have the plant completed and in operation by July 1st. All machinery to be installed will be new and of the latest type. The plant will have capacity for five forty-quart freezers and the hardening room will have a capacity of seventy-five hundred gallons and will be equipped with the system designed by J. G. Peck of Portland, Ore.

The mixing department will be equipped at the start with a 200-gallon an hour homogenizer and three 300-gallon pasteurizers and coolers. The ice-making department when completed will have a capacity of twenty tons of ice per day and 700 tons storage. Crushed ice will be conveyed from the crushers direct to the route trucks and also to a newly invented tub packing machine. Salt will be carried in bins at an elevation over the loading platform and will run by gravity to the shipping platform and route trucks. The loading platform opens off on an alley and the loading driveway will be all covered and will be thirty-seven feet wide and eighty-eight feet long; in this section the trucks will be stored and all repairing and servicing done.

The office faces on Main St. and is very comfortable—in fact, modern in every respect. From the manager's office every part of the manufacturing department can be seen.

This new factory is attracting a great deal of attention in the West. Many coast manufacturers have already visited the site and looked over the plans. Vancouver, Wash., being located just 12 miles from Portland, Ore., has a large demand for its product in Portland, though its main volume of business is in Vancouver; this company is also enjoying a large shipping business north, east and west, being so located that it can give these sections desirable service.

You can find the person who will be glad to buy what you wish to sell, by letting your desires be known through an advertisement in The Ice Cream Review.

What goes on while you are away ?

While gone for the day or out visiting your dealers, opening up new locations or settling disputes, the ice cream manufacturer with plenty of Bristol recording instruments about his plant has a definite check on what has been going on during his absence.

From the first temperature of the pasteurizing process, all down the line to the hardening room, the Bristol Silent Watchmen show their handwriting on the wall. Their graphic charts tell where efficiency is being maintained and where someone has been negligent. Their undisputable "evidence" keeps those inclined to need watching on the job while you are gone.

Let a Bristol representative show you many practical ways to use Bristol Recording instruments to advantage for checking efficiency and manufacturing processes. No obligation for the asking.

Indiana Manufacturers Discuss Freezing Conditions

THE ice cream manufacturers of the Indiana Manufacturers of Dairy Products met in Indianapolis March 25 to receive a report of the work done by the research committee of that association for ice cream manufacturers and to make general plans for the coming season. The ice cream topic studied by the committee for the past year was "Factors Affecting the Overrun in Ice Cream." The following factors were studied:

1. Composition of the mix which included butter fat content, milk solids not fat and total solids. Preparation and treatment of the mix which include pasteurization, homogenizing or viscolizing, temperature of mix before freezing and aging of mix.
3. Freezing conditions which included amount of mix drawn into the freezer, brine temperature and pressure, speed of freezer, temperature of outgoing ice cream and type of freezer.

The summary of this work follows:

THE composition of the mix is of primary importance; first, because the physical properties of the constituents are different and second, because the amounts of each constituent are varied considerably in the manufacture of ice cream.

Overrun can be attributed almost entirely to the milk solids not fat, content of the mix.

The optimum amount of milk solids not fat range from 9 to 12.5 per cent depending upon the amount and the nature of other constituents of the mix.

Although milk fat is of great importance as affecting other qualities and properties of ice cream, it has no beneficial influence towards obtaining the optimum overrun. However, too much stress must not be put on this fact since an increase of three per cent fat in an ice cream mix does not materially affect the overrun, while the same increase may more than affect the additional cost that usually comes from the lower overrun because of the benefit to other qualities and properties of ice cream.

The amount of albumen in ice cream is very small but there is sufficient evidence that this substance may be an important factor in controlling overrun.

Sugar is one of the major deterrents of overrun and it is universally recognized that from 13 to 14 per cent sugar in the mix is the most satisfactory.

Binders and fillers have no appreciable effect on the overrun when used in reasonable amounts, with the exception of gelatine which is a deterrent to overrun.

THE method of preparation and treatment of ice cream mixes affect both the physical properties and the chemical properties of the mix and in turn the overrun.

If the mix is properly handled, the necessary overrun can be obtained without aging, although the advantages in favor of aging are sufficient to warrant this practice where possible.

The effect of pasteurization upon overrun in ice cream appears to be solely a matter of viscosity. Because of its greater viscosity a larger overrun is possible from fresh, raw cream than from a freshly pasteurized cream unless some artificial means is resorted to in order to restore the viscosity of the pasteurized cream. For the same reason a homogenized cream, a viscolized cream or an emulsified cream, may yield a slightly higher overrun.

(Continued on page 135)

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

SODA FOUNTAINS OPERATING IN MEXICO CITY.

There are probably as many as ten soda fountains operating in Mexico City, but of these ten only two can be considered fairly large, they being of the twenty-foot type, while the remainder are of the ten and twelve-foot variety. Practically all of these soda fountains are equipped with American made equipment, this being all imported directly by the company operating the fountain. These soda fountains are found in most cases to be operated by restaurants, and they are rarely found connected in connection with drug stores as is the case in American communities. Only one or two of the local drug stores maintain soda fountains and the business done by these fountains is believed to be very small.

Flavoring Extracts and Fruit Juices.

All American flavoring extracts with the possible exception of mint flavors are finding a good market in Mexico, being used by soda fountains, ice cream manufacturers, candy manufacturers, bakeries, and similar establishments. The mint flavor is practically the only local-made flavor which will compete with the imported product. Local dealers tell us that during the last several months flavoring extracts of German manufacture are beginning to once again make their appearance on the market and considerable competition is being felt from this source. Flavors most in demand are those of vanilla, orange, lemon, cherry, sarsaparilla, grenadine, nee-chocolate, grape, mint, mocha, and maple, all of these extracts being imported in case lots, the bottles containing 8 to 12 ounces each.

**GEORGIA PLANT PLANS EXPANSION.**

Five hundred shares of common stock and 1,000 shares of eight per cent cumulative preferred stock, par value common and preferred stock \$100 a share, has been subscribed by the Gate City Dairy & Ice Cream Co., Inc., Atlanta, Ga.

Harry Helmar, president of the company, summarizes the situation in an announcement in the newspapers. The company was established as an individual enterprise in 1914 with an investment of \$2,000. It was conducted as an unincorporated business until 1921, when it was incorporated for \$350,000. Its products under the Gate City brand are said to be distributed in the entire Southeastern states, and purchases of raw milk are made from nearly 400 farmers and dairies throughout the South. The company produced and sold more than 1,080,000 gallons of milk and 324,000 gallons of ice cream in 1923, and a total sales volume of \$625,000 reported. This production is expected to be doubled in 1924, according to President Helmar.

The purpose of this issue is to increase the capacity of the creamery butter department and to provide additional working capital. The company now is establishing stations for the purchase of milk and sour cream in the southeastern states. These purchases will be handled on a strictly cash basis, it is stated.

**WISCONSIN PLANT BEGINS OPERATION.**

The Sparta, Wisconsin factory of the Dairy Food Products Co., is located on the C. M. & St. P. and the N. W. railroads. Between the two lines the company can serve most of the towns within a radius of 50 miles. The plant can handle 500 gallons of ice cream a day. Business already has been begun and the plant is developing nicely, according to E. L. Liddle, who advises that the company has definitely decided on a policy of high class ice cream.

521% increase in Mapleine ice cream sales in 3 years!

Successful ice cream manufacturers in every part of United States use Mapleine. With it, they are sure of flavor the public likes and repeats on.

For example, in 1921 a Chicago manufacturer used 27 gallons of Mapleine. In 1922 his demand increased to where he needed 46 gallons, and last year he bought 130 gallons of Mapleine.

In 1921, 13,550 gallons of Mapleine Ice Cream took care of his demand. Two years later it required 84,206 gallons—an increase of 521 per cent in one of the most competitive ice cream markets.

And Mapleine pays a better profit than strawberry or chocolate, or even a good grade of vanilla. 1½c flavors a gallon of Mapleine Ice Cream. 2 ounces flavor and color 10 gallons of ice cream.

Convince yourself this way

Order Mapleine. Give it a thorough trial. If it should fail to give satisfaction, we will gladly cancel the charge.

Patrons Who Eat a Dish a Day

Every Day Certain Customers Call for a Certain Kind of Ice Cream in a City in Oklahoma. That's the Reason the Quality Ice Cream Co. Has Grown from a Production of 14,000 to 300,000 Gallons a Year.

Uniform Quality Stressed

BUILDING up a class of trade that eats ice cream every day, is the story behind the success of the Quality Ice Cream Co., Tulsa, Okla. Old established ice cream manufacturing concerns throughout the country are all the time trying to develop daily consumption by such lines as "Eat Ice Cream Every Day—It's a Health Food," "A Dish a Day Drives the Doctor Away," "A Daily Treat that Can't Be Beat," and other such slogans.

W. M. Hawk and S. S. Shumway, who are behind the Quality Ice Cream Company, have no quarrel with an slogan aiming to boost ice cream consumption. On the contrary they probably are very much in favor of any thing along this line, but they did not stop with slogans.

The Quality Ice Cream Company started out by living up to its name—Quality. Every effort was made toward uniformity. Consumers were made to feel that ice cream bought from one of the dealers of this company one day would be just the same kind of ice cream that they could get any other day.

The Quality Ice Cream Co. is one of the largest institutions of its kind in the state. It recently was provided with a new home, a modern factory. It is well equipped.

From a small beginning the company grew until the new home was imperative, officials say. It has a freezing capacity of 350 gallons an hour. The company sells to the druggists and direct to the home. It has an extensive home trade.

The plant is equipped with a testing laboratory which permits the operator to keep a constant check on the grade of ingredients used, and to constantly improve the finished product in taste and food value. Fifteen trucks deliver the product.

During the first year of its business less than 14,000 gallons of ice cream was made. In 1923 nearly 300,000 gallons was produced.

EFFORTS TO INCREASE CONSUMPTION ARE PLANNED BY MANUFACTURERS OF NORTHWESTERN OHIO.

The manufacturers of northwestern Ohio are approximately figuring two and one-half gallons of ice cream to be consumed by every man, woman and child in that part of the state. With these figures in mind, manufacturers in this section are completing plans for the biggest ice cream "season" in the history of the state. A district meeting was held in Findlay recently. Endorsement was given the plan to strengthen the sanitary requirements for factories.

John Schubach, head of the Ohio Association of Ice Cream Manufacturers, addressed the sessions.

Crossfield Ice Cream and Creamery Company

Gadsden, Alabama

By J. P. HOLM

A FEW hours ride on the railroad out of big, beautiful Birmingham, rightly called the "Magic City," one gets off at a station where the surroundings look more like a country village with a few hundred people. But after walking a few blocks one is in Gadsden, a modern city with perhaps 16,000 or 18,000 people, wide streets, and street car lines connecting with the neighboring cities of Alabama City and Atlanta. Gadsden is located on a high plateau on the Tennessee River, looks prosperous and is growing. I have no fight with labor unions but mention it in passing, as I noticed it in newspaper reports, that the people rose up against union rule and last fall declared for "open shop."

There are several manufacturing plants, noticeably the Soil Pipe plants. Four such employ about 3,500 hands.

The writer had heard of and read about a chicken man there—rather a breeder of chickens (the feathered kind) on a large scale, so went there to see him and his flocks. His aim—making it the largest not only in Alabama, and the South, but in the whole wide, wide world.

That's all about it, as I'll write for The Ice Cream Review about the Crossfield Ice Cream and Creamery Company here. Before going any further or saying any more, I want to tell the readers of The Ice Cream Review when I get into a city or town, I haven't visited before I visit the newspaper office. Being an old pencil man I like the smell of ink. Some towns haven't a newspaper, so I visit their creameries. Some towns (too many in our great Southland) haven't any creamery, so I visit their graveyard. All have a cemetery. I can hear someone say, "A queer combination." Well yes, but I learn something by it.

After visiting newspapers and graveyards, I came across a very genial bunch of creamery people, but it was evening so I called the next day. The Crossfield Ice Cream & Creamery Company is a closed corporation—a co-operating family affair, and very successful as such. The Crossfields are natives of Kentucky. They

went to Mississippi and tried out several places, but they had to come to Alabama, where there were more and better chances than anywhere else. In 1920 they came to Gadsden. C. K. Crossfield only regretted he didn't come before. They bought out the Lokey ice cream plant. Business was in bad shape, but they overhauled it and creamery machinery was added. Also

new equipment for making ice. While I visited there they were busy enlarging the ice plant to 3 tons' capacity daily. They have up-to-date modern machinery in all departments for the manufacturing of sanitary products, and they have a large patronage. They have doubled the capacity of the ice cream plant since they first took it over. This will have to be done again in the long run. Six trucks operated for delivery and they ship ice cream into all the towns surrounding Gadsden. Their ice cream is

C. K. CROSSFIELD.

MRS. C. K. CROSSFIELD.

good to the last bite, like all ice cream in Dixieland made only of the best dairy products. Ice cream is not a luxury, it is the best food we have and should be served all the day long with every meal, at least and in every family. Get the habit!

THE Crossfields pay the express on all cream shipped to them. They could use at least five times more cream than they receive for making butter and have adopted the Chicago standard plan for paying for butter fat, and pay every two weeks.

The ice output is sold right at the platform. Of course, they use a good deal of ice in their own business. Last season they could not begin to supply the demand for ice regularly.

They cannot supply the demand for creamery butter so far. They are turning down customers every day as they haven't enough butter to supply all of the customers. If they could get more cream, they could make more butter. They are looking forward to the largest year's business they have ever had and feel sure that the ice cream trade will be the largest ever.

ROCKFORD, ILLINOIS

They turn out about 25 tons of ice a day; 60 pounds of butter a week, and made 50,000 gallons of ice cream last year.

I picked up the pictures of Mr. and Mrs. Crossfield in the office. Father is president, mother is the power behind the "guns" home, C. L. Crossfield is manager of the plant, Misses Goldie Crossfield and Julia Crossfield, two charming young women, are ably assisted by Wallace C., as bookkeepers. What the Crossfields have accomplished or are doing, can be accomplished by others who know. Our great Southland offers wonderful opportunities, especially Alabama with her marvelous, wonderful, unlimited undeveloped resources, greatest of which are dairying and poultry, too long neglected. An uncovered field of immense profits waiting for those who venture on a sure thing. Climatic conditions and temperature are ideal and there is good water. Snow but once during the winter. Alabama is "God's Country." Go South!

PS—The Crossfields are not only interested in the material sidethings in life, are not only affiliated with the church of their choice, but active members. The congregation is building a fine new church in a nice location costing \$30,000, and I noticed an old sign which had become a little soiled, so the Crossfields were going to replace it: "This church pays its pastor every week, its janitor every month, and all other bills on sight. It owes no man anything but Love. This good record is possible by reason of prompt payments of dues by all members. Do you owe your church anything? If so, please see the treasurer before leaving the house."

SALESMEN'S CLUB SPONSORS SUMMER SHORT COURSE.

The dairy division at Pennsylvania State College, State College, Pa., and the Salesmen's Club of the Association of Ice Cream Supply Men, will jointly sponsor a two weeks' intensive short course in dairy product manufacturing subjects, largely stressing ice cream, to be given at the college August 18 to 29, inclusive.

Prof. W. B. Combs of Pennsylvania State College will be in charge of academic affairs and the provision of the short course is largely due to his co-operation. Profs. A. A. Borland, M. H. Knutsen, Wm. H. Martin, W. D. Swope and I. R. Knapp of Penn State will assist Prof. Combs.

For this course, under the auspices of the club and college, fifty members of the former will be enrolled. If less than fifty members take advantage of the course, supply salesmen not members of the club will have an opportunity of enrolling.

The headquarters of the Salesmen's Club are those of the Association of Ice Cream Supply Men, 1328 Broadway, New York City.

CALIFORNIA MANUFACTURER ENDOWS HOSPITAL.

Louis J. Christopher head of the L. J. Christopher Company of Los Angeles, California, confectioners and ice cream manufacturers, has endowed a modern hospital in Walscheid, Meurthe-Lorraine, France, his native town, according to recent newspaper reports. Mr. Christopher is one of the veterans of the ice cream industry. Mr. Christopher has made a trip to Europe every year and visited his old country, and, since the war, he has particularly been interested in relief work among his people.

The Iceless Ice Cream Cabinet

By GEO. L. BOEDEKER

THE iceless ice cream cabinet, just now being developed, is, in my opinion, the greatest advancement in the ice cream industry since the brine freezer. This cabinet will completely revolutionize the handling of ice cream by the ice cream manufacturer and also should greatly increase the consumption of ice cream.

For the retailer or dispenser, the greatest saving is made in the elimination of shrinkage that results from ice cream becoming soft from improper or insufficient packing. This shrinkage amounts to practically ten per cent. In these cabinets the ice cream is kept in a firm condition at all times.

The mess caused by ice and salt packing and the time lost by dispensers while waiting for the ice cream man to do his packing is also eliminated.

The soda fountain has a longer life as the ice cream cabinets in a soda fountain are, because of the action of the brine, the first part of the fountain to wear out.

The store has a better appearance, as the iceless cabinets are much more attractive and more sanitary in appearance than the old ice and salt cabinets. No cabinets battered from packing sticks. No leaky drains with an accumulation of salt. No salt soaked floors.

Also a larger stock of ice cream or a better assortment of flavors, can be carried by the dealer, as the ice-

less cabinet takes up but little more than half the space of salt and ice cabinets of the same capacity.

Salty ice cream is entirely eliminated. Cabinets are entirely automatic and require no attention on part of the dispenser.

Bulk ice cream can be served down to the last spoonful, whereas now it is often the case that the last quart or half gallon in a five gallon can is lost as it is almost impossible to properly ice such a small quantity in a large can.

Ice cream sales should be increased because the consumer is served with a uniform ice cream at all times. He is served with an ice cream that has not been re-hardened after having been soft. Such hardened ice cream is, as you well know, grainy, icy, soggy and flavorless. He now gets a rich, mellow, smooth and full flavored ice cream. This will certainly increase the consumption of ice cream.

To the manufacturer, the advantages of the cabinet are even greater. The ice and salt used for the re-icing is entirely eliminated. This amounts to from ten to twenty cents per gallon, depending upon the size of your customer.

The driver can serve an iceless cabinet customer in one-fourth the time necessary to serve an ice and salt customer of the same size. With the iceless cabinet your driver has only to look into the cabinet to see what is needed in ice cream, to go to the truck for the cream, place it in the cabinet, get his money or signature, and drive off. With the ice and salt customer, he has to drain the cabinet, usually into buckets which have to be emptied, then bring in from one to five buckets of ice and salt per cabinet hole, which ice has to be tamped down into the cabinets. Then he must clean up the mess that he has made and often times mop up the floor. One driver can handle more customers. Where you are now using one truck with a driver and a helper, making two trips a day in the summer, you can use the same truck with one man, make one trip per day and add from fifteen to twenty-five per cent more stops. Where you are able to put in cabinets enough to keep a reserve stock, you may be able to double the amount of stops made by the same truck with one man in the place of two. During the winter months, you can arrange to call on your customers twice or three times per week, making

Patented Jan. 21, 1923

rollers and galvanized handles and can be moved from place to place without aid of a delivery wagon, simply by catching hold of one handle and the rollers do the rest.

Baird Refrigerator Bodies Extra Capacity for Peak Days

WHEN desired, the empty can compartment of any Model 10 BAIRD REFRIGERATOR BODY can be provided with a refrigerating pan in the top and with one inch of cork insulation in the walls and doors. Thus equipped, this compartment will hold from 75 to 140 gallons of ice cream (depending on size of body) in good condition for approximately five hours in the hottest weather.

For instance, the Empty Can Compartment of our 350-gallon body, when insulated and refrigerated, will hold 140 gallons of ice cream in addition to that in the ice cream compartment. This gives a total capacity of practically 500-gallons when it is needed—and *without extra weight.*

This is one more reason for buying those good BAIRD REFRIGERATOR BODIES. They mean three degrees below zero—light weight—perfect insulation—and absolutely no brine dripped on the chassis, on the street, or in the garage at any time.

a special delivery should they run out between times.

We have our suburban routes only about thirty-five or forty per cent covered now, and we have three less trucks running this winter than last, with considerably more customers in the same territory. With a partial equipment of these cabinets, we were able to maintain this summer two suburban routes on one-ton Fords that we would have had to put on two-ton trucks, had we not had the cabinets.

You have no complaints of salty ice cream or soft ice cream caused by improper or careless packing, and your dealer is better satisfied as his profits on ice cream are increased, and the disagreeable feature, the ice and salt, have been eliminated.

The saving to you in dollars and cents depends upon your present delivery and service costs. You save your ice and salt that is used for re-icing, and a portion of your delivery expense due to increasing the number of customers that your man can handle. Against this you must figure the cost of the cabinet and its installation, its service up-keep, and the power and water used. The exact saving, as I see it, will not become apparent until the cabinets have been installed long enough to get an idea of their life.

We own the majority of our cabinets. Have them separately metered and pay all of the power and water charges and leave the price of ice cream the same as it has been. Thus the retailer makes the savings from shrinkage and other items mentioned heretofore without any investment or liability on his part. We make the saving on ice and salt and service, less power, water, service and depreciation charges. This may or may not turn out to be very material, depending entirely upon the life of the cabinets.

I believe that our method of handling these cabinets is better than selling them to the druggist, or renting them to the druggist. I also believe that the discount of twenty-five cents (25c) per gallon made by some manufacturers to dealers who own the cabinets is much too large a differential to make. You are giving the druggist more than you can possibly save in the handling of ice cream.

The cabinets are very simple in construction. The unit of refrigeration being a small compressor of approximately one-eight refrigerator ton capacity. Some of these units use ammonia, some SO₂, some Propane, some menthal chloride, and other refrigerants. We are using SO₂ in a Delco Frigidaire unit, and are having fine success. The unit is entirely automatic and will consume from one and one-half to five kilowatts per day, and from four to seven thousand gallons of water per month, depending upon the size of the cabinet and the time of the year it is operating.

Investment varies from four hundred and fifty dollars (\$450.00) to six hundred and fifty dollars (\$650.00), depending upon size and make of cabinets.

The leading soda fountain manufacturers are working hard to perfect a soda fountain that will be entirely refrigerated, and I believe that they will have one on the market in less than a year. As soon as this comes, it will help to reduce the amount that the ice cream manufacturer will have to invest in iceless cabinets. At the present time, they are making what is called a "Fountainette" which has the syrups, wash basins, drains and chipped ice containers consolidated at one end of the fountain and one of the iceless cabinets slipped in the other end. This will do well enough for a small place, but will not do for larger stores where long counters are used. It makes the ice cream too inconvenient to serve.

In my opinion, this cabinet matter has just gotten

started and manufacturers should go into the matter carefully. I feel that you should put in the cabinets, but what I mean is to get into the cabinet game on the right basis. Work with your competitor to see that you do not make any hasty reduction in the prices and see that your cabinets are installed and distributed in a manner that will do each of you the greatest amount of good.

Member: Do you think the iceless cabinet will help to sell packaged goods.

Mr. Boedeker: Yes it will. And the dealer will have more room for a greater variety of goods. Brick ice cream is hard to keep and I believe it is a big issue of the ice cream industry and that we ought to try to get people to carry home a brick of ice cream when they go home for their meals. Putting it into an iceless cabinet will enable the dealer to keep it in good condition and sell more of it.

Member: What is the usual time of operation to cool a five-hole cabinet?

Mr. Boedeker: About one-half time. When a new batch of cream is put into the cabinet the temperature may rise and the machine may run several hours to pull it down again. Ordinarily I believe the machine would run just about one-half of the time.

Vice-President Mathewson: If there are no other questions we will proceed. Undoubtedly we are going to use this type of cabinet. It may take a couple of years to develop it, but it is coming.

Mr. Frick of Corsicana has an idea that he would like to put before the association and we will call upon him now to give us his talk.

(To be continued next month)

CHICAGO PLANT RE-ORGANIZED

The Goldenrod Ice Cream Company, Chicago, is the result of the re-organization of the Lawrence Ice Cream Company, located at 927 West 21st St., Chicago. The new company is incorporated under the laws of Illinois with an authorized capital of \$1,500,000.

Louis Olin, who has been president of the Lawrence Ice Cream Company for a number of years, is president of the new organization. Benjamin Sacks, president of the Lakeside Fish & Oyster Co., is vice-president and treasurer, and G. D. Rose, Chicago attorney, is secretary.

The company does not contemplate erecting a new plant, according to announcement, but it has under construction a new distributing plant at 2206 Ward Street, and another at Harrison and Fifth Avenue. Re-organization consists mostly in the change of the company's name, which was done to take advantage of the large sums of money spent in the last few years advertising its leading brand of cream, the "Goldenrod" brand.

BRUNSWICK-KROESCHELL COMPANY IN NEW QUARTERS.

The Brunswick-Kroeschell Co., producers of refrigeration and ice making machinery, and power and heater boilers, Chicago, has announced that its office has been established in the company's new plant, 4221 Diversey Avenue. All mail should be sent to that address.

If you want help for your factory, the quickest and cheapest way to locate same is through The Ice Cream Review Want Department.

THE old familiar expression "It's a peach!" has been aimed at Emery Thompson freezers for many years by men who use them. Ice cream factories desiring to improve the "fruit of the freezer" and pick bigger profits from their daily business, are invited to write for catalog.

It's a Peach!

The New Emery-Thompson Brine Ice Cream Freezer

"Why have you been telling us all about the details of your machine?" was recently asked us. We have been printing these facts in trade papers because they have a direct bearing upon satisfactory results. You are interested in them only because they mean satisfactory and economical operation.

On that basis we suggest that you secure copy of the Emery Thompson catalog and consider not alone the basic principles that have made Emery Thompson machines a positive success for many years, but also the "little things" such as the slide gate, the cream valve, the fruit hopper, the automatic regulator, the breather tubes, and so on. Here's a machine you will be proud to show to your distinguished guests!

North Dakota Manufacturers and Dairymen Hold Joint Convention

Grand Forks Scene of Meeting Which Was Featured by Interesting Discussions of Trade Topics

ON MARCH 4, the North Dakota Ice Cream Manufacturers' Association held a joint banquet with the North Dakota Dairymen's Association at the Hotel Dakota, Grand Forks. The following day was confined to a business meeting at the Hotel Frederick.

After registration, the meeting was called to order at 10:00 a. m. by President S. J. LaDue, who presented his annual address, which was followed by the annual report of H. K. Geist, secretary-treasurer. A motion was passed asking that a legislative committee be appointed at a later date.

Messrs. Schulte and Landt formed the auditing committee; the nominating committee consisted of Mr. Beardsley, Mr. Christian and Mr. Landt. There was a short talk by J. J. Farrell, secretary of the Minnesota Ice Cream Manufacturers' Association. The morning session was adjourned for lunch and a "talkfest" was held in the Blue Room of the Hotel Frederick, in which everyone present participated.

The meeting was called to order at 2:00 p. m. by the president. "Regulatory Laws in Relation to the ice cream industry of North Dakota" was the subject of the paper presented by R. O. Baird, state food commissioner and chemist. Mr. Baird very ably explained the recent laws enacted by the North Dakota legislature which permit the use of coloring in vanilla ice cream and the use of U. S. certified colors, etc.

J. J. Farrell gave a very interesting address on "General Problems of the Ice Cream Industry." This was followed by the reading of a true statement of facts and figures by the secretary relating to an ice cream manufacturer located in a town of 15,000 people who made 26,000 gallons of ice cream in 1923 at a cost of \$1.12 a gallon and sold this produce at \$1.14 a gallon. Brick, sherbets, pies and punches were included in the statement and thus a deficit was avoided, for it showed that he had sold his product at \$.90 a gallon during the flush season.

G. R. Christian was unable to attend and deliver his paper on "Code of Ethics." The secretary read the code of ethics adopted at last year's annual meeting. Frank O. Knerr read an interesting paper on "Depreciation of Plant and Equipment." A full discussion of this subject followed.

NEXT on the program was the executive session. Nels Baden of Wadena, Minn., treasurer of the Minnesota association, gave some very interesting facts and figures relative to costs, as well as data concerning the aid the association has given in overcoming strained relations between members.

The auditing committee reported the books of the secretary-treasurer audited and found correct as given. On motion the secretary-treasurer's report was adopted as read. The nominating committee then placed the following names before the meeting, and the officers were elected: S. J. LaDue, president, Minot; H. C. Shultz, vice-president, Mandan, and Harry K. Geist, secretary-treasurer, Grand Forks. The board of directors consists of the above named officers and H. C. Christian of Fargo and Frank O. Knerr, also of Fargo.

Harry K. Geist was appointed director to the National Association of Ice Cream Manufacturers. Henceforth the delegate and director to the national association shall be elected from the North Dakota membership each year, in lieu of the president filling this position each year as was previously the case.

The directors were given the authority to later decide on the time and place for the next annual meeting. It was understood, however, that the next annual meeting would not be held with the North Dakota Dairy-

FASTER PUMPING

The improved pumping principle that is used exclusively in the VIKING rotary pump provides a maximum capacity and tremendous suction. For instance, the size VIKING that accommodates a 2" pipe will pump 90 gallons per minute.

This larger capacity with the small VIKING power requirement and its record for operating year after year uninterruptedly explains why there are now over 45,000 VIKING owners.

Kalamazoo Vegetable Parchment Company's Mill, for which we are distributors.

Parchment Service That You Can Depend Upon

In the shipment of your products you are absolutely dependent upon parchment. When your stock runs low you must replenish it quickly; you cannot wait to have the parchment made to order. A 24-hour delay might cost you many dollars.

Draw on Barber's Reserve Stock

We carry the largest stock of parchment in the dairy trade and can make immediate shipment of any standard size of liner, sheet, roll or circle which is used in the wrapping or handling of butter, cheese, milk or ice cream.

Our function is to act as a balance wheel between the user and the mill. When the demand is low we take the mill's supply and store it for the flush season. A mill does not, and cannot, carry a complete stock of parchment in cut sizes. That is why we undertake this service for them so far as the dairy trade is concerned—a service that is of tremendous importance to you as a user.

Let us take care of *all* of your parchment needs. In most cases we can make shipment the same day your order is received.

HUTCHINSON CO. PLANS NEW PLANT IN IOWA.

Officials of the Hutchinson Ice Cream Company of Des Moines, Ia., have been looking over sites in Davenport, Ia., considering the erection of a plant there. The company's Des Moines factory is one of the largest ice cream works in the state, and a large branch is operated at Cedar Rapids.

It is reported that the company is seriously considering the building of this new plant for the manufacture of ice cream and for storage purposes. The plant would supply dealers in this section and probably would extend its operations into cities nearby in Illinois. The large number of improved highways in Scott county, together with the extensive program of hard surfacing in view, will enable the company to expeditiously distribute its product over a radius of many miles. The condition of the roads surrounding Davenport will also enable the farmer-dairymen to deliver their cream and milk into the city in a dependable manner and frequently.

CONE DEPARTMENT

National Ice Cream Cone Week, June 9-14

Plans Formed for
a Widespread
Educational
Campaign

Associations
Co-operating to
Boost Ice Cream
and Cones

NATIONAL Ice Cream Cone Week will be observed throughout the country beginning June 9. After laying plans, at a meeting in Milwaukee, for launching Cone Week on National Decoration Day, May 30, the Cone Manufacturers' Association later decided to postpone Cone Week so as not to interfere with the slogan campaign of the National Association of Ice Cream Manufacturers, which will come to a close on May 30.

Coming almost at the same time, the slogan campaign and National Ice Cream Cone Week loom as the two most important steps in the interest of national advertising of ice cream yet carried out. In pushing the cone to the front, the ice cream manufacturers of the nation are co-operating to give the public a better understanding of the cone as a food companion to America's greatest food dessert. Twenty-three years after its introduction many people still regard the cone as something little more than a fancy container for ice cream. Members of the industry realize the importance of impressing upon the public that ice cream not only is a safe and wholesome food product but also is served in connection with safe and wholesome companion products. Representing as it does an investment of \$20,000,000 the cone industry has made rapid strides in recent years. The production last year is estimated at something over two and one-half billion cones. Special machinery of an intricate and costly nature is required, and great care is exercised in providing cones that will make ice cream more enjoyable and none the less safe and wholesome. These are facts that the ice cream industry now is preparing to put before the public, with the co-operation of the cone manufacturers.

THE idea of Cone Week originated in Minnesota, the starting point of many other bright ideas. President W. Dunn of the Minnesota Association of Ice Cream

Manufacturers has put forth enthusiastic efforts to make Cone Week a gigantic success. After the matter was discussed by the Minnesota association the co-operation of the cone manufacturers was sought. This was readily forthcoming.

Advance preparations for Cone Week provide for streamers to be placed in the windows of ice cream retailers throughout the country, these streamers bearing such slogans as "National Cone Week—Treat Yourself." The Cone Manufacturers' Association has prepared newspaper publicity which will be furnished to any ice cream manufacturer wishing to procure matter for his local newspapers. Information concerning the window streamers and the newspaper

copy will be furnished by The Ice Cream Review upon request.

State association secretaries throughout the country have pledged the co-operation of their associations in putting over Cone Week "with a bang." Much enthusiasm has been manifested by different ice cream manufacturers who have written The Ice Cream Review regarding this matter.

National Ice Cream Cone Week is to be devoted to making a universal appeal to ice cream and cones. Old and young, men and women, boys and girls will be told of the wholesome, delicious qualities of the ice cream cone.

The secretary of the National Association of Ice Cream Manufacturers, N. Loewenstein of Chicago, has been instructed by the president to co-operate with the Cone Manufacturers' Association and other organizations working for the success of Cone Week.

It is felt sure that ice cream manufacturers throughout the country will readily respond to this effort to increase the output of ice cream by making the public better appreciate ice cream and its golden handmaid—the ice cream cone.

Floats Featuring Ice Cream Cones

Several Manufacturers Plan to Open National Ice Cream Cone Week on June 9th by Staging Parades of Trucks Decorated With Cones and Cone Designs.

THE suggestion has been made that National Ice Cream Cone Week be ushered into every city and community with a float parade featuring ice cream cones. Float parades are nothing new to the ice cream industry. In late years members have seized many occasion to decorate their trucks with appropriate banners and designs and parade before the public. The May, 1923, issue of The Ice Cream Review featured the practice by many manufacturers of staging ice cream float pageants, giving a description of how the ice cream are prepared.

Now is the time to do a little effective advertising. People are gradually getting over the idea that ice cream is a delicacy. But the manufacturer must convince them that it is a healthy dessert and should be served regularly during the week, not only on special occasions.

The street parade is very effective manner of advertising. In European countries street parades and fairs have been in vogue for centuries. In fact it is an established method of conducting fairs in Germany, Austria, Russia, Holland, Scandinavia and even some parts of Great Britain.

The Anglo-Saxons, from which we trace our own history, introduced the element of the modern street parade in Rome as early as 500; King Alfred, who was one of the most beloved of English kings, stimulated interest in town fairs and street fairs during his peaceful reign. Booths were built for the miracle and mystery plays in the pre-Elizabethan period, and later the booths were built on wagons and traveled about from town to town. But from the time of the downfall of the Puritans in England, the essential elements of our street parades have flourished. Street bands are still

chief attractions and curiosities. Another form of entertainment which is sometimes seen now is the sketched artist, who drew his caricatures on the side walks.

All these different performances moved about day after day, exhibiting at every corner, and a hat was passed at the close of each performance. Now the shows are drawn into one exhibition, as entertainment for the guest of the street fair, and it is a wise management that gives this entertainment free, and depends for gain on the advertising it will bring.

THE success or failure of the parade may be said to rest upon the number and kind of floats and bands. But it may be said that no street parade was ever a complete failure, and that when it was once held, it was continued the next year.

The free street parade is intended not only to attract a temporary crowd, but what is more important, to make the town popular with the farming community. There are many farmers who live within a radius of, say, 1 mile from two or three towns. The merchants in the towns A and B wonder why it is that the farmers will take the pains to travel five miles further to trade in town C when their prices are less and the roads to the town are better. They do not know the value of "friendly feeling" that the street parade instituted when held in town C this fall, and the merchants in town C have been striving ever since to continue that sort of feeling, and the result is the trade of the surrounding farming districts.

The float is usually the part of the street fair that the individual merchant or manufacturer is most interested in, for the float does not depend upon any com-

mittee, but it does depend upon the creative genius of the manufacturers to put across this effective advertising weapon big. The most common mistake is to make the float too artistic, or have too many details. In either case it fails as an advertising medium, and its power to sell the goods is lost.

An important factor that is often over looked is that it **MUST APPEAR TO ADVANTAGE FROM AN UPPER WINDOW**, and show off well from both far and near.

In design and construction there are so many minor details that the profession of building them is an art in itself, so we asked some of our readers who have been active in street fairs, and not only constructed floats but have also won prizes on them, to give a few practical suggestions to this article. Here they are!

IF WE were to have a float in a parade we would design it to represent a picture of an ice cream cone. If this should not be practicable, with limited facilities I would have cone designs all about the float. This, we believe, would be a splendid advertisement.

For a float one might mount a freezer on a light auto truck; then have several ice cream cone designs attached to the sides of the float; then an operator dressed in a white uniform might pass out samples to the spectators at occasional stops.

The most popular float we ever had was when we gave away individual buckets of ice cream during the parade, this of course made a hit with the kiddies and gave us a lot of good advertising. Cones could be distributed the same way.

Here is one that might help some other fellow. Make a large cone out of paste board and mount it on a table. Then have the prettiest girl in town dressed in a Colonial costume, with little folks around her eating ice cream. The body of the truck could be decorated with green and white bunting so as to show up the more. The size of the cone should be made to fit the truck.

Our idea would be to have a miniature ice cream plant, such as a mixer and freezer at one end of the float, then have children dressed in white following another truck eating ice cream cones.

We would suggest that you have the float represent a huge cone of ice cream. Have the bed of the truck made in cone shape and then mold white cotton to form the ice cream. You could add a little color to this, making it represent cherry or strawberry ice cream. The berries could be made out of cotton and red ink, or some other bright mixture used for the syrup.

We suggest that a picture of a child eating an ice cream cone be used with the inscription reading as follows: **For Your Health Eat Pure Rich Ice Cream Made By Company.**

If we should happen at any time to build a float we would get the biggest truck in town, and decorate it the same in proportion to the event and have this truck loaded down with little children eating ice cream. Then have posters on the truck showing the relative value of ice cream in proportion to other foods.

If we were to build a float we would have a large cloth banner across the top giving the public the name of our ice cream, a row of newly painted and stenciled tubs along the sides, and have the inside of the float occupied with pretty girls eating ice cream cones.

If possible we would get a good clown to give the people catchy sayings about ice cream.

If the writer was building an ice cream float it would be a large ice cream cone which would be large enough to cover the entire bed of the truck. The same would be made of papier mache and hand painted.

Cone Industry Represents \$20,000,000 Investment

More Than Two Billion Cones Eaten Last Year, Quality Said to Account for Industry's Growth

FEW members of the ice cream industry understand the strides the cone industry has made. The manufacture of ice cream as a commercial industry was pretty well underway when the cone made its appearance. Since that time the manufacture of cones has assumed important proportions. Approximately 25 firms are making cones on a more or less large scale. These firms are scattered throughout the country, the locations of the factories ranging from New England to the Pacific Coast and from the Southeast to the far Northwest. A number of smaller cone-making companies are located in virtually every large city.

The cone manufacturing industry represents an investment of approximately \$20,000,000, including plants, equipment and working capital. It has been estimated that something in the neighborhood of two and one-half billion cones represents the consumption for 1923.

The growth of the cone industry is attributable to quality production. Realizing that the future of the industry demanded keeping in step with the ice cream manufacturers in quality, leading cone manufacturers have bent their efforts to manufacturing a product of the highest food value, at the same time with regard to appetizing appeal.

THE first process in making cones in one large factory in the middle West consists of sifting the flour and forcing it into an automatic mixer into which

filtered water is run. To this base are added sugar, milk and certain flavoring extracts. From the mixer the liquid mass flows in sanitary pipes down to the next floor of the factory, where it runs into large tanks beside the baking machines. In the plant of this company there are machines which can best be compared to large wagon wheels about seven feet in diameter. Each wheel is divided into 36 spokes and on each spoke there is a double iron mold. These molds are made in two parts and are shaped like a familiar cone, the outside being a cone-shaped cup and the inside a solid cone.

The machines are the result of many years of experimentation and have been perfected to such a degree that they now run 99 per cent perfect, each wheel turning out 2,000 cones an hour.

Into each open, cup-like receptacle is inserted the inverted pointed piece of metal which presses the dough out in the shape of the cone. Rows of these receptacles run across the machine at frequent intervals. From the time the batter is pressed into the shape of the finished cone, during one revolution of the wheel, until the cone is ready to be dropped, is one minute and 35 seconds. In this time the cone is perfectly baked—both from within and without.

This company, it is interesting to note, has an investment of \$1,000,000 in cone manufacturing machinery—machinery that can be used for no other purpose.

"The future of the cone business," says a large cone manufacturer of the Eastern Seaboard, "depends largely upon the men engaged in manufacturing and distributing cones. If low prices is the objective and quality is sacrificed to make a price, cones will not grow in popularity; but if quality is considered first, we may expect to see the sale of cones keep pace with the increased consumption of ice cream throughout the country."

"When cones were first sold they were largely sold to children. They were made available to children by stands near school grounds. And the proper refreshment offered the child at a circus, picnic or any public recreation grounds always included ice cream cones. Thus in a generation were the children of the country educated to the use of ice cream. It is probable that the ice cream cone is to a greater degree responsible for educating the American public to the use of ice cream than any other one cause."

A manufacturer of ice cream cones in the South a few months ago "put the cone in the movies." This

Food Handling and Public Health

It is not long ago that the interest in food as food was stimulated by the introduction of the "vitamine content phase" of research, which lessened the importance of energy producing food and emphasized the existence of elusive, unanalyzed, unisolated food factors, the absence of which in any dietary results in scurvy, beriberi, or rickets, and accounted for a whole range of deficiency diseases which materially affect personal efficiency and public welfare.

In a remarkably short time esoteric interest in food substance has given way to a rather general realization that scurvy and eye troubles may develop from low fat-soluble, low calcium, poor protein, and unsatisfactory salt combinations; that polyneuritis results from a lack of the water-soluble B which is procurable in yeast, spinach, wheat, soy beans, eggs, milk solids, and cabbage; and that scurvy is caused by a dearth of the water-soluble C which is best derived from fresh fruits and vegetables.

Our knowledge is now ample to guide safely the populace close to the sources of foods; but where questions of preservation and transportation enter into the picture, a wide range of scientific investigations became necessary to determine what vital content is lost by heating, whether a community depending upon cold storage or desiccated products is necessarily subject to vitamine starvation, and how deterioration—whatever the cause—affects food products.

Bacterial Ferments

The relation of bacteria to the food of man is another comprehensive field of research, much of which has centered about milk products—milk, cream, butter, ice cream, and other articles of universal consumption. All milk, today, becomes more or less contaminated at the time of its production. Hence all milk and consequently all butter become contaminated with decomposition and ferment products. In view of the voluminous literature on this subject it would seem that nothing new could be pointed out in connection with the influence of possible incubating temperatures on the qualities of milk, cream, and butter. Nevertheless, Dr. J. M. W. Kitchen, in a recent contribution on "Temperature Control as Related to Improvement in Milk, Cream, and Butter Supplies, and How It Should Be Applied," makes the assertion that the whole world is suffering greatly because of a lack of adequate practical application of information in regard to this subject.

There is not a package of milk or cream, or a pound of butter sold today that is as good as it can be made, according to Dr. Kitchen, because of (1) the uncertainty that exists in regard to the character of all such products as to infections and toxic contamination, and (2) the certainty that all such products are more or less contaminated with putrefactive products. There is no wonder, he says, that these products lack the highest attainable gustatory excellence, or that pediatricists have so little "luck" with bottle-fed babies.

He believes that the preservation of all milk by holding it in insulated containers at temperatures sufficiently high to inhibit bacterial activity will, in the future, replace the use of intensely cold temperatures on which dependence is now placed, and suggests, as

a measure to solve the troubles incident to a lack of uniformity in the production of milk throughout the year, the condensing of surplusage during flush times, coincidentally driving off volatile contaminants, and holding the product by deep refrigeration. The milk thus held would be reconstituted by adding sterile water, the milk being distributed at a temperature but slightly above the freezing point.

Sanitation Plus

Pasteurization is effectual in the preservation of milk when all the residues of bacteria and spores are destroyed by heat, but W. Paul Heath argues that more than the purely sanitary point of view is to be considered. Food values suffer both under heat and under long refrigeration, says Heath, and everyone knows what happens to temperature control during distribution and after the product gets into the hands of the consumer. In an address before the annual meeting of the Pacific Ice Cream Manufacturers, in Portland, Ore., recently, Heath declared that safety is assured and all dangers from fermentation obviated by the simple method of substituting sterile carbon dioxide for the bacteria-laden air which is a constant source of contamination in milk, butter, and ice cream. In extensive research which included a study of minute chemical changes which affect the flavor of ice cream and other milk products, Heath found that important changes, heretofore too little considered, may result from air contamination. In a cubic foot of air analyzed by the board of health of Chicago, more than 700,000 particles of dirt were counted.

Organic poisons from workmen's lungs, body odors, molds, and dusts of all kinds need to be kept out of ice cream, butter, and dairy products if they are to be preserved without loss of flavor or food value. Dairy products contain air bubbles varying from 10 per cent of the volume of butter to 50 per cent of the volume of ice cream, and the period of its purity (and safety) depends upon the bacterial count of the imprisoned air bubbles. The period of bacteria incubation becomes of no importance only when this air-borne contamination can be excluded.

Vacuum processes having failed, the experimentation of Heath led him to replace the air content with sterile, non-oxidizing carbon dioxide, which led to the development of his process of purification and preservation applicable to the churning of butter, the mixing of ices and ice creams, and the packing of milk products in a clean, non-oxidizing atmosphere which results in a sterile product. In a series of tests, air churned butter showed from ten to two hundred times the bacterial count of the carbon dioxide product, the count varying with the conditions of manufacture.

It is interesting to note in this connection that in the beverages notable for their keeping qualities the yeast has liberated bubbles of carbonic atmosphere, while even a thimbleful of air will cause a quart of fruit to spoil on the pantry shelf. Further developments of interest may be considered as assured, for so simple and effectual a means of food preservation, fully commercialized, makes possible the storing and shipment of hitherto highly unstable food products in perfect condition.—Advertisement.

THE ICE CREAM SANDWICH A TWIN TO THE ICE CREAM CONE.

Time was when the word "sandwich" was barred from polite society. A sandwich was a slice of ham reposing between a couple of slices of home-made bread. It was a staple home product, usually found in father's dinner pail or in Jimmie's lunch basket.

Now it is a recognized article of commerce, dignified by competition and devoured in devious ways by high and low. But to make yourself understood when calling for your favorite sandwich you must now specify what kind of a sandwich your palate craves.

The ice cream sandwich may not carry the "punch" that father's ham sandwich did, but it is no less famous and quite as satisfying under the proper circumstances.

The ice cream cone has long been a favorite at baseball games, in theaters, fairs and other places where ice cream is peddled. Its twin, the ice cream sandwich, bids fair to enjoy equal favor in the future because of the recent invention of an ice cream peddling machine, the new Sanisco, Jr. It is constructed to hold one quart brick of ice cream, cutting 14 to 20 sandwiches to a quart. It has ice capacity sufficient to keep the ice cream hard while being served. The loaded machine weighs but 18 pounds.

At a ball game in Milwaukee one of these machines dispensed five gallons of ice cream from 2:30 to 4:00 p. m. At 10 cents per sandwich the receipts totalled \$28.00. Ice cream manufacturers have always appreciated the impetus given to sales of their product by the ice cream cone. They will also welcome a further exploitation of the ice cream sandwich.

Lives of great men oft remind us,
To avoid a life of toil,
Just sell out our Uncle Sammy,
To the men who deal in oil.

Gym.

Hudson's No. 52 Special

FROM an actual dollars-and-cents standpoint, the vanilla flavor that counts most is the kind that not only has a smooth, delightful, mouth-watering taste and a rich, pungent aroma, but a strength and purity which dominates the product until it is consumed.

That's exactly what HUDSON'S NO. 52 SPECIAL is. Furthermore, it comes out of the freezers or packers with its full, original strength.

It is far more economical, too, because of its remarkable strength and its complete solubility.

No better endorsement can be offered than the hundreds of ice cream manufacturers all over the country who have used it for years and who have built up their business and reputation on the outstanding quality of their vanilla-flavored products.

Try HUDSON'S NO. 52 SPECIAL at our risk. We will stake our chance of selling you on your own judgment.

Let us ship you a sample keg of No. 52 SPECIAL extract or a sample gallon of Hudson's Concentrated No. 52—Express or freight prepaid to your city. You may return same at our expense if not entirely satisfactory.

Manufacturers Enthusiastic Over Cone Week Plans

Association Officers and Members at Large Pledge Co-operation in Efforts to Boost Cones and Ice Cream. Dealers Like to Handle Cone Business

MANY ice cream manufacturers give much credit to the ice cream cone for educating the American public to the use of ice cream. It is true that ice cream production has greatly increased since the introduction of the cone nearly a quarter of a century ago. The fact that it competes with the five-cent sellers on the retailers' candy shelves and in the form of soft drinks may give some explanation. The dealer likes this class of trade. Glad to have a sale without having a dish to wash later, he generally gives the customer ordering a cone more than the five cent proportion of ice cream.

The cone has attracted ice cream sales when people would not have time to wait at the fountain to consume a dish of ice cream. Busy office employees often buy ice cream cones and are finished with them by the time the elevator reaches their floors.

However, it seems that the public has not been properly educated away from the idea that the cone is merely a container, a handy, convenient novelty. It is for this reason that manufacturers are receiving with much enthusiasm announcements concerning ice cream cone week. Here is what some of the association officers and members at large have to say:

St. Paul, Minn., March 19, 1924.

A few weeks ago while a number of the Twin City ice cream manufacturers were gathered at an informal luncheon, A. H. Heller of the Northland Milk & Ice Cream Company of Minneapolis made the suggestion that it might be advisable for us to encourage the establishment of an ice cream cone week. This suggestion was energetically received by those present, with the result that all agreed to broach the subject with any cone manufacturer's representative that they came in contact with. I personally have talked with several, with the result that much correspondence has passed between us, and it looks as though this project might be put across as a national event through the concerted action of both cone manufacturers and ice cream manufacturers.

I hope, through the medium of your publication, you will be able to interest enough of the ice cream manufacturers in the country to make the project a success, as it will no doubt create an auspicious opening of the ice cream season each year.

Yours very truly,

W. W. DUNN, Jr.,

Pres. Minnesota State Association
of Ice Cream Manufacturers.

* * *

De Sota, Mo., March 22, 1924.

The idea of a National Ice Cream Cone Week has our most worthy indorsement. The writer wishes to offer this suggestion; same has been tried out by him and only experience can be called the best teacher. We have been selling around 100,000 cones per season, and followed the old law of nature by governing ourselves with the lowest price for cones to comply with the demand of the dealers. When the season of 1923 came on we contracted for a better made cone and with a firm determination called on the trade with this argument that it takes a better grade of cone to sell more of Duffner's delicious ice cream, and to prove the above before the season was over we had sold 225,000 of the better grade cone in a limited territory, and increased our gallonage by a satisfactory margin, and appreciated the fact that we were responsible in giving consumer a pure food product ice cream cone, as well as bringing out the quality of our ice cream, being served in a cone.

DE SOTO DAIRY, ICE & SUPPLY CO.,

dow strips. At the same time we believe we could put a banner on each and every one of our trucks, in addition to carrying this message in our advertising.

GLOBE ICE CREAM Co.,

A. A. Comey.

Vice-President and
General Manager.

* * *

Pottsville, Pa., March 13, 1924.

We most sincerely believe the idea of a National Ice Cream Cone Week will be very fruitful in its results, not only to the cone manufacturer but to the ice cream dealer in the consumption of ice cream and in the stimulated interest in the cone.

Our customers would all like to do more ice cream cone business for the reason that it is a more profitable sales medium for their ice cream than any other now in popular use.

We have always tried to assist our dealers to boost their cone sales with catchy window and counter displays, newspaper advertising and direct mail advertising.

I would, therefore, say that it is our belief that the ice cream manufacturers can and should co-operate with the cone manufacturers for their mutual advantage.

We have not, as yet, worked out the line upon which we shall assist in the National Cone Week propaganda but you can rest assured we are doing everything possible to make it a success.

YUENGLING'S ICE CREAM, Inc.,

T. Earle Smith, General Manager.

Small Sized Vacuum Pans

and Milk Condensing Equipment
for the Laboratory, Colleges and
Ice Cream Mix Manufacturers

Vacuum Pan.

Write
for Prices.

We can furnish these small size equipments in vacuum pan sizes ranging from 8" diameter to 36" diameter, with suitable forewarmers and pump. These small compact outfits require but little space, are provided with suitable heating and condensing capacity and prove a valuable addition for experimental and study purposes as well as for the condensing of small batches.

Arthur Harris & Co.

210-218 N. Curtis St.

Chicago, Ill., U. S. A.

Janesville, Wis., March 12, 1924.

I can see no reason why this should not help ice cream sales and furthermore we should have an ice cream week. Have always been a strong believer in national advertising and the ice cream manufacturers should get together and advertise the one product, "ice cream," educating the public to eat more of it on account of its great food value, etc.

The Fruit Growers' Associations, Southern Hotel Men's Associations and many other associations do this very thing with wonderful results.

I feel that the more publicity we could give National Ice Cream Cone Week through magazines, newspapers, window streamers, truck signs, bill boards, etc., the greater will be the success. One thing in particular must be encouraged, and that is the use of best grades of cones that can possibly be made.

We believe 1924 is going to be a wonderful ice cream year, but let's not wait for business to come our way—go after it and increase the consumption by educational advertising.

SHURTLEFF ICE CREAM COMPANY,

Charles Touton.

* * *

San Francisco, Cal., April 1, 1924.

I will only be too glad to co-operate in this movement by bringing it to the attention of our members and feel confident that the ice cream manufacturers in the territory covered by our association will heartily approve and get behind the movement.

JAY H. KUGLER, Secretary-Treasurer,

California & Southwestern States Ice
Cream Manufacturers' Association.

* * *

Los Angeles, Cal., March 17, 1924.

We believe that a National Ice Cream Cone Week will help materially to stimulate ice cream sales throughout the United States. Ice cream manufacturers should be able to co-operate with cone manufacturers to the mutual advantage of both.

CRESCENT CREAMERY COMPANY,

M. D. Allen, Advertising Manager.

* * *

Meridian, Miss., April 3, 1924.

Our association will be very glad to do what we can to further National Ice Cream Cone Week.

If I am supplied with window strips or any other display matter I will be very glad to send same to members of the Mississippi association.

N. D. BROOKSHIRE, Secretary,

Mississippi Ice Cream Manufacturers' Association.

* * *

Chicago, Ill., March 28, 1924.

I wish to state that the Illinois association has decided to co-operate, in every way, to make Ice Cream Cone Week successful and to aid in a greater distribution of ice cream.

We are taking the matter up more extensively with some of the ice cream manufacturers so that we may go after the matter in a whole-hearted manner.

N. LOEWENSTEIN,

Secretary.

An Absolute

Guarantee of a Better Ice Cream

The Gaulin Homogenizer
Type 400 Motor Driven
Equipped with 2-Stage Valve

Patent Applied For

Manufacturers

Manton-Gaulin Manufacturing Co.
Boston, Mass.

Sole Distributors

Manning Manufacturing Company
Rutland, Vt., New Haven, Ct.

Actual tests made with
the GAULIN 2-STAGE VALVE
have proven that—

- The viscosity or body of the finished mix is absolutely under control regardless of acidity.
- The mix may be homogenized finer than ever before, thereby producing a smoother and richer tasting ice cream.
- No increase of power consumption.

The Gaulin 2-Stage Valve is the only device on the market which can control viscosity, and the correct viscosity is just as essential as thorough homogenization

Literature describing the 2-Stage Valve in detail will be sent upon request

Guarantee: We absolutely guarantee that the Gaulin 2-Stage Valve will produce a finer ice cream than has heretofore been possible.

MANTON-GAULIN MFG. CO., INC.

REMEMBER THE DATES FOR YOUR STATE CONVENTION—AND BE THERE.

The Ice Cream Cone is a Dairy Product

Some Things Dealers and Consumers Do Not Know About Cones. The Cone is a Dairy "Handmaid" and a Fit Companion for Ice Cream

AMERICA is riding to health on dairy products. There may not be any royal road to learning, as one of the ancient teachers declared, but it would be difficult to find a more delightful road to health than by way of the ice cream cone, which certainly is entitled to be called a dairy product.

Back in the olden days of unwise dieting—of silly ideas about what children should eat and grown-ups should avoid—we had more false notions concerning food than were becoming of an enlightened civilized people. Every day doctors are making a lot of money off the foolish ideas that men and women entertained a few years ago. People are taking pills, gulping physics and undergoing painful and nerve-wracking stomach operations, much of this being due to unwise eating.

All of those things cost money. Ignorance always costs money, and many times it costs much more than all the money in the world—blasted health.

The cone is made especially for ice cream. The better class cones are made from pure rich milk and other wholesome ingredients.

THE life insurance company has an investment in human health. It deals in flesh and blood. Naturally, it is to the interest of the life insurance company to keep close tab on the rising and falling tides of life. For the insurance people have extremely good reasons for wanting to see life prolonged. They have equally good reasons for wanting to see good health prevail in the land.

For this reason it is deeply significant to note the importance that the Metropolitan Life Insurance Co., one of the greatest institutions of its kind in the world, attaches to milk as an agent of good health, thrifty habits and long life. The company spends a very great deal of money for advertising. In none of this advertising is any business solicited, and yet when you think of how important it is to this company's welfare that people follow safe and sane methods of eating and drinking, it will readily be seen that this advertising is certainly good business.

"Milk is nature's patent." That is a striking line from an advertisement the Metropolitan Life Insurance Company published in the April number of McCall's Magazine, and several other leading magazines, including the Saturday Evening Post.

THE public has no right to be ignorant of the ice cream cone. Some mothers used to say, "It certainly is hard to keep the children from thinking about those horrid old ice cream cones." Those same children now are healthy men and women, and are wise enough to let their own children eat all the cones they wish.

If every American mother fully understood the ice cream cone, its importance to the child's health, con-

tentment, peace of mind, etc., there would be more youngsters growing up into splendid manhood and womanhood to become builders of the nation.

When the cone first appeared, a score of years ago, many people regarded it as a novel container for ice cream. A few even thought the cone was not to be eaten. Later on, it was found to be very palatable. But even now many people think the cone is just a handy container for ice cream. Such is not the case. The cone is a food. Its just as much a food as the cake that people sometimes eat with their ice cream when there is company. The best thing about it is, the cone is a most digestible food, containing all the important elements that are in the cake without causing the burden of digestion such as heavy, gummy cake causes.

Few people who go into a drug store understand that the best medicine they can buy is over the soda fountain in the form of ice cream; and ice cream is never more palatable than when served in a wholesome, nourishing, appetizing cone.

Many mothers say, "I just wish I could get Johnny to drink more milk; he's such a puny lad." The answer is, let him eat it out of the ice cream cone. In taking it this way, he not only will get the value of the cream, but also of the other wholesome ingredients that go to make up ice cream, and the wholesome ingredients that make up the ice cream cone.

The drug store plays absolutely safe with the public. At one end of the store is the counter where you can buy something that will keep you well—ice cream, best served in the cone. At another end of the counter are sold products necessary to people who just never did make any effort to keep themselves well—drugs. We had rather make a profit by keeping people well than to take profits by seeking to cure people who don't know how to keep well.

IF DOCTORS were to prescribe a medicine that had nearly so much value to it as ice cream served in a cone, people would gladly pay more than a nickel for it.

Can you think of one single thing that you can buy for a nickel that gives you so much for the money?

The ice cream cone is the real bargain at the soda fountain. The customer gets more ice cream proportionately when he buys it in the cone than any other way, for the dealer likes to serve ice cream in the cone. He knows the cone is good, and when he sells it that is the end of the thing until somebody wants another, for there is no dish to wash. Therefore he can afford to put into the cone more cream for the money.

Few people understand how the ice cream cone can solve the problem of lunch in the office buildings. Many girls and young men who would like to cut down on their expenses do not know that they are spending more than is necessary for lunch.

One ice cream cone makes an admirable lunch. That is a fact. It is not generally known, it is true, but an experiment, will show you that one ice cream cone not only will satisfy the appetite, but also will leave one free of that heavy burden of digestion that slows up so many people right after lunch.

More than two billion ice cream cones were eaten in America last year.

Auto Trade is Large Purchaser of Ice Cream Cones

**Cone is Being Recognized as an Edible Container
for Ice Cream and is Especially
Handy for Tourists**

*By HERMAN LAPAT**

AT this time, when, by the sincere efforts of the cone manufacturers in combination with the ice cream manufacturers, much thought is being given to the ice cream cone and the particular week when the public's attention will be focussed on it, it might be well for us to cast a cold, appraising eye on the position of the ice cream cone in the estimation of the public generally today by comparison with fifteen years ago.

As an article of food consumption, the ice cream cone today, retailed everywhere at five cents, is unequal for value and is, in the writer's belief, the only article of food that is being sold at prewar prices today.

The cone as an edible container for ice cream today is recognized all over the land and is without doubt here to stay. Multitudes of novelties have appeared and disappeared, but the cone stays on, due, the writer believes, for one reason to the ingrained love of children to suck and lick confections, rather than to bite them.

The cone industry generally is increasing very rapidly all over the country. This is due to many reasons. First—that the cone manufacturers, more or less, are

guaranteeing their product to be absolutely pure, which instills into the minds of the parents, the feeling that they may be eaten with safety. Secondly—that a nice cone is the natural sum for the average child to possess and to spend. Thirdly—that the ice cream manufacturers are today recognizing that a large distribution of cones materially assists in the dispensing of a larger quantity of ice cream.

The automobile trade without doubt has been and will be in the future a larger purchaser of ice cream cones. It is nothing, to the writer's own knowledge, to see many wayside stands to sell from one to five thousand cones on a Sunday. The candy manufacturer realized the possibilities of this way-side as well as city business, eight or ten years ago to the extent that today there are hundreds of standard five-cent candy packages on the market. These are in direct competition with the ice cream cone, particularly during the summer months. What is better for the child or grown-up during the extremely hot weather—a 5 cent candy bar or a nutritious and delicious ice cream cone?

* Manager Cone Company of America, Chicago.

RICHMOND, VA.

TODAY one can go into San Francisco, New York, Buffalo, and find on the candy counters dozens of pieces standardized at five and ten cents, pure, well and attractively wrapped, whereas the ice cream manufacturers in the past has been, or most of them, indifferent to the vehicle wherein their own good product was conveyed to the ultimate consumer.

Many small ice cream manufacturers today think nothing of buying a carload of cones, which rebounds when wisely purchased to the reputation of their own product and enlarged sales.

The trend of the times, owing to competition, advertising and intensive distributing methods is without doubt eliminating very many of the smaller manufacturers who made cones under conditions that were simply abominable and such publicity as occurred in the Boston Post of August 23 last on its front page, telling the public that a million ice cream cones had been condemned does more damage to the ice cream trade as

"A Franklin Cane Sugar for every use"

the cone manufacturers than may be imagined. The one result of this publicity would naturally lead one to think that hundreds and hundreds of mothers and fathers in Boston and locality would strictly order their children on no account to buy ice cream cones, which means incidentally ice cream.

To such an extent have some ice cream manufacturers realized the importance of distributing a guaranteed cone that they pay their drivers so much commission for every box that they deliver, with the net result that the ice cream sales are going ahead very rapidly.

THE quicker the wall of prejudice is removed against eating out of the hand in public, the better it will be for the ice cream business. It is a peculiar thing that the average man in an average town dislikes to walk down the street eating even an apple, but once that feeling is removed, ice cream manufacturers may look forward to a huge increase in their business, due to the fact that walking down a street eating an ice cream cone is not detrimental to the dignity of any particular person.

It must be the solemn obligation of every ice cream manufacturer to push and cultivate the ice cream cone to the utmost of his ability because it rebounds back on himself in increased gallonage and profit.

The cone industry generally must be brought up to a plane, whereby a house manufacturing them must sell at a given price and not, as has been the custom in the past, the practice of making the cost fit the particular difficulty of selling a certain individual.

There are companies today whose output run into several hundred million cones per annum, but even this huge output is nothing to what may be looked forward to in the future, more especially since the ice cream manufacturer generally is recognizing the advantage of himself of furthering the sale of ice cream cones.

THE DEFIANCE ICE CREAM CO., DEFIANCE, O.

W. C. Hopkins and L. W. Hopkins purchased the ice cream plant from Weber and Harper on October 7, 1922, and business proved so successful that they soon outgrew

Defiance Ice Cream Co.

their plant and formed a corporation, including G. E. Watts. Then they erected a new building, which they went into in March, 1923. The plant is all brick and they are doing a business of 35,000 gallons of ice cream a year. They also do a milk business of 1,400 quarts bottles a day.

The firm is capitalized for \$25,000 and has an up-to-date plant. The officers of this company are: W. C. Hopkins, president; L. W. Hopkins, vice-president and G. E. Watts, secretary-treasurer.

Kicked Into Business

William Drake of Nashville Doesn't Believe in "Kicking Out" Folks; He Got Into Business Through the Kick of a Horse But Made it Pay by Pulling

OCCASIONALLY some man is "kicked out," but it is seldom that anyone is kicked into business. But that's what happened to a Tennessee gentleman. The kick of a horse made William E. Drake one of the leading ice cream manufacturers in the South. Mr. Drake, who, as the secretary-treasurer and general manager of the Union Ice Cream Company, Nashville,

W. E. DRAKE

directs the energies of a \$300,000 investment, told the story of how he got into the ice cream business recently to a representative of The Ice Cream Review.

"I was just a youngster, 17 to be exact, when the incident happened which got me into the ice cream business," Mr. Drake said, and leaned forward in his chair a bit as his memory reviewed the incident. Then he told the story.

When Mr. Drake was 17 and scarcely old enough to be out of school he was engaged for general clerical work in a Nashville bank. The bank was virtually owned by its president, who also owned a small ice cream plant in the city. One day when young Drake had been with the bank but a short time he was summoned to the boss immediately over him.

"How would you like to go out of banking and into the ice cream business?" his boss asked, and explained that the manager of the president's ice cream plant had recently been kicked by a horse and the blow had so utterly deranged him a new man must be found for the business.

"Mr. Blank told me to pick one of you boys here in the bank and send you over to him with the idea of training you up to take over the ice cream plant's management. Its a real chance; do you want it?"

And young Drake, naturally feeling a bit set over the idea, said yes.

Thus the kick of a horse in reality directly made a young bank clerk into an ice cream manufacturer, a manufacturer who has come to be recognized as one of the leading ice cream men in the South.

DRAKE was too progressive and independent to settle down for life in somebody else's business and as soon as he got on to the ropes of ice cream making he branched out for himself. True, it was with a small amount that he entered the ice cream industry, his own account, scarcely more than \$500 to be exact. But he was industrious, worked early and late, and had a knack for making one dollar do the work of two. The result was that within a few years he had built a little business up to the point where it had become a factor in the ice cream industry in Nashville and a consolidation with two other manufacturers was effected.

From a \$500 investment at the beginning William E. Drake now heads an ice cream manufacturing company which represents a \$300,000 investment.

EXPERIMENT TO DISCOVER THE KINDS OF ICE CREAM PEOPLE WANT.

Experiments in ice cream tastes have been conducted by the dairy division of the Department of Agriculture, Washington, D. C., under the direction of Owen Williams. Three persons out of every four, in one experiment, wanted ice cream made with a small quantity of gelatine in preference to that made without gelatine. Another experiment showed that the greater the content of fat in ice cream, the smaller the quantity consumed on the average. In the case of cream containing ten per cent fat, the average consumption was 341 grams a pint while cream with fifteen per cent fat showed average consumption of 317 grams. A pint of cream is equivalent to 283 grams.

In the third experiment, more than 60 per cent of the customers called for ice cream containing 19 per cent sugar and only 10 per cent called for that with 13 per cent sugar.

LET THE WEDDING BELLS RING OUT.

Bert Hillis, Terre Haute, Ind., is receiving the congratulations of his many friends in the ice cream business due to his marriage on March 27 to Miss Nina Hillis of Danville, Ill. Mr. Hillis has been out of the ice cream business for the past three years on account of his health, but is now quite himself again. He has been living in Florida during that time.

What is the difference between a Toreador and a Californian?

MERRELL-SOULE COMPANY QUALITY PRODUCTS

ADVERTISEMENT No. 1
For the interest and benefit of ICE CREAM MANUFACTURERS, we have planned a complete series of advertisements dealing with the production of our chief product, POWDERED MILK.

The Kind of Farms That Supply Our Fresh Milk

BELIEVING that fresh milk of the degree of uniform purity and quality that we demand can be produced only by model, modern dairy-farms, Merrell-Soule has always kept close watch over its source of milk supply.

In addition to co-operating in every respect with the various Public Health Boards with which we naturally come in contact, we maintain, at our own expense, a complete Dairy Sanitation Dept. Experts from this department make unexpected calls at all of our farms at irregular times. They require that every possible precaution be taken to insure the uniform purity of the milk at

all times. The location and condition as well as the equipment of the stables, milk houses, and all other buildings must conform to definite, rigid rules designed to eliminate, as far as possible, all forms of contamination.

So it is that these principles together with other vital factors in the manufacture of our product, that will be outlined in the succeeding advertisements of this series, enable us to offer the ice cream manufacturer a milk powder that is ideally suited to his needs.

Advertisement No. 2 will tell how the milk is received at our plant. Watch for it!

MORE ABOUT THE USE OF EGG YOLKS IN ICE CREAM.

Brooklyn, N. Y., April 10, 1924.

Editor Ice Cream Review:

I have just read with interest the article on the use of dehydrated egg yolk as a filler in ice cream and in relation to quality, in the April issue of The Ice Cream Review and hasten to give you the following information:

We take it for granted that the article in question is based on the findings of Dr. P. H. Tracy, of the Department of Dairy Husbandry of the University of Illinois and as such is the case, would refer you to the article recently reprinted in some of the trade papers by Louis R. Price, president of The Egg Importers Association of America, the summary of which was as follows:—"the assumption that fresh eggs are used in ice cream to improve the flavor and body of the finished product, is absolutely incorrect as eggs are used in ice cream for the purpose of producing French ice cream which is a product totally different from the usual variety on the market." The report states further that "interest in dehydrated yolk is being revived through development of new methods of dehydration." The interest in the use of egg yolk in ice cream is not at all based on the convenient form of eggs that can be supplied, but it is due to the fact that by the use of eggs in ice cream, a stronger consistency is obtained, a smoother texture and a better flavor result. This flavor very naturally owes part of its character to the eggs used and is the flavor desired in so-called French ice cream.

Mr. Tracy objected to the egg flavor in some of the tests but observed that this was eliminated on heating to 150 degrees F. for fifteen to twenty minutes. Since pasteurization is ordinarily practiced in ice cream plants, this would take care of this objection and it seems very unimportant to have referred to this at all.

The results obtained in the investigations of viscosity and overrun are particularly confusing and do not appear to be consistent. By adding egg yolk before homogenization a decrease in viscosity is generally found and when added to the mix, after homogenizing the viscosity will sometimes decrease and sometimes increase. Such results are completely at variance with the results obtained by experienced ice cream manufacturers in their practical work and in the tests conducted under the auspices of the Egg Importers Association by their official chemists, Seil, Putt and Rusby of New York City.

In the matter of texture and resistance, it is not fair to conclude that this effect is simply a function of the amount of solids added and that the same results would be obtained with milk solids as with egg yolk. The addition of four ounces of egg yolk to a 50 pound batch amounts only to one-half of one per cent added solids. Such a change in percentage of solids is insignificant in claims of milk solids, yet the effect of the egg is pronounced for even the small percentage of one-half of one per cent egg yolk is equivalent to yolk obtained from fifteen shell eggs.

The effect of egg yolk is due to its particular colloidal or emulsion form which in turn influences the suspension or emulsification of other substances when the egg yolk is mixed into a batch of other ingredients. Egg yolk has long been recognized as an emulsifying agent of the highest value and not to be compared in that connection with fats or other solids of milk.

Your correspondent further states, in his report, that ice cream manufacturers should not lose sight of the fact that the same results can be obtained by additional milk solids but his own results do not warrant this conclusion. Practical tests made in the plants of leading

ice cream manufacturers throughout the United States have in no instance demonstrated the fact that milk solids could produce the same effect in ice cream as do the dehydrated egg yolks under consideration. It is surprising that an authority of Mr. Tracy's standing should characterize egg yolk as a filler in ice cream. In this connection, it seems unnecessary to refer to the work of numerous investigators who unanimously refer to dry egg yolk as a product of high food value possessing natural salts and vitamins.

On the question of flavor, Mr. Tracy refers to the committee of sixty-seven judges. Judges in such tests seldom render a conclusive report on any flavor. Individual tastes differ so widely that it is quite difficult to obtain definite information from tests conducted on a group even though fairly large in one locality.

Mr. Tracy summarizes the results of his flavoring tests as follows:

	4 oz.	6 oz.
	dehy.yolk	dehy.yolk
	to 50 lbs.	to 50 lbs.
	Control	batch
Number placing 1st.....	24	21
Number placing 2nd.....	19	24
Number placing 3rd.....	19	17

It is difficult to understand just why he should particularly emphasize the opinion of the minority to elaborate upon same. It will be observed that in each of the three tests out of sixty-seven judges, forty-two unquestionably selected the ice cream containing egg yolk, yet, Mr. Tracy says that the tendency was for his judges to prefer ice cream containing the smaller amount or no egg yolk at all.

Dehydrated egg yolks are now sold in the American market on merit and even though they are imported from the Orient, they are manufactured under the most sanitary conditions in modern, up-to-date plants under American supervision.

Yours very truly,
H. I. ROSNER.

"SEASON" TO OPEN EARLY IN NORTHWEST.

The ice cream season in the Northwest will open earlier this year than usual, according to Bert H. Walker, secretary of the Pacific Ice Cream Manufacturers' Association, who looks forward to a big season of business as to volume. Mr. Walker's home town, Tacoma, Wash., has more ice cream factories than many cities much larger, including Milwaukee. All of these plants are looking forward to a large volume of business, we are told.

TEXANS TO MEET EARLY IN DECEMBER.

The 1924 convention of the Texas Ice Cream Manufacturers' Association has been set for the first week in December, according to announcement by A. J. White, secretary of the association. The convention will be held at Dallas. The secretary will notify members of the exact date as soon as dates of other Southern associations are announced. It will be noted that the Texas convention will not conflict with the date for the national convention at New Orleans, November 17 to 20.

Use International Standard Fittings

The Story of the International Standard Interchangeable
Sanitary Fitting

By R. E. LITTLE*

Outline of three years' activities of the joint committees of the Manufacturers of Sanitary Fittings, and committees on standardization of equipment of the National Association of Ice Cream Manufacturers, Allied States Creamery Association, and The International Association of Milk Dealers.

AFTER three years of earnest labor on the part of the joint committee, representing all branches of the dairy industry, having to do with sanitary pipe and fittings, the manufacturers of the fittings, the ice cream, the butter and the fresh milk national organizations, there will be placed upon the market on May 1 by the manufacturers and jobbers of sanitary pipe and fittings, the International Standard Sanitary Interchangeable Pipe and Fitting.

This accomplishment, which stands out as one of the greatest things ever brought into fruition through the co-operation of all parties in interest, is an indication of what can be done in an industry for the material benefit of that industry when all parties have a common vision and are willing and determined through a co-operative program to bring that vision into a reality.

Because of this marked progressive step by the several interests in the dairy industry, it will undoubtedly be of interest to the users of sanitary pipe and fittings, as this standard fitting is about to be placed upon the

* Secretary of the International Association of Milk Dealers and secretary of the joint conference committee.

market, to review somewhat the history of the work, the visions, and the problems and the obstacles that beset those upon whom rested the responsibility for accomplishing such an unusual undertaking. We wish to direct the attention of the user of these fittings to the responsibility that now rests upon him to show his appreciation of that work, of that labor and that vision of those who "blazed the trail" by a determined effort to adopt the International Standard Fitting in their plants just as rapidly as conditions will efficiently and economically permit.

This work was first undertaken in 1920. F. N. Martin, president of the Hazelwood Co., Ltd., of Spokane, Wash., and then president of the International Association of Milk Dealers, appointed a committee under the leadership of T. M. Carlyle, Union Milk Company, Calgary, Alberta, Canada, with whom were associated F. B. Flood, Boadview Dairy, Spokane, Wash.; L. Fred Muller, Union Dairy Co., Rockford, Ill.; Chas. F. Whiting, Whiting Milk Companies, Boston, Mass., and R. E. Little, secretary of the association.

THE appointment of this committee followed a general discussion of the subject following a paper read at our thirteenth annual convention at Chicago, by F. B. Flood. In that address Mr. Flood pointed out that while undoubtedly very marked advance had been made in the science of processing and distribution of milk, that the achievements in milk plant machinery and equipment had scarcely kept pace with the rapidly developing business.

He dwelt shortly upon the need of standardization in all classes of milk plant equipment to a certain extent, but particularly the striking example of sanitary pipe and fittings. To use Mr. Flood's own words, "Every milk plant large or small must use a certain amount of equipment. Iron pipe and fittings are of standard size, regardless of pattern. The product of one manufacturer will fit that of another but the sanitary pipe and fittings found in milk plants are of fifty-seven varieties. In our plant we have no less than seven different makes of sanitary fittings, and none of these interchangeable, and being some 2,000 miles from bases of supplies, it is rather annoying at times to say the least.

* * *

"Seemingly each and every manufacturer endeavors to turn out something different in the line of sanitary pipe and fittings; and it must be said that they are eminently successful. Some manufacturers take the inside diameter to gauge size of tubing. Others, to show originality, use outside measurements. Even though one manufacturer adopts the same diameter another uses, and this he must do because there are only two to choose from, yet he still can be different, because he can vary the thickness of his tubing, making it thicker or thinner than the other fellow's. If he makes it thicker his selling talk is that he makes it stronger, and won't dent by ordinary usage, and if it is made thinner, the

argument produced is that it is lighter to handle. Evidently any variation has its virtues."

THIS was the beginning, and the committee appointed by President Martin immediately proceeded to get busy following a call from Mr. Carlyle. The chairman directed the secretary to make a survey of the field through members' plants and through the manufacturers of pipe and fittings to determine in a preliminary way just what practices then existed and just what problems really presented themselves to challenge the co-ordinated effort of the several interested organizations.

This was done and the chairman called a conference of representatives of the milk dealers and the dairy machinery interests at the offices of the secretary of the association in Chicago on April 18th, 1921.

At this meeting a general discussion was held as to the desirability or feasibility of co-operation between the interests looking towards an educational campaign having in view the beneficial results to be obtained from standardization of dairy plant equipment and supplies.

The representatives of the various interests were unanimously of the opinion that the time was ripe for co-operative action along this line and that steps should be taken by members of the various dairy interests to unite upon some program of co-ordinated effort that would tend to accomplish a more general standardization of dairy plant equipment and supplies.

While the representatives of the machinery interests present recognized the desirability for standardization in a number of lines of equipment, at the same time they did not feel that they were in a position to take the initiative for the reason that the equipment of the present day was the result of the dairy demand and that any changes looking towards a more universal uniformity must be brought about as a result of a crystallized suggestion from the dairy industry followed by an educational campaign, participated in by all interests, having in view the adoption eventually of certain general standards of all classes of dairy equipment and supplies.

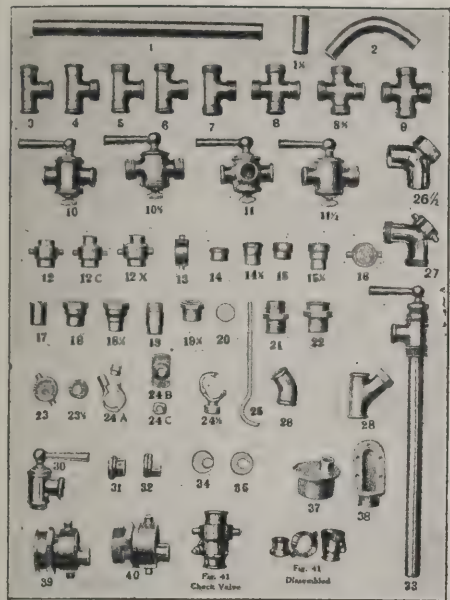

It was the sense of the meeting that a report should be made back to the several interests represented with a view of determining upon some co-operative program as would best serve to bring about these very desirable results.

It was further suggested that this matter be brought to the attention of each of the associations interested in the dairy industry, requesting that the matter be one of their subjects of discussion at their annual convention.

The instructions of this conference were complied with by the central office of the association and at the annual meeting of the International Association of Milk Dealers in October, 1921, at St. Paul, Minn., Chairman Carlyle reported upon the work of the year calling attention to the fact that the several national organizations had promised their full co-operation with the activities of the international committee. Mr. Carlyle closed his report with these significant words: "I believe this report, in a nutshell, means this: The standardization of equipment is in your hands. I don't believe anybody is quite as anxious as some of the manufacturers I have met to have our equipment standardized."

The exceptional work that was inaugurated by this committee was carried forward in the year 1922. E. M. Bailey, vice-president of the Rieck-McJunkin Dairy Company and president of the association, again appointed a committee on standardization of equipment under the leadership of W. H. Forster, The Pure Milk Company, Ltd., Hamilton, Ontario, Canada, as chair-

man, assisted on the committee by F. B. Flood, Broadview Dairy, Spokane, Wash.; C. R. Lindback, Abbotts Alderney Dairies, Philadelphia, Pa.; Dr. D. B. Peck, Bowman Dairy Co., Chicago, Ill., and S. M. Ross, Moores & Ross Milk Company, Columbus, Ohio.

THE National Association of Ice Cream Manufacturers appointed a committee consisting of John Knobbe, McBride Bros. & Knobbe, Chicago, Ill., chairman; H. J. Ayers, Horton Ice Cream Company, New York City; J. D. Kinnett, Macon Ga.; N. Lowenstein, secretary of the National Association of Ice Cream Manufacturers, Chicago, Ill., and Chas. G. Morris, president of the National Association of Ice Cream Manufacturers, New Haven, Conn.

The Allied States Creamery Association appointed the following: Prof. A. L. Haecker, president, Allied States Creamery Association, Lincoln, Neb.; F. W. Crowley, Des Moines, Ia.; J. J. Farrell, secretary, Dairy Products Association of the Northwest, St. Paul, Minn., and W. W. Marple, secretary, Illinois Butter Manufacturers Improvement Association, Chicago, Ill.

The first meeting of this committee was held in the central office of the international association in Chicago on February 9, 1922. The work of the previous year was analyzed and it was decided that the standardization of the sanitary pipe and fitting was the one of most immediate necessity.

The afternoon session was attended by representatives of manufacturers and supplymen, who offered their fullest co-operation in any program that might be adopted looking towards the standardization of the sanitary pipe and fitting.

Chairman Forster requested the manufacturers to send to the next meeting their engineers with blue prints

and sample fittings to work with the joint committee looking towards the development of a standard fitting which would not be the fitting of any one manufacturer but rather a new fitting embracing if possible the most desirable features of all. It would be a fitting uniform as to gauge of tubing, general outline and diameter of fitting and bevel of seat, these being the only features where standardization would be necessary to make such fittings uniformly interchangeable, in all other respects manufacturers to work out their own salvation as theretofore.

It was the sense of the committee that if this joint conference resulted in a fitting that could be the subject of a recommendation at the annual convention of the national organization of the dairy industry that an educational campaign should be engaged in with the memberships pointing out the general demands of the industry and to make it clear that if a standard fitting was adopted that the industry at large must be prepared to replace old and worthless fittings with a new standard as rapidly as operating conditions would permit.

It was also pointed out by both the dealers and manufacturers that the adoption of a standard fitting would involve the necessity of stepping out of the old path, the burden of which has been so onerous in the past and which has caused the dealer to send up a cry for a standard fitting and which has resulted in work of this committee. It was shown that this meant the scrapping of present styles of fittings as rapidly as conditions would permit. Also for the manufacturers of the newly adopted standard fitting it would mean the scrapping of old forms and parts and the making of new ones. The manufacturers graciously stated that they would be only too happy to bear this additional burden, were it the means of giving the industry a standard fitting and them the assurance of the industry that they were prepared to accept this standard fitting after they had gone to the expense of making it, thus squarely placing before the industry the sincerity of their wish to have a standard fitting.

The meeting was adjourned to March 13, 1922, and the secretary was instructed to send invitations to the following firms:

E. B. Adams, Waukesha, Wis.
D. H. Burrell & Company, Little Falls, N. Y.
Creamery Package Mfg. Co., Chicago, Ill.
Davis-Watkins Dairymens Mfg. Co., Chicago, Ill.
Miller Pasteurizing Co., Canton, Ohio.
Mojonnier Bros. Co., Chicago, Ill.
Jas. D. Rawles Co., Boston, Mass.
Specialty Brass Company, Kenosha, Wis.
Wisner Mfg. Co., New York, N. Y.

IT WAS early recognized that in the working out of such a plan, the dealer must be prepared to "give and take" on a broad plane of thinking and also that it must be determined whether if such a fitting is to be adopted, the members must be prepared to buy that fitting for future use, rather than insist on old fittings which would then be in use. Unless the industry was prepared to sincerely adopt a new standard fitting, it would be useless to recommend a new fitting.

The adjourned meeting was held on March 13, 1922, at the Hotel Sherman, Chicago. The following were in attendance:

International Association of Milk Dealers.

W. H. Forster, chairman, The Pure Milk Co., Ltd., Hamilton, Ontario, Can.

Investigation, in the meantime, had developed the fact that from the consumer's standpoint it was universally expressed that the standardization of sanitary pipe and fittings was much to be desired and practically necessary for the welfare of the future buyers of fittings, after which the manufacturers one and all agreed upon a program of standardization and promised full co-operation.

The survey of the industry indicated that there was a universal demand in favor of a fitting specifying O. D. Pipe, Acme Thread with a 45 degree seat or bevel.

It was recommended that 18 inch Gage O. D. pipe should be used for 1 inch, and 1½ inch Tubing; 16 inch for 2 inch, 2½ inch and 3 inch tubing and 14 inch gage for fittings of a larger diameter.

In discussing the type of thread it was unanimously agreed that owing to its sturdy construction and the fact that the fitting could not work unless properly applied, Acme or flat thread most nearly approached the universal demand.

The foregoing particular features were unanimously agreed upon as forming the basis of a recommendation for a standard fitting.

The matter was referred to the engineers, of the various firms, to work out a standard which would be in accordance with the proper mechanical standards, to bring in a recommendation to the joint committees—this recommendation to be submitted in form of drawings showing the detail of the standard fitting in accordance with the specifications laid down by the joint conference.

The engineers were instructed to use the size of union nut which would make the fittings of any one manufacturer interchangeable with that of any other, or in other words, a standard union. This they agreed to do.

It was left to a committee of engineers to submit drawings for further approval, which would be submitted to the joint conference of milk dealers, ice cream and butter manufacturers and then to be submitted to their respective annual conventions for final adoption by their membership at large.

The meeting then adjourned subject to call at the coming annual convention.

THE next conference met at the Curtis Hotel, Minneapolis, Minn., on October 9, 1922, at which time the blue print of the international standard fitting as prepared by the engineer of the conference was submitted and with some few minor changes, was unanimously approved.

Furthermore, recognizing that this standard pipe and fitting would be standard both in the United States and Canada, it was agreed upon to designate the new standard fitting as an international standard fitting, and that the symbol that should appear on the fittings should be the letter "I" within a circle.

The report of this joint conference was submitted to the annual convention of milk dealers and unanimously approved in convention assembled. Similar approval was secured from the National Association of Ice Cream Manufacturers and the Allied States Creamery Association.

It then devolved upon the several committees to take such action with their own membership and with the manufacturers to bring into being the international standard fitting.

However, immediately following the convention of 1923, it was contended that these standard specifications were still susceptible of improvement.

It was the contention that insasmuch as the whole industry had decided upon a standard sanitary interchangeable pipe and fitting that nothing short of the best that human ingenuity could devise would be worthy of such an undertaking.

The industry, represented through the joint committees, agreed with the manufacturers that it would be better to spend such additional time as might be

INDIANA MANUFACTURERS DISCUSS FREEZING CONDITIONS.

(Continued from page 80)

run than a pasteurized cream. In all cases aging the cream usually helps in obtaining a greater overrun.

There seems to be little difference between the effect of low and high grade gelatine on the overrun.

All experimental work indicates that improvers and ripeners exert no beneficial influence on overrun.

THE freezing conditions are very important factors affecting overrun. There seems to be a correlation of the various factors, whereby if one condition is changed, a change must accordingly be made in the other conditions if satisfactory results are to be had. Experimental work has imparted but very little light on this relationship. While it undoubtedly exists, we know very little about it.

It is generally accepted that the colder the mix, without reaching the freezing point, at the time it goes to the freezer, the better. A temperature of 32 degrees F. to 36 degrees F. being recommended.

The true relation or effect of viscosity on overrun remains yet to be discovered. Experimental work to date has revealed that under most conditions additional viscosity of the mix favors greater incorporation of air. However, under some conditions an increase of viscosity by means of certain constituents of the mix may result in a lesser overrun than would have been had they not been used.

The amount of mix in the freezer influences the yield obtained, and the most satisfactory results are obtained from a horizontal freezer when it is about half full of mix.

The incoming brine temperature and the brine pressure should be regulated so that the difference in the temperature between the incoming and the outgoing brine to be about 5 degrees F. and the cream be ready to draw not later than 15 minutes after the mix enters the freezer.

The proper speed of the dasher varies with the size and make of the freezer. Experience has proven as a rule that, with the brine temperature at about 12 degrees F., the best results are obtained where a dasher speed of 200 revolutions per minute is used.

The proper temperature at which to draw the ice cream depends upon the freezing point of the mix. The peak of the swell is reached at the true freezing point, and after the latent heat has been absorbed the actual freezing occurs very quickly, and shortly after the freezing point has been passed the beating down process starts, this is usually at a temperature between 27 and 28 degrees F.

R. L. HAMMOND, secretary of the association, advises that most of the information given in the report was obtained through questionnaires sent to ice cream manufacturers and from studying all the bulletins, etc. which have been issued on this subject. Throughout the report such men as Baer, Williams, Mojonier, Roy and Mortenson were mentioned.

In the absence of F. W. Holmes of Manteno, Ill., his paper on "Cost of Manufacturing Ice Cream" was read by H. W. Fleisher of LaFayette, Ind. In this paper Mr. Holmes brought out the various items of cost which should be considered in the manufacturing of ice cream and emphasized the great necessity of every ice cream manufacturer knowing his cost.

W. A. Fisher of the Delco Light Co., Dayton, O., gave a brief talk on iceless cabinets.

Edible Gelatine

By THOMAS B. DOWNEY, PH. D.*

THE purpose of this paper is to encourage a clear understanding of the functions of edible gelatine in ice cream; especial attention will be given to the nutritive value of ice cream as influenced by the gelatine contained therein.

Edible gelatine is the pure protein-complex prepared from selected white connective tissue in skin and bone of food animals by carefully regulated processes of lim-

DR. THOMAS B. DOWNEY.

ing, washing, extracting with water, filtering and drying. Gelatine was first used in ice cream over forty years ago, when it was observed that desirable physical properties were secured by its incorporation in the mix. Unfortunately, its employment began at the time when most manufacturing processes, especially those of the food industries, were governed largely by stringent traditions. Therefore, as grandfather had not used gelatine in ice cream, the employment of this protein food was shrouded in mystery and concealment. As the ice cream industry emerged from dark cellars and back rooms, where, by the way, it would still be if traditions had been strictly adhered to, a policy of reticence regarding the employment of gelatine remained prevalent among ice cream manufacturers. This is not surprising, because the industry assumed that the value of gelatine in ice cream was solely that of a stabilizing agent and that gelatine had little, if any, effect upon the food value of ice cream.

Gelatine Influences Food Value.

This impression is erroneous, for it has been proved by feeding experiments, conducted during the past year at Mellon Institute of Industrial Research, that the influence of gelatine upon the food value of ice cream is important. These investigational results are of particular significance to ice cream manufacturers, because the continued rapid growth of the industry is dependent largely upon the nutritive value of the product. A delicious and refreshing dessert is a fine article; but the public is becoming more discriminating, and wants to know the dietetic value of foods in daily use.

Having these facts in mind, people are planning dietaries in a systematic manner, according to the newer knowledge of nutrition. For example, Willie likes ice cream, but Willie also is fond of many delicacies; Willie's mother, who knows about the nutritive value and acceptability of various foods, is going to decide the boy's choice. Not only for children is food value a question of importance, but also for every individual

consumer. In the past, the ice cream manufacturer has estimated the food value of ice cream solely on its content of milk solids and sugar and has given gelatine no consideration. In doing this, he has underestimated his product, because gelatine makes ice cream a more nutritious food, one which is easier of digestion and more complete of assimilation. It is obvious that ice cream manufacturers can be benefited by presenting to the public the true food features of their product.

It is important here to consider the chemical and physical behavior of gelatine in the ice cream mix, and to discuss the broad principles involved in the use of gelatine in food products. In the ice cream mix, gelatine increases viscosity, accounting for the formation of very small, evenly-formed air spaces by the beaters during freezing. The texture of the frozen product is dependent upon the uniformity and size of these air spaces. Gelatine, according to one theory, forms a thin film about the small ice crystals produced during freezing and prevents their growth to larger sizes and the consequent formation of grainy ice cream. This is, gelatine stabilizes or protects ice cream; the chemist, therefore terms gelatine a "protective colloid." It has been observed that gelatine in ice cream minimizes super-cooling effects during freezing. Excessive super-cooling results in the formation of large crystals and consequently grainy ice cream. By super-cooling is meant refrigeration in excess of that actually required to congeal the mix.

An Efficient Emulsifying Agent.

While gelatine is the most powerful protective colloid known, it is also an efficient emulsifying agent. The emulsifying action of gelatine can be illustrated by the shaking of a mixture of oil and water. Violent shaking may be resorted to, but the oil and water separate from each other after standing. However, if an emulsifying agent is present, the oil is dispersed through the water in tiny globules and remains as such when shaking ceases. That is, emulsifying agents, such as gelatine, aid in the formation of emulsions by stabilizing them. The properties which make gelatine an efficient stabilizer are the ones which cause it to aid in the digestion and absorption of foods. These properties result from the colloidal character of gelatine and are shown in the emulsifying and stabilizing or protective effects which it produces.

Thus when ice cream or milk without a stabilizer is taken into the stomach the casein is coagulated into more or less dense flocks or curds by the hydrochloric acid and rennin present in the gastric juice and the fats present in the emulsoid state, are carried down, to a large extent, by the casein.

Fats in these casein curds make them tough and leathery and difficult of digestion. Since these masses must be completely dissolved by the juices of the stomach and intestines before the body can absorb the food, large amounts of energy must be expended in the digestive processes. Otherwise much of the food eaten may pass unchanged through the intestines. However, where gelatine is present in ice cream it acts as a protector and renders the casein insensible to quantities of acid and rennin which would otherwise have caused dense curds.

On the other hand, the digestion of ice cream which contains gelatine is strikingly in contrast with the conditions described above. When ice cream containing

ANDERSON "Cut-Wrap" Machine

"It Wraps as it Cuts"

**Simple... Rapid...
Practical... Low Priced**

IN designing and experimenting on the Cut-Wrap idea, it was the desire to perfect a faster machine that would quickly cut ice cream slices wrapped on three sides. Our final accomplishment was greater than this, because while it does this rapidly, yet it as capably cuts quarts and pints; or even slices quarts into sizes suitable for Eskimo Pies. This wrapped idea is a good one for every Ice Cream Manufacturer—large or small.

gelatine passes into the stomach, curdling of the milk casein may be prevented entirely. If coagulation does take place, the flocks are loose and the digestive juices easily dissolve them. Furthermore, gelatine is a peptogenic substance, that is, one which increases the flow of gastric juice. When the food is passed from the stomach into the intestines, the gelatine remaining as such aids the pancreatic juices by keeping the fats in the finely divided emulsified condition.

In the intestines the digestion of food is completed and the nutritive portions pass through the intestinal walls into the blood stream. Gelatine itself is easily digested and its nutritive value also is secured. It is at once apparent, that ice cream containing gelatine is easily digested and readily assimilated. The maximum food value has been secured by the body with a minimum expenditure of energy. Consequently, it is of interest to examine the data secured from the feeding experiments referred to above. It is believed that these data demonstrate that gelatine enhances the nutritive value of many foods, and particularly of dairy products and cereal grains.

The animals used in these experiments were albino rats. They are omnivorous, like humans, and experience has shown that the results of feeding experiments obtained with them are comparable with those observed with human beings. Furthermore, the albino rat lives only about three years and in a comparatively short time the investigator can form conclusions applicable to the life cycle.

In these experiments a litter of young animals were taken shortly after weaning. Half of the litter were placed on a ration containing gelatine, the other half on the same ration without gelatine. The animals were fed daily and were weighed each week. A record of the weight of food consumed was also kept.

These feeding tests have demonstrated that the addition of one per cent of gelatine to milk has increased the nutritive value of milk from twenty to twenty-five per cent. Gelatine has favorably influenced the ability of the animals to reproduce and give milk to their young. The animals whose food contained gelatine were healthy after six months; the animals on milk alone were losing health and vigor.

Increases Nutritive Value.

Also, it is evident that the addition of one per cent of gelatine to a mixture of egg and milk has increased the nutritive value of this food combination. The animals on the food containing gelatine grew at a normal rate on a smaller consumption of food. In addition to this, these animals bore normal young, which in turn grew at a normal rate on the gelatine-milk and egg diet. The animals fed on milk and egg without gelatine consumed a larger amount of food for equivalent gains in weight and they did not raise healthy, normal young.

From these experiments, it is obvious that gelatine has increased the food value of milk and a combination of milk and egg to a remarkable degree.

Indeed, the results were of such significance that experiments were carried out in co-operation with a large hospital in Pittsburgh. In this hospital, one per cent of gelatine was added to the milk formulas upon which certain infants, under one month old, were failing. These babies had been losing weight and vitality from 10 to 14 days after birth, because of their inability to retain their milk food or to digest the little that was retained.

When one per cent of gelatine was added to the babies' milk food, they were able to digest it and regurgitation ceased, dense curds were no longer passed in

the stools, and the infants returned to normal health and growth. It is thus apparent that gelatine rendered the milk food acceptable to infants which were in an exceedingly delicate condition with badly damaged digestive processes.

These findings are of great importance to the ice cream manufacturer, as they demonstrate that the small amount of gelatine in ice cream is decidedly advantageous. There can be no doubt that gelatine in ice cream makes a product acceptable to children, hospital patients and adults with deranged digestion, who would otherwise have difficulty in securing the full nutritive value contained therein.

It should not be assumed that the value of gelatine in the dietary is dependent entirely upon its action as a protective colloid and emulsifying agent. Gelatine is a protein food which supplements the protein deficiencies of many food combinations.

The proteins of many cereal grains do not supply adequate amounts of all the fundamental units (amino acids) which are essential for the normal development of animals. The data shown above demonstrate that gelatine supplies these protein deficiencies in bread and wheat products, rolled oats and pearled barley—cereal grains which are used extensively in the dietary. Gelatine is particularly rich in lysine, an amino acid intimately connected with growth stimulation. For this reason its incorporation in certain food combinations is highly desirable.

Although the ice cream industry annually consumes approximately five million pounds of gelatine in a preponderating percentage of its products, ice cream manufacturers have hesitated in admitting its employment to the public until quite recently. Within the past few months radical changes in the attitude of ice cream manufacturers towards gelatine have taken place. Experimental work by government chemists has shown that three people out of four prefer a gelatine-made ice cream because of palatability. Following these tests, and supplementing them by a judging contest of its own, the Chapin-Sacks Company of Washington, D. C., presented to the public a statement of the facts and stressed the value of the use of gelatine in ice cream. Again, under the guidance of the firm of Barker, Duff and Morris, the Rieck-McJunkin Dairy Company of Pittsburgh, Pa., has given gelatine a prominent part in the advertising of the composition of Rieck's ice cream. The value of gelatine has been stressed from the standpoint of food value.

Manufacturers to Advertise Gelatine's Food Value.

At the recent convention in Cleveland, over 20 ice cream manufacturers signified their intention of advertising the food value of gelatine in ice cream, and since that time requests for further information from manufacturers and advertising agencies, for use in putting over educational campaigns, have been received.

Thus it is seen that the ice cream industry is thoroughly aroused to a due appreciation of the benefits of gelatine in ice cream from the standpoint, not only of body and texture, but also of palatability and food value.

The position of gelatine in the ice cream industry is well established as shown by theoretical deductions, by practical experience, by laboratory experimentation with animals, and by clinical evidence obtained in hospitals. There can be no doubt that the fact that gelatine enhances the food value of ice cream is proving to be one of the most important factors in elevating the position of ice cream among food products.

Overrun Control

Uniform Quality Plays Most Important Part in Building
Up Steady Consumption. Importance of Freezer
Room Not Generally Understood.

By N. M. THOMAS.*

BOUND up in the subject of overrun control are many ramifications of the ice cream business. The control of overrun neither starts nor ends in the freezing room. Overrun is affected by the method of handling your product before it reaches the freezing room, and in turn affects the balance sheet in your office

and the money in the cash register of your customers.

Were I to state which department in an ice cream plant is the most important, and at the same time receives less attention than any other, it is the freezing room. It is surely a truism that "more money is made or lost in the freezing room than in any other single and almost any other combined departments of an ice plant." This being true it should receive the care that it deserves.

N. M. THOMAS.

We see the modern plant equipped with laboratory, if its size justifies it a chemist is employed; the mix previous to freezing is carefully tested for acidity, bacteria, etc. It is in turn standardized for solids, fat and not fat, to at least one per cent and usually even closer than this. Accuracy is the watchword in preparing the mix. Going to the freezing room the supposition is that the same accuracy should be carried out. The reverse is usually the case. When we weigh our finished cans in the hardener we find that while we have standardized our mix to one per cent or less, our finished goods vary from five to

twenty per cent. It is very apparent that this had nullified all our work done in the mixing room. Colors vary, flavors vary, texture varies, body varies in exact proportion to the percentage of overrun that has been drawn.

If our standard at which we aim is 90 per cent for example and part of the day's run has been drawn at 80 and part at 100 we no doubt average 90 per cent at the end of the day. But have we stopped to consider that, if this portion of our goods which has been made at 100 per cent is satisfactory and sufficiently good quality to sell to your trade part of the time, that as a manufacturer you are losing a goodly sum of money by not standardizing all your goods at 100 per cent overrun. A business selling 100,000 gallons per year can increase their profits at least \$10,000.00 by such a method, or in turn can lose even more than this if a large volume of their cream runs below the 90 per cent standard. Where can you so quickly show increased profit on the ledger?

Do not infer from this that I advocate 100 per cent overrun as a correct figure for you to standardize at. My purpose in this is simply to illustrate the point that our freezing room deserves real honest-to-goodness consideration.

YOU appropriate goodly sums each year for advertising. You stress your quality, preach good flavor and texture and yet in one single week you can nullify all this effort and money through putting on the market goods which through careless freezing belie your ads. Advertising very often fails because we do not support it with goods of uniform quality and flavor which leave in the consumer's mind a verification of the truth of our advertising. This in turn affects our retail dealers by keeping from their cash registers a sufficient flow of nickels and dimes to pay our weekly or monthly bills. View from this standpoint overrun takes on a very deserved importance.

The factors which control overrun previous to the freezing room are many and varied. One which seems to me from my experience to be more or less incorrect is the feeling that certain percentages of solids, fat and not fat affect overrun. There is only one point where

they play an important part and that is in the mix of very high total solids. In a mix of this type there seems to be no question, but that it is harder to get a high overrun than in a mix say 35 or 36 per cent total solids. Sugar is a much more important factor in controlling overrun than is milk solids.

These statements seem to be at variance with the generally accepted idea. To illustrate my point in this matter let me cite the fact that you can mix sugar, water and fruit or fruit juice in such proportion that you can secure 150 per cent overrun in a sherbet having little or no milk solids of any kind. This would seem to disprove the idea that overrun is affected by milk solids except in the instance mentioned. High acidity does not have the effect on overrun that a proper ripening either natural or artificial accomplishes. Personally I prefer to ripen artificially rather than over a lengthy holding period. This lessens the chances for the development of high acid condition in the mix and also development of any off flavors which might occur through the use of one or two cans of goods which had a slight off flavor and which as one rotten apple will spoil a barrel, one off flavored can of mix will, if held sufficiently long, contaminate the entire batch.

Too long holding at a temperature of 145 to 150 degrees will affect overrun through hardening of the milk solids. It is well to see that your pasteurizing equipment and your viscolizer are such size that your complete operation can be concluded in one hour. In other words, it is very unwise to use a 100-gallon viscolizer in connection with a 200-gallon pasteurizer. Better the reverse way. It is very reasonable to suppose that in milk work in a city milk plant the cream line in a bottle of milk can be materially affected by overholding a batch of milk for a period of, say, 5 minutes at a temperature of 142 or by overheating to 146 or 147 that it will affect an ice cream mix by overheating and overholding. We are entirely too careless in our heating and pasteurizing of our ice cream mix. It is of sufficient importance to justify a recording thermometer on every ice cream pasteurizer so that you may know at all times what is going on in your mixing room.

Freezer speeds, brine temperature, temperature at which the mix reaches the freezer, are all factors in controlling overrun. No set formula can be adapted to each and every plant. Local conditions and plant operation will largely govern what you must do to control overrun. If you wish a uniform product, if you wish to carry out the standardizing in your mix room and not nullify this work, if you wish uniform colors and flavors, if you wish well satisfied distributors and consumers, if you wish your balance sheet to be a fair subject for an attack by Seey. Mellon, what better place to get all these combined results than to check up your freezing room and control overrun?

MEMBERSHIP DRIVE IN SOUTH DAKOTA.

C. C. Totman, secretary-treasurer of the Ice Cream Manufacturers' Association of South Dakota, has sent out a special letter to manufacturers of his state appealing to them to join the state association. The South Dakota association was organized four years ago. It is doing some very effective work in the interests of the industry in South Dakota, according to developments disclosed at the last two conventions. The association's slogan is "service to its members."

Membership dues are \$4.00 to subscribers to The Ice Cream Review.

PITTSBURGH, PA.

SINCE 1864

TRADE CO-OPERATION IN MARKET DEVELOPMENT.

(Continued from page 12)

trade message to the public and expanding the total common market.

How are we getting on in increasing the sale of our product in comparison with some other goods and service? The nation's wealth in 1910 was one hundred and seventy billions; in 1921 three hundred billions, or an increase of 43 per cent. The present yearly rate of productive wealth in the United States is approximately twelve billion dollars from agricultural sources and twelve billion dollars from manufacturing sources. From this purchasing fund we received for ice cream production in 1923 \$253,295,000.00, or one per cent. You will be interested to note the increase in volume of sales of the ice cream business, compared to a few others as noted below:

Ice Cream (Gallons)	1910	
Candy (Value)	1909	
Cigarettes (Number)	1910	
Coffee (Pounds)	1910	
Automobiles (Number)	1910	
Automobiles (Value)	1910	
— 95,450,000	1922— 263,520,000	Increase 176 %
— \$134,796,000	1919— \$447,726,000	232 %
— 9,000,000,000	1920— 51,000,000,000	466 %
— 933,000,000	1920— 1,290,000,000	38 %
— 187,000	1922— 2,348,982	1156 %
— \$225,000,000	1922— \$2,350,000,000	953 %

Our very unique product—ice cream—is at once a very wholesome food and delicious confection and makes, as do very few articles, a universal appeal to the entire population, so it would seem quite reasonable that

through proper national and local sales co-operation along these new lines, to greatly and rapidly increase the total value. This is obviously a common object everyone connected with the business, directly as manufacturers and dealers in ice cream or indirectly as suppliers of services to the ice cream manufacturer. We may agree and have controversial subjects along many lines but we shall all be of one accord in our desire to see the total volume of the business increased and to contribute our share of money and effort when practical measures are pointed out for its accomplishment.

Co-operation along broad, common lines of market development offers the opportunity to secure the greatest possible sales effect per dollar spent and to very greatly reduce the waste and inefficiency of present methods.

THIS plan contemplates, through proper organization, co-operative advertising by local manufacturers in each city and many other lines of joint promotion, which this initial step will logically lead up, such as featuring demonstrations, talks over the radio and before churches and other organizations, presenting to dealers better promotion methods, etc. All of these common activities by local manufacturers has the very distinct advantage in addition of promoting friendly personal and trade relations along sane and legitimate lines in which the creative selling impulse finds a favorable atmosphere for original planning and vigorous initiation.

The ice cream manufacturers of Grand Rapids have pooled their advertising appropriation for this year in line with this newer and better method and samples of these first advertisements in the local papers are given herewith. In addition they are planning to give the papers educational publicity about our business and our product which will run free in the news columns. The Detroit manufacturers are considering the plan and have started off by arranging for a monthly radio program for which they will supply songs, music, etc., interspersing with a few short, snappy educational talks. It is hoped that in the near future these plans will spread throughout Michigan, and be a step toward their general adoption in the country at large.

Nationally through the proper organization the same effective lines of work can be carried on in the way of national advertising and truthful, educational, free publicity. Competent sales promoters, representatives of the central organization, should be traveling the country over to study the best sales and advertising methods and broadcast them to the trade through special publications in the trade papers, as well as by addresses before national associations, state associations and local meetings of manufacturers.

I have suggested these few lines of co-operative massed sales and advertising effort but there are many other refinements possible which would follow along in the logical development of the plan.

In the selling field during the last twenty years refinement and complexity of sales and advertising effort have been going on. The emphasis has been very largely on the competitive side to secure the other fellow's business and the business of natural growth so that the general result has not been increased efficiency but often on the contrary, decreased efficiency measured in terms of percentage of sales cost to the value of goods sold. Improvement in net selling efficiency as thus defined has not been found along previous lines and never will be. It lies in our waking up to the necessity, importance and essential efficiency of getting over the broad educational trade message of the advantages of our product, through

Illustration shows an eight hole Frigidaire Cabinet installed
in the Fairview Pharmacy, Dayton, Ohio

A Paying Investment

The Frigidaire Ice Cream Cabinet has been designed to *save money* for manufacturers and retailers of ice cream.

It renders money-saving service wherever it is installed—freedom from the use of ice and salt, freedom from *repacking*. Eliminates *shrinkage*. In this way, in the average small store, the Frigidaire Ice Cream Cabinet pays for itself in less than a year.

The Frigidaire Ice Cream Cabinet represents the result of over eight years' experience in the refrigerating field, and a National Service Organization assures prompt and capable service at all times.

Made in four, six and eight hole sizes.

Leffel Scotch Marine Boiler

EASY cleaning and firing facilities are among the reasons why Leffel Self-Contained, Internally Fired, Horizontal Return Tubular, Portable Boilers are so desirable for use in Ice Cream Factories, Creameries and Dairies. The above illustration shows the accessibility of tubes, fire box and water chambers.

They come on skids complete with all necessary fittings. Made in 12 sizes—6 to 100 H.P.—each size more powerful than other boilers of the same size. They are quick, steady steamers, decidedly economical to operate, and meet requirements of all State boiler laws.

massed, co-operative attack, freed from this endless competitive duplication by every manufacturer in telling the message single handed.

WHEN an entire trade organizes to promote and advertise its goods and services, to issue educational publicity, etc., the public accepts the effort as the dignified and truthful expression of a great business and takes it at very near 100 per cent of face value. On the other hand when a single manufacturer makes a similar effort the public realizes that he is at least saying all that is to be said along the narrow competitive lines of a particular product and company, and accordingly discounts it generously.

The writer in 1903 began the agitation and started an educational campaign in the electrical business along these general lines which culminated after ten years in 1913, in the establishment of the society for electrical development which has been actively at work for over ten years in prosecuting a comprehensive sales promotion campaign, both nationally and locally. You doubtless are familiar with its slogan, "Do It Electrically." The results of its work have been so great that the entire plan is now accepted by the electrical business as advanced, forward looking, trade policy in market development. Its scale of operation may be inferred from the size of its salaried staff of forty people in its varied line of activity at the home office and in the field.

The plan and work of the society has been the subject of investigation by other lines of trade, one of which the Paper Makers' Association, says of it as follows in a recent publication:

"Preceding any detailed description of the work of the society, it will be interesting to note what has happened in the electrical industry since 1913. The astonishing growth in the use of electricity during the last ten years cannot, of course, all be attributed to The Society for Electrical Development. But it is admitted by the leading men in the industry that the society has been one of the most important factors in doubling and trebling the consumption of electricity.

From 1913 to 1922 the number of kilowatt-hours consumed increased from 14,175,554,940 to 47,659,004,000 or more than three times. The number of homes wired for electricity increased during this ten-year period from 2,500,000, to between 8,000,000 and 9,000,000, or more than three times. And the number of electrical appliances sold during this time increased from a few hundred thousand to 25,000,000.

To bring figures still further up to date, we quote from the Electrical World: During the first six months of 1923 the electric lighting companies sold a total of 32,480,000,000 kilowatt-hours of electrical energy, which shows a gain of 25.4 per cent over the amount of energy sold during the first six months of 1922. "If this increase is maintained at the same rate during the second half of 1923," the World continues, "the figures will be astonishing. To double the operations of an already large industry inside of four years is a stupendous undertaking."

I have quoted enough of their comment to convince you, I trust, that this plan has passed through the theoretical stage and has now back of it over ten years of practical accomplishment which fully proves the extraordinary degree of efficiency that is claimed.

THE writer has a substantial material interest in the ice cream business as a director and officer in the Arctic Ice Cream Company of Detroit, The Telling-Belle Vernon Company of Cleveland and some other companies, in addition to which he is interested as president

Universal Homogenizer

The Mark of Merit

Built to Keep Upkeep Down

The universal embodies all the advantages of old time machines in addition to many much needed improvements.

So constructed that it will stand up under severest of tests day in and day out—year in and year out—without adjustments or replacement of parts.

Individual cylinders machined from rolled Tobin bronze bars (not cast).

High pressure manifold machined from rolled Tobin bronze having tensile strength of 55,000 pounds.

Individual shimming of cross-head slides maintains correct individual alignment of pistons at all times.

Chrome vanadium steel shafts.

Monel metal pistons not affected by milk acids.

Homogenizing valve—internal spring type—plug and seat are made of an alloy of semi-precious metals so hard it cannot be machined but must be ground with carborundum.

Built in belt or motor drive sizes 200, 400 and 800 gallons.

SALES BRANCHES EVERYWHERE

CP Horizontal Refrigerating Machine

of the Nizer Laboratory Company in scientific development of new apparatus of which the Nizer electric cabinet is at the moment the outstanding accomplishment. These connections are mentioned so that if it might seem appropriate they would constitute sufficient justification for addressing the ice cream trade at large on this plan. The writer will be glad to place his rather unusual experience along the lines of The Ice Cream Review at the disposal of the ice cream industry through the proper officers or committee of the association, and to assist as far as possible in introducing this more modern and efficient method of creative co-operative market development.

Roosevelt said, very rightly, "Every man owes it to his profession or trade to make some contribution of time and thought along broad lines for its progress." I hope I may be able to make some contribution in this one important branch which I feel certain will result in not only material gain through increased volume but by bringing a secondary and perhaps larger advantage, since the very nature of the efforts to accomplish it develops a more friendly personal and trade atmosphere so favorable and necessary to constructive thinking and action along all progressive lines.

NEW WAYS OF ADVERTISING ICE CREAM.

(Continued from page 8)

zation holds regularly, you should demonstrate the proper way to decorate a window and the plant carpenter can easily make a dummy window for you to carry on your demonstration work. Plan out two or three simple window trims that can be completed in

five minutes time and show how they are done. If you get the window trims simple and good looking, the salesman will be interested in how you do it, and will readily put in such display themselves. Use some good window display signs, and with the addition of a few cones and cartons, a very good effect can be obtained. Never attempt to use window display material which is too large or too bulky. No salesman can be expected to carry it and no dealer wants it in his window.

As often as possible have the salesmen deliver or place the advertising material themselves. In this way they have an opportunity to check up on the service, the quality of the cream, and to nip in the bud any criticism the dealer may have to offer. If the dealer's windows are already decorated, they can at least place a few signs on his back bar or counter, and at a later date decorate his windows. The dealer, first and last, likes to be catered to. If the salesman is a wise man he will cater to his dealers in every possible way. It is merely a matter of making the salesman secure the maximum service from the advertising material. In many of the larger organizations the work of distributing advertising material is being made a definite part of each salesman's work, and he is not asked if he will distribute it, but is told to distribute it. As the tendency for co-operation grows in favor among the various ice cream manufacturers, the different sales departments can be expected to co-operate far more than they have ever done in the past.

In conclusion, there is one sentence which every advertising man should accept as his slogan, "Make your advertising display material so good that it will sell itself." Use discriminating care in your selection of the proper type of advertising material and your sales organization will place it for you.

KENTUCKIANS DISCUSS CO-OPERATIVE ADVERTISING AND NEW ICE CREAM LAW.

Taxation, co-operative advertising and Kentucky's new ice cream law were topics discussed at a cold meeting of the ice cream division of the Dairy Products Association of Kentucky at Louisville, April 16. Several of the principal ice cream manufacturers of the state attended.

An important meeting covering the new ice cream law and its enforcement followed luncheon at the Brown Hotel. The following announcement was issued by Carlton Ball, general secretary of the association, following the meeting:

"The new law, which provides for a minimum of ten per cent butterfat and thirty-four per cent total solids, is complete in its scope for the protection of the consumer, the upright dealer and the legitimate manufacturer, and carries with it a penalty of ten to a hundred dollars fine or imprisonment not to exceed fifty days, or both so fined and imprisoned for each offense.

"It is first planned to acquaint every ice cream manufacturer and every ice cream dealer in the state with the law and its benefits for upbuilding the industry, and to enlist their respect and seek their co-operation, after educational means have been exhausted, in bringing violators to face with the reality of the law.

"Kentucky has a tax law exempting machinery for manufacturing purposes from city and county taxation. Some cities recognize this law for ice cream machinery while others overlook the fact. A friendly suit will be brought by the ice cream manufacturers of Lexington to definitely determine the status of their machinery.

"The \$1000.00 For A Slogan Campaign which has been inaugurated by the National Association of Ice Cream Manufacturers was heartily approved and preparations will be made to lend the proper co-operation by all the manufacturers present, to make the campaign a success.

"Arrangements will also be made to feature the National Cone Week which begins the week of June 9, the manufacturers co-operatively making such a program as will be best suited for the conditions in each city."

Automatic Refrigeration

REFRIGO for the Ice Cream Cabinet

HIGH SPOTS

Fits any cabinet
Completely automatic
Capacity, equals 200 pounds ice per day
Operated by $\frac{1}{4}$ H. P. motor
Installed beside cabinet, or in basement
Ammonia; Sanitary; Economical
Saves 9 to 16 cents per gallon
Maintains uniform temperature
Eliminates salt and ice
Soon pays for itself
Patented leak-proof seal
Cost of operation nominal
An investment, not an expense

The Last Word

REFRIGO is the last word in the refrigeration of ice cream cabinets. It refrigerates as dependably as the large commercial ammonia machines, but is without their size or expense.

REFRIGO is the machine every ice cream manufacturer and dealer needs. It saves him big money.

Supply Association Co-operating in New Orleans' Plans

Entertainment Schedule for Members of National Association of Ice Cream Manufacturers Prepared by the Supplymen's Association

ANNOUNCEMENT from The Association of Ice Cream Supply Men of arrangements it is making in connection with New Orleans, indicates that Ice Cream Manufacturers and the supply men, are at work to make the former's convention in November an outstanding success.

The Association of Ice Cream Supply Men, chiefly because of unfavorable physical facilities for a large scale, national show, decided recently that an exposition could not be held in 1924. It has already begun the carrying out of plans for national activity in the interest of the convention, announcement now reveals, with the approval of the National Association of Ice Cream Manufacturers.

Conferences of representatives of the two organizations have resulted in the formulation of an entertainment schedule for the national association's New Orleans week, extending from Sunday, November 16, when some national association members will arrive in the southern city, through Thursday, November 20, the day convention sessions close. In this schedule the Dixie Flyers, the organization of supply salesmen, travelers or resident in the South, will co-operate with The Association of Ice Cream Supply Men.

This program of entertainment will be under the general direction of, and in large part provided by, The

Association of Ice Cream Supply Men as an official part of the convention events, just as the supply organization provided and assumed direction of the entertainment events in connection with the 1922 and 1923 conventions of the national association in Cleveland.

ON Saturday, November 22, as already announced by the national association, its special Havan Canal Zone 17 day boat trip will start from New Orleans. This, of course, is under the control and auspices of the national association itself, and adds a unique entertainment possibility to the whole affair.

Indications, according to observers, pointing to an exceptional attendance of ladies at New Orleans, the supplymen are making unusual arrangements for the comfort and convenience which, when worked out, the association's announcement promises, will be found to have taken into primary consideration individual and small group rather than large group freedom and enjoyment for those entertained.

"Association members and the members of the affiliated salesmen's club share with many of the country ice cream manufacturers a logical enthusiasm for the New Orleans plans," a statement issued from the association's offices recently said. "They will be found saying so in many an office and to many a customer acquaintance."

An Improvement Found In Solar Cans Only —Solar Triple-Folded Top Bands

Clean, smooth, rounded edges that cannot become ragged or out of shape are the distinctive features of the tops of Solar Ice Cream Cans—both "Ultra" and "Tin-Okeh." These tops cannot open up or spread—they cannot cut the hands of your workmen. They will not crack and will not admit dirt or cream to sour and contaminate. And Solar can covers always fit.

SOLAR

ICE CREAM CANS

The Triple-Folded Top Bands on Solar Ice Cream Cans "stay put" for life, because they are part of the cylinder. By a patented process of manufacture they are made to hug the top of the can under enormous pressure. This process binds the top of the can tightly, keeps its shape and makes a thicker, heavier, stronger top than the old style separate hoop.

Such care in every detail of manufacture makes "Ultra" and "Tin-Okeh" the longest wearing, most economical cans you can buy. Write us today for prices and full description.

NOTES OF THE TRADE

News of Interest Concerning What Our Readers and Advertisers are Doing to Develop the Industry. We Invite Correspondence Relative to New Products and New Equipment.

ANDERSON "CUT-WRAP" MACHINE.

The Anderson "Cut-Wrap" machine is described by its makers, the Anderson Bros. Manufacturing Co., Rockford, Ill., as a machine that wraps and cuts at one operation. It is claimed to be simple, rapid, practical and low-priced. In a bulletin explaining the nature of the machine, the company states that an eight-quart brick slab is quickly cut-wrapped

into any desired number of slices, as it "cut-wraps" two slices at one time. These prices can be slit for individual bricks or slit into quarts and placed in cartons. Wrapped individual slices have a good market at schools, theaters, outings, baseball games, etc., the company points out. Officials say "cut-wrap" quarts make an ideal and quicker way to serve large gatherings such as churches, lodges, socials, etc.

* * *

SWEET CREAM BUTTERMILK POWDER.

"Lacalac" is the trade name of a dehydrated pasteurized sweet cream buttermilk powder manufactured by The Dry Buttermilk Company of Waseca, Minn. The product is described as sweet butter milk with the water taken out, nothing added. It is said to require no ice, to entail no waste, give no worry, and is convenient and economical.

E. W. Ward of the Dry Buttermilk Co., advises The Ice Cream Review that his company is going into creameries making only sweet cream butter, and hopes to have at least ten plants equipped with butter milk driers by September 1. Mr. Ward points out that as the product is made from the milk churned from sweet cream it is sweet and palatable, and that it has a much larger butterfat content than sweet skim milk.

The company is incorporated for \$100,000. R. P. Ward is president, and E. T. Wishop is vice-president. Plants recently were installed at Dover, Fergus Falls and Leican Rapids, in Wisconsin. The company has operated at Dodge City, Wis., for some time.

* * *

HUGHES GELATINE CO. IN NEW HOME.

Steady growth of the business of the "House of Personal Gelatine Service" has compelled the Hughes Gelatine Co., Detroit, Michigan, to move from 143 Griswold St., into new and spacious quarters at 1815 Franklin St., according to recent announcement. The company reports splendid prospects for the year 1924.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

NEW DIAL THERMOMETER.

What is termed "a radical departure in thermometer construction," is announced by the Moto Meter Co., Inc., Long Island City, N. Y. The new instrument, which takes the name of Motoco Industrial Thermometer, is of the dial type and

therefore holds out all the advantages of easy reading offered by indicating thermometers of that class. The dial is said to be of the standard annometer form, with large, legible numerals, for which the makers claim readability at an average distance of 20 feet.

For installations in dark or inaccessible places, 10 feet of tubing is furnished as part of the regular equipment. By inserting the bulb at the point where it is desired to take the temperature, the head may be mounted in the light on the wall, instrument board or elsewhere, and it is claimed that this facilitates temperature readings.

It is possible to lead the tubing from the factory or work-room through partitions to the superintendent's office or to points farther than 10 feet distance by ordering an extra length of tubing. The flexible construction of the bracket is said to allow for mounting on horizontal or vertical surfaces, while the swing of the thermometer on the bracket covers an arc of 90 degrees, sufficient to incline the dial so that it comes within the range of vision from any convenient position, company officials say.

* * *

TO EMBARK FOR EUROPE.

Announcement has been made by the Blanke-Baer Extract & Preserving Company, St. Louis, that the company's president, Dr. Baer, and Mrs. Baer expect to embark on June 7 for a three months' trip abroad. Dr. Baer will call on the distributors of Blanke-Baer products located in London, Liverpool, Glasgow, Paris, Copenhagen, and Christiania, and also will arrange for distributors in Holland, Belgium, Switzerland and Italy, it is announced. The company claims that Blanke-Baer Pineapple cubes have met with great favor in England and continental Europe, and on this item officials expect their export business to more than double this year. They report that their extracts have slowly but surely been making headway in Europe.

Back Up Your Flavor Specials With "Taste Appeal" Advertising

Put A Real Merchandising Idea Behind Your Product This Season, Mr. Sales Manager

CUT out costly experiments. Get down to brass tacks. *Back* your sales force and dealers with the *identical selling idea* that "big time" manufacturers all over America are *using every day in the year*. THE WEEKLY FLAVOR SPECIAL has proven to be, beyond all doubt, the *biggest, the best, the hardest hitting gallonage producer* the Ice Cream trade has ever known. And our Beautiful Flavor Strips are to the "Special Flavor" what gas is to your car; what honey is to the bee; what salt is to food. They put the "Special Flavor" across and keep it put.

They never fail, which is something that can't be said about any other form of Ice Cream Advertising.

American Ice Cream producers spend thousands yearly for expensive Cutouts, Calendars, and other "good will" advertising. Yet you can't honestly prove that one single dipper of Ice Cream was ever sold through these mediums.

On the other hand FLAVOR STREAMERS will never lie idle in your stockroom. They are "Selling Advertising." The kind of advertising that you can actually "see" gets results from the first day used.

Your salesmen welcome them, Dealers ask for them. The consumer constantly watches for the special story they tell. And the big point is the consumer buys, when, and WHERE Flavor Streamers tell their story. Your request on firm's stationery speedily brings all information.

A New Practical Standard for Ice Cream Manufacturers

NAFIS Standard Ice Cream Color Rods

will help you maintain uniform colors of your ice cream. One color rod for each of the three popular flavors:—Vanilla (including egg ice cream), Strawberry and Chocolate, each rod containing four shades to suit various tastes.

Order a set of three today from your jobbers. If they do not stock NAFIS GLASSWARE, write for our circular on NAFIS ICE CREAM COLOR RODS and the names of our distributors in your territory.

LOUIS F. NAFIS, Inc.

Manufacturers of Scientific Glassware for Testing Milk and Its Products

17-23 N. Desplaines St., Chicago, Ill.

NAFIS ICE CREAM COLOR RODS.

Louis F. Nafis, Inc., of Chicago, manufacturers of scientific glass apparatus for testing milk and its products, now have ready for the market another of their patented color comparison rods—this time the Nafis standard ice cream color rod, being somewhat similar to the Nafis standard butter color rod. Each glass rod contains four shades of color for a flavor and they are now furnished for the three most popular flavors: Vanilla (including egg ice cream), strawberry and chocolate, the three rods making a set.

The Nafis company has spent considerable time, money and effort to obtain just the correct colors and the shade they finally adopted represent the consensus of opinion as they have obtained it from numerous ice cream manufacturers and dairy school professors in various parts of the country, officials say. These color rods, they declare are put out in response to constant requests for such a standard from various ice cream associations and companies in United States and Canada. Officials believe they will prove of practical and educational value. They can be used for standardizing the colors of ice cream mix during the process of manufacture as well as for judging finished ice cream, it is claimed.

WAR VETERAN IS SALES SUPERVISOR.

ALLYN G. WHITEHEAD.

Allyn G. Whitehead is the general supervisor of sales, Eastern district for The Purity Paper Vessels Co. of Baltimore Md., well-known manufacturers of Purity Paper Cans and Pavesco Paper Milk Bottles. Mr. Whitehead became associated with The Purity Paper Vessels Co. shortly after he was discharged from the army where he served overseas with the famous Squadron "A" of New York. Previous to the time of his appointment to the position of sales supervisor, Mr. Whitehead was a special representative and called on most of the ice cream manufacturers throughout the United States; the company's product being distributed nationally.

SOMETHING EVERY RADIO FAN SHOULD HAVE.

We are glad to bring to the attention of radio fans a new book which should be a desirable acquisition to every operator or prospective operator.

Henley's 222 Radio Circuit Design is the title of the book. It is a comprehensive and up-to-date collection of modern receiving and transmitting circuits with complete design data showing the electrical values of inductances, capacities and resistances. The name of each element is on the diagram of the circuit. Each circuit has actually been tested and can be successfully built and operated when directions are followed.

This book of nearly 300 pages and showing hundreds of illustrations can be secured from The Olsen Publishing Co., Milwaukee, Wis., for only \$1.00.

Orders will be executed on receipt of remittance and book will be sent postage paid.

ESKIMO PIES IN ARGENTINE.

Announcement has been made by the Eskimo Pie Corporation of arrangements for the manufacture, distribution and sale of Eskimo Pies in Buenos Aires, Argentine, South America. Saint Hermanos of Buenos Aires are the representatives there.

The Eskimo Pie Corporation also announces that Eskimo pies are now being made and sold in Mexico, Cuba, Canada.

ESKIMO PIES

If you are making 5 cent Pies you need a Thin Flowing Chocolate Coating. —USE

Fortune's "Thinflo"

"THINFLO" produces a thin shell-like covering, has a delicious flavor, comes all ready for use (no additional butter required) and is most economical because of the great number of pies covered.

"THINFLO" was used on the Anderson Eskimo Pie machine at the Cleveland Convention.

ELYRIA GETS MANY REPLIES FROM AD IN REVIEW.

The Elyria Enamelled Products Company announced its "300 Special" in its advertisement in The Ice Cream Review in February. Since that time, officials of the company say, the sales of this unit have far exceeded their hopes. They recommend the "300 Special" to our readers and suggest that manufacturers write the Elyria company at Elyria, O., for one of their new folders just issued on this unit. This folder describes the unit in detail and gives prices and complete data.

The line of pumps handled by Lammert & Mann Co., 215 North Wood St., Chicago, is described in a pamphlet recently issued, copy of which has been received by The Ice Cream Review. The pamphlet gives interesting information concerning Lammert dry vacuum and pressure pumps, which are said to be used extensively in dairy plants, chemical laboratories and for many varied special purposes where hard dry vacuum is required. With automatic control they are adapted to the priming of centrifugal pumps, it is claimed. Lammert pressure pumps are said to be used for spraying, positive blowing for machine shops and any other service where pressure up to 25 pounds can be used. The pamphlet says that Lammert pumps may be procured for any type of power drive, such as common pulley, tight and loose pulley, clutch, motor equipped, etc.

The James F. Drew Co., importers of gelatine and egg yolks, has changed its location from 382 Pearl St. to 320 Broadway, New York City. Correspondents have been asked to note the new address, and change records accordingly.

A new wooden spoon for use by ice cream manufacturers in packaging with bricks and other cartons to go to the retail trade has been designed by L. F. Grammes & Sons, Inc., Allentown, Pa. One of the advantages this company claims for its spoon is the smooth edge, and it is claimed that each and every spoon is a perfectly formed and cut product made of clean, white wood and packed in clean containers.

The Daisy fly killer offered to the dairy industry by Harold Sommers of 150 DeKalb Ave., Brooklyn, N. Y., is going to be a great help in eliminating the fly pest, according to Mr. Sommers. The fly killer is supplied in a container made of metal and cannot spill or tip over. It is claimed that it does not soil or injure anything it may be placed upon, but on the contrary is ornamental looking. Ice cream manufacturers will be interested in investigating the merits of this method of eliminating the fly, Mr. Sommers believes.

A. L. Sherman of New York recently announced his association with B. W. Burckhalter and will continue business under the name of Sherman & Company with headquarters at 100 Hudson Street, New York City. Mr. Sherman will continue to devote his time to pasteurized sweet cream and sweet barrelled condensed and evaporated milk. Mr. Burckhalter formerly was associated with the Golden State Sales Corporation, originally the California Central Creameries, and will specialize in the sale of butter, milk, fat, casein, powdered and whole milk. They will act as the direct factory representatives for the exclusive sale of milk products. The consolidation became effective on March 1, 1924.

The C. J. Tagliabue Mfg. Co., Brooklyn, N. Y. has added to its instrument line, a combined recorder-controller. In this design an air-operated temperature controller mechanism and a recording thermometer are mounted in the same case and are actuated by the same thermostatic system, according to officials of the company, who add that all the "structural features" of the Tag recorder such as the uniformly graduated chart, non-corrodible inverted fountain pen, pen pressure and position adjustment, improved chart holder are incorporated in this design. An important improvement is said to be the entire elimination of the rubber connections usually employed in instruments of the combined form.

Officials of the company believe that every manufacturer of ice cream who is contemplating the purchase of new equip-

The Measure of Value

Quality and service are so related to cost that results alone can determine economy.

For this reason the uniform and dependable quality and the unfailing service which accompanies the use of

Wyandotte
Dairyman's
Cleaner and Cleanser

is deciding the steadily increasing demand by ice cream manufacturers for this unusual product.

They know that wholesome, odorless, sweet and sanitary equipment throughout the ice cream plant largely determines the quality of the finished product.

They know too, by experience, that these desirable results are more quickly, easily and harmlessly obtained by Wyandotte Sanitary Cleaner and Cleanser.

Moreover their experience proves also that this cleaner is unusually economical.

ment should by all means be in possession of the beautiful new catalog No. 2063, just issued by the J. G. Cherry Co., Cedar Rapids, Ia., describing its complete line of freezers. The catalog gives full details of the construction of the 100-quart, 80-quart, 60-quart, 50-quart and 40-quart machines, and is profusely illustrated. The catalog also contains pictures of many of the recent large installations of Cherry freezers.

* * *

J. H. Hart of Patchogue, Long Island, New York, announces having just completed an addition to his plant, that of the Hart Waterproof Clothing Company. This company has enjoyed an increase in business which made it necessary to expand the capacity of their plant, officials say. They are making the well known Hart six-in-one waterproof aprons and other waterproof clothing which is sold by virtually all leading jobbers of dairy supplies.

* * *

Announcement has been made by J. Noodleman, president of the newly formed Houston Cooperage & Tub Co., Houston, Tex., that this company now is erecting a new

building for its home and will install machinery for the construction of all kinds of wood barrels, kegs, and ice cream tubs, making the well-known patented double-bottom ice cream tub, which is said to be guaranteed for a period of three years against the bottom coming out.

The company expects to be in operation in May. Machinery for the manufacture of barrels and kegs will be in operation at that time, but it is expected that the machinery for tub manufacture will not be installed until some time later.

* * *

The Elyria Enameled Products Co., Elyria, Ohio, announce the addition of L. H. Evers to its sales force. Mr. Evers will represent this concern in the Southern territory with headquarters at Birmingham, Ala.

* * *

The Century Electric Company has changed their office address from Century Electric Company, 56 West Randolph St., Chicago, to Rooms 1931-3, 160 N. La Salle St., Chicago, Ill. This change will enable the company to give better service to its customers, officials say.

Texas Ice Cream Manufacturer Goes a-Hunting

W. H. Irvin, Houston Ice Cream Manufacturer; Sheriff T. A. Binford, and the three deer they killed between convention trains.

W. H. Irvin, Houston ice cream manufacturer, is the envy of friends in his town. The accompanying photo shows three deer that were killed by Mr. Irvin and others who went out on a little hunting expedition in the interval between the Texas convention and the Southern convention. Some Texas ice cream manufacturers went on from the convention at Galveston last fall to the

Southern convention at Little Rock in December. During this time, Mr. Irvin, accompanied by T. A. Binford, sheriff, visited the King Ranch near Kingsville, Texas, in pursuit of deer. The three deer were carried to Houston and displayed to the delegates who returned from the Southern convention.

New Constitution and By-Laws Adopted by the Ohio Association

WHEN the matter of revising the constitution and by-laws was brought up at the past convention of the Ohio Association of Ice Cream Manufacturers it was voted to incorporate and adopt constitution and by-laws submitted with but few changes. They are as follows:

These Articles of Incorporation of the Ohio Association of Ice Cream Manufacturers.

WITNESSETH, That we, the undersigned, all of whom are citizens of the state of Ohio, desiring to form a corporation, not for profit, under the general corporation laws of said state, do hereby certify:

FIRST, The name of said corporation shall be The Ohio Association of Ice Cream Manufacturers.

SECOND, Said corporation is to be located at Columbus in Franklin county, Ohio, and its principal business there transacted.

THIRD, Said corporation is formed for the purpose of collecting and recording substantial information relating to the ice cream trade; adjusting and settling, in proper and equitable manner, controversies, disputes and differences as to contracts, accounts and other disputes that may arise; guarding, protecting and promoting the general interests of the ice cream trade in Ohio; the collection and distribution, without charge, of scientific data relating to the manufacture of ice cream, to increase and promote a general spirit of usefulness of the industry to the public, and doing all of the things necessary and incident thereto.

To acquire property either by purchase or lease for the building of the association headquarters.

Regulations and By-Laws.

Article I

Officers

The officers of this association shall be a president, a vice-president, a secretary who shall be designated as executive secretary, a treasurer and a board of trustees.

Article II

Membership

Sec. 1. Any manufacturer of ice cream or manager of a department of an ice cream factory, or an officer of any company manufacturing ice cream, if such manufacturing concern shall be doing business in Ohio, may become a member of this association upon recommendation of any member of this association, subject to the approval of a majority of the board of trustees and the payment to the secretary of the annual membership fee as may be determined by the board of trustees.

Any member or representative of a firm engaged in the manufacture of ice cream or supply equipment business may become an associate member of this association without voting power by paying associated membership dues as may be provided by the board of trustees.

Any member or employee of a firm which holds a regular membership in this association may become an associate member without voting power, by paying the associate membership dues.

Sec. 2. Any member of this association who may violate any of the provisions of these articles and by-laws, or who may violate any code of ethics now in force or hereafter adopted, or who may permit his dues to the association to fall into arrears may forfeit his membership in the association by an affirmative vote of three-fourths of the membership of the board of trustees.

Article III

Sec. 1. There shall be no capital stock in this association and no dividends shall be declared to members hereof. No profit is contemplated and none shall be earned.

Sec. 2. The monies and income of this association shall be appropriated by the board of trustees to carry out the objects of this association and to promote social and business interests of those engaged in the ice cream business.

Article IV

Affiliation With Allied Associations.

Sec. 1. This association may become affiliated with any allied dairy association upon the affirmative vote of a majority of the board of trustees and the officers of the association shall, by virtue of their office, be delegated to represent the association in such allied association, with power to vote the wishes of this association in the conduct of the affairs of said allied association.

Article V

These articles of association may be amended or changed by a two-thirds vote of the members in good standing at any regular meeting of the association, or at any special meeting called for that purpose upon fourteen days written notice to members. Said notice shall state the purpose of the meeting and give an explanation of the reasons for the proposed changes.

Article VI

Districts

The board of trustees shall have the power to divide the state into—geographical districts and designate the number of each said districts for the purpose hereinbefore set out.

BY-LAWS.

Article I

Meetings

Sec. 1. Annual meetings of this association shall be held on the last Thursday in January of each year, or upon such day as may be designated by the board of trustees.

Sec. 2. Auxiliary meetings of this association shall be held at the call of the president or as may be decided upon by the board of trustees. The president shall call a meeting at any time upon the written request of ten members.

Sec. 3. Meetings of the board of trustees shall be held quarterly and at the call of the president and at such other times as the members thereof may specify.

Sec. 4. Delegates shall vote in person; no voting by proxy shall be allowed.

All votes shall be by viva voce, except on elections, which shall be by ballot, and nominations shall be made from the

floor. In all viva voce votes any delegate may demand a division of the house.

Sec. 5. Notices of all association meetings shall be issued by the executive secretary and mailed to the address of each member at least seven days prior to the date of the meeting.

Article II

Quorum

Sec. 1. At any meeting of this association 25 per cent of all members in good standing shall constitute a quorum, but a lesser number may adjourn from time to time.

Sec. 2. A majority of the members of the board of trustees shall constitute a quorum for the transaction of business.

Article III

Election of Officers

Sec. 1. The president and vice-president and treasurer of this association shall be elected by the board of trustees at the first meeting of the board following the annual meeting of the association each year.

No president or vice-president who is elected to office shall succeed himself.

Sec. 2. The board of trustees of this association shall be composed of one member from each geographical district to be elected by the members of said district; which said districts shall be numerically designated. At the first election the districts represented by the odd numbers shall elect their trustee for a period of one year, the districts represented by even numbers shall elect their trustee for a period of two years, upon the adoption of these articles and by-laws. Upon the expiration of the terms of all trustees their successors shall be elected for terms of two years each, the purpose being to have but one-half of the trustees retire each year, and the remaining one-half to serve during the next ensuing year.

Article IV

Voting

Each member in good standing of this association shall be entitled to one vote on any question that may come before any business meeting.

Article V

Duties of Officers

Sec. 1. The duties of the president shall be to preside over all meetings and to perform such other duties as are usually required of such officer.

Sec. 2. The duties of the vice-president shall be to perform the duties of the president during the absence of the president.

Sec. 3. The duties of the executive secretary shall be to keep an accurate record of all proceedings of the meetings of this association; to keep an accurate account of all monies received and expended; to certify to the treasurer for payment all accounts which have been authorized by the association or by the board of trustees; to transfer all monies of the association received by him to the treasurer; to attend to all correspondence of the association; to furnish an accurate statement of the financial condition of the association at its annual meeting and to the board of trustees at any time that the board may request it and upon seven days notice; to meet with the board of trustees at their meeting, although he is not to have a vote in any meeting and to do all those things and perform all those duties which are reasonable and which the association may ask of him.

Sec. 4. The duties of the treasurer shall be to receive and keep all funds of the association that may be turned over to him and to pay out such monies as may be directed by the board of trustees of the association, and to pay such accounts as may be certified to him for payment by the secretary. The treasurer shall at all times be under a \$2,000 bond, the premium for which shall be paid from the funds of the association.

Sec. 5. The board of trustees shall constitute the managing and governing body to carry out the objects of the association, always seeking council and advice from competent attorneys when matters of a legal nature are involved, and they shall use the moneys of the association for these purposes.

The management and control of the affairs of the business of this association shall be conducted by the board of trustees and correct and accurate minutes shall be kept of the proceedings.

The board of trustees shall be authorized to employ an executive secretary, who shall be charged with the duty of

Officers and Committee Expenses.

Section 1. All expenses of the officers and board of trustees for special meetings held in the interest of the association, after being approved by the president, shall be paid by the treasurer, out of association funds.

Sec. 2. All expenses of any regularly constituted committee serving in the interest of the association, after being approved by the president, shall be paid by the treasurer out of association funds.

Article VIII.

The state of Ohio shall be divided into.....districts. Each district shall be composed of the members of the association resident in that district, and each member thereof

shall also be a member of the district organization, with one vote in the district meeting. Each district shall elect a chairman and vice-chairman, and said chairman shall, by virtue of his office, be a member of the board of trustees of the association.

Article IX.

Order of Business.

In the conduct of any meeting of this association or any district meeting of this association, or of the board of trustees of this association, the provisions of Roberts' Rules of Order shall be followed.

Article X.

Section 1. These by-laws may be amended or changed by a majority vote of the members at any annual meeting or any meeting called for that purpose, upon written notice to the members. Or amendments to the by-laws may be made with the assent in writing of two-thirds of the members.

APRIL MEETING OF NEW ENGLAND ASSOCIATION.

There were 42 present at the monthly meeting of the New England Association of Ice Cream Manufacturers held at the American House, Boston, on April 16, 1921. It was announced that the executive committee voted that hereafter all regular monthly meetings of the association be for all members. It was announced that the executive committee had voted a contribution of \$100 to the U. S. Chamber of Commerce toward their building fund.

A letter was read from The Ice Cream Review relative to Cone Week. It was left to the secretary to find out what was contemplated being done. The Nation Slogan Contest was taken up and discussed thoroughly, the association going on record as being back of it.

It was voted that the association offer \$100 additional prize for the slogan providing the winner is a resident of New England, and also that the association prepare window strips and contest blanks to be distributed free to ice cream manufacturers in New England. The secretary was instructed to prepare copy relative to the slogan contest that could be used in local papers and send them to ice cream manufacturers. It was recommended that manufacturers of the different group cities or markets get together to advertise the slogan contest and share the expense.

O. S. Jordan, president of the Association of Ice Cream Supply Men, gave a short talk about co-operation and the recent ruling of his association on sectional and state shows.

Professor Judkins invited the association to spend May 22 at the Massachusetts Agricultural College following the Springfield meeting on May 21.

MISSOURI COMPANY TO HAVE NEW HOME.

The Mitchell Dairy Co., Kirksville, Mo., is having plans drawn for the erection of a modern plant with a capacity of 500 gallons of milk, 500 pounds of butter and 100 gallons of ice cream a day. Officials expect the plant to be completed by September 1.

Appalling Carelessness in Granting Credit in Ice Cream Industry

An Address Before Last Annual Convention of Illinois Association

By Z. G. GASSMANN*

HISTORIANS tell us that in the earliest times of man's existence credit was virtually unknown. In those days might made right, the stronger possessed himself at will of the property of the weaker, and since the problem of payment did not arise, neither did the problem of credit. But times have changed, and the law of might has gradually given way to the law of right. Possession by exchange, rather than by conquest, has come into existence.

And as the law of right gradually replaced its more vigorous predecessor, there came a growing confidence of man in his fellow-man. Though this confidence is at times sorely tried and even broken, yet it is confidence that is the basis for our present day credit.

Anyone who makes an examination of the credit side of any business, whether wholesale or retail, is appalled by the carelessness with which credit is granted, and the fact that as a group we are careless in granting credit is hardly controverted. There are many reasons for this seeming neglect on the part of the manufacturers to make inquiry into the proper amount of credit to which a customer is entitled, if he is entitled to credit at all.

Ignorance of the costs of doing business, credit losses and collections, desire to outdo competitors in volume of business without regard to the quality of the business, fear of driving away business by requesting credit information, and lack of a definite collection policy are some of the reasons responsible for the stupendous losses we suffer. Is there a remedy? I believe there is.

In my estimation, careless granting of credit and a desire to get additional volume are the greatest obstacles to the cutting down of our losses. When spring arrives after the long, cold winter, most of us are ready and willing to take any and all business that comes our way, with little examination or investigation. A competitor's customer calls us and gives us an order. Do we find the reason for his sudden change of heart? An inquiry might save us considerable trouble, worry, and perhaps a loss.

* President Illinois Association of Ice Cream Manufacturers.

JUST last summer we had an experience which illustrates my point. A customer who never should have been extended credit in the first place quit us owing a large balance. We immediately took steps to protect our interests, resulting in an uncollectable judgment. Despite the fact that this information was a matter of record, he was able to buy from two other manufacturers for the next sixty days, and both of them have told me that they came in for a nice slice of experience also. Our loss would have been avoided if we had been possessed of enough backbone to refuse credit in the first place, thus keeping the account on a strictly cash basis. The loss of our competitors could have been avoided by a timely investigation of the customer's credit status when he quit us.

Credit information on the average account in the ice cream business is usually available if one is willing to go after it. Conditions vary in different communities and the city store presents a different credit problem than the small town store or restaurant.

There are several sources of credit information with which all of us are more or less acquainted. We may get information from: (1) agencies, (2) banks, (3) personal calls and investigations by salesmen, (4) other manufacturers.

Agency information is usually reliable, where it can be obtained. The great trouble in rural communities is that the small store or restaurant is not rated. Information from local banks, while usually honest, is of little value for credit purposes. Banks as a rule will not misrepresent, but are reticent about giving definite information about a local dealer, who is usually a customer of the bank.

A great deal of dependence can be placed on information secured by the personal investigation. While this is the most expensive means of securing information, it is practicable in the ice cream business and is the cheapest in the long run.

Interchange of information is highly desirable though I hardly believe that the industry has reached

BOOST NOW FOR SUCCESS OF NATIONAL CONVENTION, NEW ORLEANS, NOVEMBER 17-20, 1924.

THERE are times when you want privacy in operation—buying—selling—seeking—or acting in any way; when for a short time you would prefer to act independently of those associated with you.

At such times a classified advertisement will prove to be an ideal agent, working discreetly and privately. It will not reveal your identity nor disclose more details than you are willing to have disclosed. It operates silently and efficiently, introducing you to other individuals with whom you can negotiate by mail or in person.

Classified advertisements in The Ice Cream Review are the dairy products man's *confidential agent*. Insert them under any of the following headings:

**Wanted-to-Buy
For Sale
Business Opportunities
Employee Wanted
Position Wanted**

Cost is but 2c per word. Write out your advertisement and mail with check or money order to The Ice Cream Review, 5th and Cherry Streets, Milwaukee, Wisconsin.

*Classified Advertisements
are found in the last pages
of this issue.*

stage where a credit bureau in our association could be successfully operated.

But eventually we come back to the original statement that "credit is based on confidence."

"Have we confidence in the men we sell?" is a simple question, yet the answer to it would solve many of our credit problems.

SOMEONE has said that the proper time to consider the payment of an account is before the account is opened, and there is little doubt that such a procedure would greatly simplify our credit and collection problems. A clear understanding of what is expected of the customer has never driven away any desirable business, rather, it has put business on a better and firmer basis. Prompt payment of due accounts should never be regarded as a courtesy or spoken of as a favor. In our own business we have tried to impress on our customers that we expect to pay with the same promptness that they expect us to ship their orders. Education is a slow process, but a policy such as this, put into force and firmly held to will work wonders in a remarkably short time.

There is no doubt that the house which insists on prompt payment is more respected by its customers than is its easy-going competitor. Experience in ice cream and other lines has shown that the maintenance of a prompt payment policy drives away no profitable business.

Discounts for prompt payment are in vogue in the ice cream business at this time and are being used with varying measures of success. This system has worked successfully where strictly applied to the letter, giving no discounts after the expiration date. When a customer will not pay in time to take advantage of a five or ten per cent discount, he is usually a customer to watch closely. As one manufacturer put it, "the discount system separates the sheep from the goats immediately."

CREDIT insurance is used by a few manufacturers. As a rule the credit risk in the ice cream business is sufficiently distributed to justify the policy of setting up a reserve for bad debts instead of taking out insurance.

A good collector always is courteous and tactful, but he is not easily fooled by the customer who tries to take advantage of him. He is not easily "stood off" by promises of an early payment, neither will he long be in ignorance of a delinquent's true condition. He is always ready to grant an extension when a valid reason exists, but he does it with the implied understanding that such an extension is an unusual occurrence, granted only as a special favor for the present occasion, and that no repetition of the request is expected.

The manufacturer who maintains such a policy, and who at all times remains unruffled, courteous and cheerful in his credit management will not only minimize his losses, but will, by his attitude teach his customers to employ correct collection principles in their own business, thereby making them stronger business men and consequently better credit risks as customers of his house.

JENSEN VERTICAL COIL VATS have been on the market only a few years — Horizontal Coil Vats for thirty years

JENSEN PATENTS PROHIBIT

other manufacturers from making and selling vats with Vertical suspended heating and cooling coils.

With approximately thirteen salesmen selling vertical suspended coil vats (exclusively Jensen's) and thirteen hundred salesmen selling the old style "horizontal" coil vats that can be made by any manufacturer is it any wonder that the thirteen hundred voices make themselves felt when they say "Do not buy Square Verticals." And yet three hundred thousand dollars worth of vertical coil machines have been installed within past six months.

The horizontal coil machine does not offer the plant owner a single advantage that he cannot secure in a Vertical Coil Machine and in the Vertical he secures in addition —

Freedom from Stuffing Box Contamination — Freedom from Air (and Foam) Incorporation — Elimination of Air and Noxious Gases and many other desirable features.

A post card will bring you a bulletin on "starter" and buttermilk making that is worth reading. It tells among other things how "Buttermilk" (cultured milk) is being made day after day without the necessity of carrying and caring for "mother" culture in a laboratory.

EVERY AD IN THE REVIEW HAS AN INTERESTING MESSAGE FOR YOU.

USE INTERNATIONAL STANDARD FITTINGS.

(Continued from page 132)

necessary to make this standard and interchangeable fitting the best, as stated, that human ingenuity could devise.

With that end in view, Chairman Forster arranged a conference with the committee's engineer and the manufacturers in question. After several conferences, they finally agreed on this change, which in their opinion would provide for the best possible standard fitting.

Samples were made up by these manufacturers according to the revised specifications and accordingly a new tracing was made and submitted to the various manufacturers and other associations interested for the purpose of securing their respective approvals.

The next problem which presented itself to the conference, in order to bring about the manufacture of the standard fitting, was the necessity of obtaining steel gages. The central office of the International Association of Milk Dealers negotiated with one of the large manufacturers of steel gages for the purpose of securing the best possible prices on behalf of each of the manufacturers, for a set of master gages. The idea was that the gages being made by one firm for all the manufacturers making the fitting, would secure absolute uniformity and also that one set might be retained in the office of the International Association of Milk Dealers in Chicago to which any purchaser of sanitary fittings could submit their fittings at any time for test in the event of any question as to their imperfection.

The time between the last convention of the International Association of Milk Dealers at Syracuse, N. Y., October, 1923, and the date of this present article, has been consumed with the manufacturers of gages and the

manufacturers of fittings in accomplishing a set of specifications and blue prints that would be satisfactory to each manufacturer.

These gages were promised for delivery not later than April 15, which will mean that the International Standard Interchangeable Sanitary Fitting, which we have been working on for the past three years, will be placed on the market by the manufacturers not later than May 1.

At this date the problem is placed squarely before the user, the dairy industry, as to whether this great undertaking has been justified. The manufacturers of these fittings have co-operated with your joint committees in the perfection of the fitting. They have done so at a great expense because it has been necessary for them to make new patterns, tools and dies in order to manufacture this new standard fitting and their old tools and dies will be scraped, which has cost them thousands of dollars.

Using the words of Chairman Forster of the committee: "We must not let it be said that we have asked the manufacturers to make the fitting and then refused to purchase it. I am sure that each and every member will stand behind the work of the committee and the manufacturers, and demonstrate their good faith by purchasing no other than International Standard Fittings."

The labors of the joint committees, in developing the standard fitting, as requested by the industry at large are through. They submit to you that they have accepted your commission, have performed the labor which you requested of them, and in return they ask that you justify that duty which you delegated to them, by specifying in the future on your orders in every instance, the International Standard Sanitary Fitting. In this way and only in this way can the universal adoption of the fitting and the benefit to be derived from this standardization be ultimately secured. The success of this undertaking now rests entirely in your hands. That confidence, I am sure, you will prove to the manufacturer has not been misplaced.

OHIO AND INDIANA NOTES.

By C. J. Yunker.

The proprietors of Watts Bros.' Ice Cream Company, Logansport, Ind., mourn the loss of their father by death, whose name was Isaac N. Watts, at 510 West Miami St., Logansport, Ind.

* * *

The Julia Ross Ice Cream Co., Cincinnati, O., has been incorporated for \$10,000.

* * *

Watts Bros. Ice Cream Co., Logansport, Ind., has added another new ice cream truck to its fleet and are usual are putting on their regular color of paint as their tubs, etc. Getting ready for Spring—they believe in keeping things bright.

News From Far and Near

CALIFORNIA

FLORIDA

Gadsden, Ala.—L. E. Lokey and C. W. Singleton have purchased the plant of the Marshal Ice Cream Co., which they will remodel, installing new equipment.

Dothan, Ala.—Work on the new building is being rushed to completion and machinery is also being installed for a creamery. When the building is completed it will be one of the most modern in the state. For some years leading citizens have felt the need of a creamery in Dothan in order to create more interest in diversification from cotton as the staple crop. A high grade of creamery butter is already being put on the market by this company of which J. W. Parkman is manager.

Blytheville, Ark.—New machinery and several interior improvements are being installed in the Blytheville Ice Cream Co. building on Fifth and Main streets.

Los Angeles, Cal.—All buildings of the Globe Ice Cream Company, located at the corner of Jefferson and Hill streets, are now completed. The mammoth sanitary, scientific plant of the Grove Ice Cream Company now being fully completed represents an investment of \$1,000,000. In order to celebrate the completion of this factory a grand opening will be held for five days.

Jacksonville, Fla.—Herman A. Haft and D. W. Anderson, operating under the firm name of Haft's will open a new ice cream plant at 1733 Main street, where they will turn out the choicest of ices for their local patrons.

Davenport, Ia.—The Banner Creamery Co., a concern sponsored largely by Moline business men, has acquired the Venholz ice cream factory at 2300 Fifth Avenue, Moline. The new owners took over the management of the business today and announcement was made that there will be no interruption in the operation of the factory.

Officers of the Banner Creamery Company plan to manufacture a complete line of dairy products, featuring ice cream and table butter made entirely from sweet cream. It is also

planned to open dairy stores in other cities and negotiations with the chamber of commerce in one of the leading cities of Kentucky have been opened with a view of establishing a second factory at that place.

Maplehurst, Iowa.—The Maplehurst Dairy Co. gave away 20 dozen Eskimo pies each evening and Wednesday afternoon at the Better Homes Show.

Onawa, Ia.—Turin's only eating establishment is the Turin Cafe and Ice Cream Parlor, which has been under the management of J. J. Roeberg since January 1st of this year he having purchased the business from Glenn Edwards.

Mr. Roeberg has greatly improved the place, installing new fixtures and a soda fountain.

Oelwein, Ia.—The Crowell Ice Cream Company is erecting a building on West Charles just this side of the viaduct for their enlarged business. This building is to be 30x65, a fire proof structure of concrete and hollow tile, with brick front. It faces on Charles street and will be quite convenient for shipping purposes as it is close to the railroad. The building is to be an up-to-date factory with a handsome front and one that will be quite an improvement to the city. They will be temporarily located in the Flynn Dairy building until their new one is completed in the early part of May.

The Larson Dairy is moving into the room vacated by the Crowell Company and are putting in a large pasteurizing plant.

Maquoketa, Ia.—The Kirchoff Ice and Ice Cream Co. has enlarged its business and Arthur Nichols of State Center, will have charge of the dairy department of the plant.

Monticello, Ia.—The Hutchinson Ice Cream Co. of Cedar Rapids has opened its seventeenth factory, which is located in Monticello, under the management of Herman Schneider, a Monticello man, who has taken a course in dairying at Ames, and has a great deal of experience along the line of work upon which he is entering.

Chicago, Ill.—T. F. McGuire Ice Cream Company at 4263 Elston Avenue has been incorporated with a capital of \$60,000. Incorporators are Max Setlmeir, Robert H. Hendrickson and Herman Kaus.

Indianapolis, Ind.—George Killis opened an ice cream manufacturing business at 21 South West Street.

Carroll, Ia.—Wholesale ice cream manufacturers from this district assembled in convention in Carroll to discuss trade abuses.

Colfax, Iowa.—The Porter Farming Co., announce that they are starting their ice cream factory again.

Monticello, Ia.—A quantity of machinery has been shipped to Monticello by the Hutchinson Ice Cream Co. of Cedar Rapids. It is at present being installed in a large brick building in the rear of the Franklin Barn Equipment Co. The Monticello factory will be in charge of Herman Schneider.

Chicago, Ill.—Silver Ice Cream Co., Inc., 4540 State St., has been organized with a capital of \$50,000. It will manufacture and deal in ice, ice cream, sweets, etc. Incorporators: G. W. Dobbins, R. A. Barker, P. H. Curry, M. F. Fuller.

Chicago, Ill.—Goldenrod Ice Cream Company, 937 W. 21st St., has incorporated with a capital of \$1,500,000. Incorporators are Irving Sacks, R. F. Bippus, Louis Olin and G. D. Rose.

Rensselaer, Ind.—The Rensselaer Ice Cream and Supply Company has been formed with a capital of \$10,000. The directors are H. E. Randle, W. R. Coffroth, L. M. Ellis, P. P. Grove and J. W. Klink.

Terre Haute, Ind.—Taylor Ice Cream Company has been organized with a capital of \$5,000 to manufacture ice cream and confectioneries; directors are Charles Taylor, Andrew Taylor and Charlotte Taylor.

Downs, Kan.—H. Edell has opened an ice cream factory here.

Marysville, Kan.—The Marysville Ice Cream Company has begun business under the management of S. B. Hamphill. He recently purchased the equipment of the Purity Ice Cream Co. and has his plant located in the same quarters as the latter company had in the ice plant.

Crowley, Ia.—The Riceland Ice Cream and Creamery, successors to The Farrell Ice Cream Co., has installed several new units of machinery for improving the plant and products, the latest thing being a homogenizer for the more perfect blending of the cream.

Cambridge, Mass.—Mansion House Ice Cream Co., Cambridge, has been incorporated with a capital of \$300,000; incorporators are William P. Sutton, Matilda J. Sutton and Esther V. Sutton, all of Cambridge.

Cambridgeport, Mass.—A crew of 200 men, groups of whom cleared the ruins, while others followed to renovate the building, were set to work less than six hours after the firemen had quit the Cambridge ice cream plant of the H. P.

BIRMINGHAM, ALABAMA

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Wood & Sons Co., Cambridge and Albany Sts., and by 3 p. m. the ammonia freezing system had been reinstalled. The manufacture of ice cream will now be resumed.

Springfield, Mass.—Tait Bros., ice cream manufacturers and milk dealers, have offered to the Park Department a tract of land adjoining the Armory Street Reservoir to be added to that park.

Charlotte, Mich.—The Snow Ice Cream Company has purchased the plant of the Artificial Ice Company which was started in 1908 by the L. H. Shepherd Grain, Bean and Milling Company, and which has done a very flourishing business since that time. Through the manufacture of a superior grade of ice cream the Snow Ice Cream Company has established a good business and the plant which is located in the same building naturally goes with their business. With a few alterations the two plants will be converted into one. Ice will be sold to the city residential trade as heretofore.

Clarksdale, Miss.—McLeran Ice Cream Co., has organized with a capital of \$14,000. John S. Garmon, J. S. Hays and others are the incorporators.

Jefferson City, Mo.—Frank J. Gorbes has disposed of his interest in the Purity Ice Cream Co. to E. H. Wilburs.

Eldorado Springs, Mo.—G. E. Tucker, proprietor of the Eldorado Ice Cream and Bottling Works, will soon install new machinery in his ice cream department.

Lincoln, Neb.—The attorney general was asked to give an opinion whether discrimination in cream prices is punishable under the Nebraska uniform price law or the anti-discrimination law. Many complaints have been received of cases where cream sold at competitive points brings a price higher than that paid for the same quality at non-competitive stations nearby.

Asheville, N. C.—H. Broby of the Carolina Creamery Co., manufacturers of ice cream here, has announced completion of arrangements and the installation of new equipment.

Brooklyn, N. Y.—Eclipse Ice Cream Company has incorporated with a capital of \$10,000.

Durham, N. C.—In 1920, the Waverly Ice Cream Co., on Holland street, installed complete new machinery and equipment. The equipment is said to be as good as that of any plant in the South, and enlargements are now being made, in order to increase the capacity of the plant.

Officers of the company are: A. J. Pollard, president; H. J. Pollard, vice-president and general manager; W. P. Lucas, treasurer; Miss Leah Pope, secretary and treasurer.

Greensboro, N. C.—The White Rose Ice Cream Co., has been organized, with authorized capital stock of class "A" stock at \$100 per share and 248 shares of class "B" stock without nominal or par value. The subscribers are W. A. James, J. L. Robinson, and W. S. Lyon, all of Greensboro.

Hamlet, N. C.—An amendment has been made to the charter of Buttercup Ice Cream Company, and its capital stock increased from \$100,000 to \$150,000.

Fargo, N. D.—The plant of the Frank O. Knerr Dairy Co., which opened two years ago in a new large brick building, is being enlarged to nearly double its present capacity because of increased business, due, Mr. Knerr says, to increased dairymen in the district. The company, founded in 1907, made 15 per cent of all ice cream made in North Dakota during 1923.

Grand Forks, N. D.—S. J. DaDue of Minot was re-elected president of the North Dakota Ice Cream Manufacturers' Association at the annual convention here. Other officers are: H. S. Shulte, Mandan, vice-president; E. K. Geise of Grand Forks, re-elected secretary; Frank O. Knorr and H. Christian of Fargo, directors.

Grand Forks, N. D.—S. J. LaDue of Minot, was re-elected president of the North Dakota Ice Cream Manufacturers' Association at the close of the annual convention. Other officers are: H. S. Shulte, Mandan, vice-president; H. K. Shulte, Grand Forks, re-elected secretary; Frank O. Knerr and H. Christian of Fargo, directors.

Camden, N. J.—Venice Spumoni Co., manufacturing ice cream, has been organized at Camden with a capital of \$5,000.

Dover, N. J.—F. Chapin Weed of Allentown, Pa., ice cream maker, who distributed ice cream in Dover for the past 20 years, has purchased the ice cream business of Oron P. Le and will continue manufacturing at the plant recently moved to the old Morris county machine shops property in Farlan Street from Cole's former stand in East Blackwell Street.

Brooklyn, N. Y.—Arc Ice Cream Distributors' Company has been organized with a capital of \$10,000, by M. Herschaft and M. Tachna.

Brooklyn, N. Y.—The Eclipse Ice Cream Company has been organized by H. A. Leonard, B. Bretan and V. Zweig, with a capital of \$10,000.

Hornell, N. Y.—The Purity Ice Cream Company of this city of which Paul J. Johnner, the oldest ice cream manufacturer in the city, is the proprietor, is gaining wide favor through its recent new and delicious offering, Kist ice cream.

Olean, N. Y.—The First National Bank recently purchased the buildings, equipment, and stock of the Jersey Ice Cream Company in Portville, at a public hearing held in County Surrogate George A. Larkin's office. The deal was transacted following bids of stockholders and officials of the company. The company's equipment, stock and buildings were sold for \$17,400.

Syracuse, N. Y.—The Dairymen's League Co-operative Association, Inc., has opened its Syracuse plant for manufacture and distribution of Dairylea Ice Cream. The business occupies the former Crystal Springs bottling plant in Burnet Avenue, held under lease. The plant is the seventh owned by the association, and negotiations are under way to establish the eighth factory and distribution center at Binghamton. Eighty men are employed here making, packing and transporting Dairylea ice cream to all parts of the county. Seven trucks and three light motor deliveries are employed.

Chillicothe, Ohio.—Ohio will probably have an ice cream week early in June.

Columbus, Ohio.—Receivers of the R. L. Dollings Company were authorized to sell the common stock of the Crane Ohio Ice Cream Company at \$10 a share, by common pleas Judge Duncan. Preferred stock holders of the Crane Ohio Company fought the disposal of the stock but Judge Duncan held it was the property of the Dollings Company, which organized the ice cream concern. The court authorized the sale of most of the stock to Stanley M. Ross and Harry C. Moores, of the Moores and Ross Milk Company of Columbus, which, with the Maple Dell Ice Cream Company, formed the Crane Ohio Company. Consideration was \$94,500, but the money will be held by the receivers subject to action by the upper courts to which preferred stockholders of the Crane Ohio Company will appeal.

Cincinnati, O.—The Julia Ross Ice Cream Co., has been organized by Julia Ross, with a capital stock of \$10,000.

Dayton, Ohio.—Ice cream manufacturers and milk distributors from a number of counties in western and southwestern Ohio met at the Gibbons Hotel to make provisions to improve the quality of food products and to establish better sanitary conditions generally. Ice cream manufacturers attended from Auglaize, Clark, Champaign, Darke, Fayette, Greene, Logan, Montgomery, Miami, Mercer, Preble and Shelby counties. The milk distributors came from Allen, Auglaize, Clark, Champaign, Darke, Fayette, Greene, Montgomery, Mercer, Miami, Preble, Shelby and Van Wert counties.

Maumee, O.—Creamery and ice cream men from 15 southeastern Ohio counties and part of West Virginia met at Athens and planned a campaign to make all cream stations sanitary.

Clinton, Okla.—The new Clinton Ice Cream factory was opened for business April 1. W. E. Bright and Otto S. Pearman are owners and operators of the company.

Punxsutawney, Okla.—The Mahoning Ice Cream Company has been organized by P. L. Brown, with a capital of \$75,000.

Altoona, Pa.—A permit for the erection of a one-story brick building at Industrial avenue and Twenty-eighth street for the Penn-Cress Ice Cream Company was issued to F. J. Cupples. The building will cost \$18,000 and will be used as a distributing plant, the ice cream being brought here from the plant in Cresson.

Corry, Pa.—Work is now under way on the remodeling of the old Keating block on W. Main St., which will be occupied by the Corry branch of the Levant Ice Cream Company.

Hamburg, Pa.—A. P. Wertley, ice cream manufacturer, whose plant has been located on Apple alley, south of State street, for many years, will soon be housed in quarters now nearing completion at his large ice house along the Philadelphia-Pottsville state highway at the southern borough boundary. Removal of two of the freezing machines is now in progress. Two more of these machines have been ordered and are on the way to arrive within the next few days. As soon as these are installed the two remaining machines in the town plant will be transferred, after which all the ice cream will be manufactured in the new plant, which will have a greater capacity than the old one.

Harrisburg, Pa.—The Mulholland Ice Cream Co. has been incorporated with a capital of \$100,000, the incorporators being Thos. J. Mulholland, Simpson; R. H. Kerwin and C. H. Taylor, Carbondale.

Philadelphia, Pa.—Abbotts' Alderney Dairies, Inc., have just completed their first five years in the manufacture of ice cream. With the completion of extensive improvements to their plant at Third and Lombard streets, it becomes one

AMONG THE BRIGHTEST THINGS IN THE REVIEW ARE THE ADS—READ THEM.

of the largest and most modern ice cream plants in the world. In this plant the manufacture of ice cream has been developed to a remarkable degree of efficiency.

Reading, Pa.—Protection of Reading ice cream manufacturers, by repeal of the strict ordinance regulating the quality of their product, is promised by Mayor Sharman. He said that the city ordinance tends to discourage home producers because foreign manufacturers, by making ice cream on a larger scale, can meet the requirements, while local products often show negative tests.

Sunbury, Pa.—Oswald Yeager and John Shindel, well known local young men, have taken out a building permit for the erection of a single story building on North Sixth St., between Race and the "Horn," to be used in the manufacture of ice cream for the wholesale and retail trade.

Harry Hoffman, who for many years was engaged in the ice cream business on Pennsylvania Avenue, will be associated with the new firm for a time and they will turn out the famous Hoffman brand of ice cream. They expect to be ready for operation about June 1.

Westminster, Pa.—Announcement has been made of the organization of the Zile-Neuman Co. with a capital of \$150,000, composed of Arthur Z. Zile and the Neuman Ice Cream Company, York, Pa. The new company has taken over the factory and dwelling of Mr. Zile on East Main Street, Westminster. Mr. Zile has devoted nearly 20 years to the ice cream business.

Charleston, S. C.—Ashley Ice Cream Co. increased its capital from \$25,000 to \$50,000.

Memphis, Tenn.—The Liberty Ice Cream Company, Inc., was organized in November, 1923. This company has a new plant, with all modern equipment, and pride themselves on its cleanliness and sanitation.

Memphis, Tenn.—The Superior Ice Cream Company, recently incorporated with a capital stock of \$50,000, announces the perfection of its organization and the installation of equipment that will enable it to serve the local retail trade adequately during the summer season.

The concern is operating four delivery trucks. The company also is shipping cream to a fast-growing list of dealers in the tri-state territory. Deliveries are made to homes only in the case of purchases which the retail dealers cannot handle.

Memphis, Tenn.—Liberty Ice Cream Co., 939 Walker St., with a capital of \$20,000, has been incorporated by R. H. Rosmuncer, C. E. Duvall and others.

Memphis, Tenn.—Ben Bluestein has opened a wholesale ice cream manufacturing plant at Fourth street and Linden Avenue. Mr. Bluestein will be president, general manager and treasurer of the new establishment. Associated with him will be Milton D. Therry as vice-president; W. B. LaCroix, secretary, and Clyde Washburn, A. J. Cook, of A. J. Cook & Co., directors. The new concern, called the Superior Ice Cream Company, is capitalized at \$50,000, and while it is a wholesale plant, will have molds for home distribution.

Memphis, Tenn.—The Pig and Whistle Ice Cream Company bears a unique name but makes an unusually high grade of ice cream and sherbet, officials of the company say. They recently moved to 366 Beale Avenue from their former home on Linden Avenue, due to the necessity for larger quarters to accommodate a rapidly growing business. Thos. Poulus is the manager.

Nashville, Tenn.—To show the mothers and teachers of Nashville how a modern ice cream manufacturing plant is operated, W. E. Drake, general manager of the Union Ice Cream Company, kept open house at his plant for the members of the Parent-Teachers' Association of Nashville. Nearly 100 representatives from among the parents and teachers of the city, and from every public school of Nashville, visited the plant at 1158 Broadway. The visitors were shown through every department of the plant, from the laboratory, where daily chemical tests are made of all milk and cream used, to the fancy mould room, where individual ices in 300 different moulds are prepared for special parties and entertainments. On leaving every guest was presented with a carton containing several of these individual ices, together with a bouquet of jonquils as souvenirs of the day.

Tracy City, Tenn.—C. C. Jones of Lebanon, Tenn., has taken over the plant adjoining that of the Mountain Ice & Cold Storage Company, and within a few weeks will begin the manufacture of ice cream, having already placed orders for the necessary equipment, and operations will begin as soon as the equipment arrives and is installed. Heretofore residents of this city have had to depend on other cities for their ice cream during the hot summer months.

Austin, Tex.—The Nacogdoches Ice Cream Company has been incorporated by Eugene H. Blount, R. G. Muckleroy and H. Spindler.

Brownsville, Tex.—C. C. Lambreth has started to build modern ice cream plant which will have a capacity of 50 gallons a day.

Bronte, Tex.—C. W. Luttrell, proprietor of the Three Minute Cafe at Bronte, is installing the machinery for an ice cream factory.

Cisco, Tex.—Equipment for a modern ice cream plant has been shipped from Omaha, Neb., and when it arrives Banner Ice Cream Company of Ranger and Breckenridge will open a plant in the building at 4th street and Avenue F.

Houston, Tex.—The Rettig Ice Cream Co., Louisiana and Jefferson Streets, has opened for business.

Port Arthur, Tex.—Work of installing some \$14,000 worth of additional equipment in the Kewpie Ice Cream Company's Port Arthur plant will be completed within the next two weeks.

Wichita Falls, Tex.—The Bright Ice Cream Company has been incorporated with a capital of \$6,000. Incorporators are W. R. Alexander, W. H. Waegner and E. C. Stuart.

Staunton, Va.—The Staunton Creamery has been incorporated by E. W. Holsinger, president, and A. F. Howard secretary, with a capital of \$10,000.

Kennewick, Wash.—The first full car-load of butter was shipped January 31, by Paul Spreen, proprietor of the D Sota creamery. It contained 270 cubes weighing 18,36 pounds which brought approximately \$8,000 cash f. o. b. Kennewick and was shipped via the Northern Pacific to Los Angeles.

Shelton, Wash.—The Shelton Creamery, operated by the Mason County Fruit Growers' Association, has installed a big power ice cream freezer of forty quart capacity, and is completing arrangements for supplying the trade of Mason county hereafter. The new plant will be operated in connection with the refrigerating system of the creamery and is expected to open a new market for the fresh cream produced in the county.

Grafton, W. Va.—Early in April, the Imperial Ice Cream Company will erect a two-story ice cream plant in that city. The building alone will cost \$40,000.

Wheeling, W. Va.—The erection of the new home of Ale Durst's Sons, local ice cream manufacturers, at 1210 Chaplin St. is rapidly nearing completion.

Burlington, Wis.—The Kellogg Ice Cream Company of Burlington has purchased a new G. M. C. truck which will be used for making deliveries in this territory.

Gibson, Wis.—At the Gibson Ice Cream Company's annual meeting officers and directors elected were: President, T. J. Gibson; vice-president, N. G. Hall; secretary, A. A. Gibson; treasurer, Zebina Gibson. The directors elected were: T. J. Gibson, N. G. Hall, A. A. Gibson, Zebina Gibson and John C. Gibson.

Ladysmith, Wis.—Undersheriff Jim Moore and Leo L. Schoepf have purchased the Ladysmith Ice Cream Co. from Aune and Hoveland. Mr. Schoepf will have the selling end of the business and Mr. Moore the general supervision of the factory.

Milwaukee, Wis.—The capital stock of the Luick Ice Cream Company of Milwaukee, Wis., has been increased from \$800,000 to \$1,300,000. It is also announced that James W. Martin, a well known advertising expert of the Middle West, has joined the executive staff of the company as sales manager.

Rhineland, Wis.—The Oneida Milk and Ice Cream Company at South Stevens St. has added five new machines to their plant.

Ripon, Wis.—The Ripon Ice Cream Co. recently bought the Berlin Ice Cream and Dairy Products Company of Berlin. It also added a freezer to its plant.

Sturgeon Bay, Wis.—Frank Pleck, who for a number of years manufactured ice cream in this city, but several years ago sold out to the Hagemester Products Company, is preparing to again enter the business on a large scale. Joseph Weirichs of Algoma is to be associated with Mr. Pleck in the business and it will not be confined to the manufacture of ice cream, but milk, cream and butter will also be handled. Mr. Weirich was formerly a resident of Egg Harbor, and is an experienced milk man.

Sparta, Wis.—"Spartan" is the name chosen out of several hundred, as the most desirable one for the new ice cream products to be made by the Dairy Food Products Company. Two girls sent in the same name, Miss Sybil Perry and Leah Quakenbush and each received a sum of \$15 for a prize.

First Diner-out—"Why did you tip that boy so handsomely when he gave you your coat?"

Second Ditto—"Look at the coat he gave me!"—Answers

The ICE CREAM REVIEW

Milwaukee, Wisconsin—June, 1924
VOLUME SEVEN — NUMBER ELEVEN
TWO DOLLARS PER YEAR

Breyer Ice Cream Co.

Battery of three Cherry 100-Quart Freezers with Thomas Batch Measures, installed on the Brick Ice Cream Balcony of the new Breyer plant. Brick making machines under the balcony.

A battery of twelve of the twenty-one Cherry 100-Quart Freezers in the new Breyer plant.

Here you see two views of the twelve 1000-gallon Cherry Ice Cream Batch Mixers and Aging Tanks installed by Breyer in their new plant.

These are vitrified enamel, direct motor driven. The tanks in the foreground of the lower picture are pre-heaters—two being sunken in the floor for ease in dumping cream.

Knows! How!

This company in Philadelphia is using thirty-nine Cherry Freezers—twenty-one in their new plant and eighteen in their old plant. Besides this complete Cherry Freezer equipment they have installed twelve 1,000 gallon Cherry Horizontal Ice Cream Batch Mixers.

Cherry won after gruelling competitive test!

Before the Breyer Company decided upon Cherry Freezers it conducted an open competitive test, covering ninety days and in which Cherry and several other leading makes participated. Accurate day by day and hour by hour records were kept. At the end of sixty days all but Cherry and one other make of freezer were eliminated.

At the end of ninety days the Cherry 100-Quart Freezer won out because of unqualified and complete excellence of performance under varying difficult conditions imposed and the proven reduction in power consumption by the use of SKF ball bearings.

If you have not received our latest Freezer catalog—write for a copy today. Remember it is just as easy and cheaper too, to buy the best.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

THE 125 MEMBERS of this Association believe in national organization for industrial protection and advancement. They observe on all sides those industries forging forward which have the strongest, most inclusive national associations The ice cream industry today is faced with a proposed Federal standard, with many intricate and serious problems of distribution, equipment and materials. Its National Association is defending and laboring to advance the interests of the industry in its entirety We believe in the mission of the National Association of Ice Cream Manufacturers and that its success will be found to be the measure of the industry's success.

JUNE 1924

"THE time has come," the walrus said. These are busy days around the ice cream plants. Again spring weather was a little slow in opening up, but ice cream manufacturers are now at high speed and within another few weeks will be wondering how in the world their equipment will ever be able to stand up under the rush. This is something that should have been attended to early in the spring, but if you have been careless in organizing for the summer drive, you will find it good advice to get busy right now and see that everything is in readiness.

It would not be a bad idea for you to turn through the pages of this issue and make sure that you have everything you need. Delaying the matter another week or so will make it all the harder for you.

There are many reasons to believe that business will be better this year than ever before. It would be unfortunate for the ice cream industry to lose a large part of its share just because it is not fully prepared.

THOSE are very significant figures shown in the article in this issue dealing with the increase of soft drink consumption over ice cream. They should be an incentive to every ice cream manufacturer. That is the purpose of this discussion. There is no quarrel with the beverage industry. We must give them full credit for taking a product that has nothing like the health appeal of ice cream, nothing like the genuine palatableness and refreshing qualities, and so advance it in public popularity that it represents one of the truly great industries of the world today. Ten million dollars for soft drinks in one just fairly large city in one year—that tells an interesting story.

Ice cream is the national dish. We like to dwell upon that thought. It is true that it is typically American, but we have much ground to cover before we shall have ice cream established in its rightful place in this country.

We have not the co-operation of the dealers; they are leagued against us. They probably are unconscious of this, but the fact remains that virtually everything sold in the dealer's store has far more of a chance of attracting the public's eye than ice cream. Men who have studied salesmanship, especially retail salesmanship, know the value of the eye appeal. The dealers are not to blame when you consider that virtually the only people they ever see in their store from their ice cream manufacturers are salesmen and collectors with occasionally, now and then, an advertising man to place material. But the dealer has heard very little selling talk except that which is designed to show him why he should handle this or that manufacturer's ice cream. He is human, you know, and it is not a bit strange that he should finally reach the opinion that all that the manufacturers want is to unload a lot of ice cream on him—not the public.

We must help the dealer and show him how to draw the eyes of the public to ice cream. It is easy to line up the soda fountain with rows of bottles, packages of candy, chewing gum, wrapped fruit, salted nuts, etc., whereas ice cream cannot be so easily displayed. The windows, however, can be used for ice cream displays, and alert manufacturers can help the dealers put the ice cream appeal upon mirrors, with the judicious applying of paint and chalk.

We learn that in one Southern city, no larger than 250,000, the people spent ten million dollars for soft drinks in one year. That shows the stiff competition facing the ice cream industry. It explains in large measure why less ice cream is consumed in the Southern states than elsewhere. For a long time unthoughtful members of the industry have felt that it was the Southern ice cream manufacturers' lack of progressiveness that caused that section to lag in ice cream production, but the soft drink figures show a different reason. The figures should not be discouraging. On the contrary they show that people of the South will spend much money for the things they like. So will other people of other sections.

We must help them all to learn more about ice cream, and there is no doubt that they will like it.

WE HOBNOBBED with the wealthy for a couple of days last week at the world famous health resort. We didn't have money enough to be sick, so we just popped off to get the other fellow's viewpoint.

We strolled about the beautiful grounds and even played a game of golf. We realize that an editor is out of his element in such a place, but we managed to hide our identity for nearly forty-eight hours.

But we didn't start out to tell you all about this wonderful place. Let the proprietor do his own advertising. What we want to tell you about is our experience with a soda fountain in the town in which that resort is located. We were just "hankerin'" for a good ice cream soda. We picked out a corner drug store—the best in the town and we felt that here we would get something unusually good. This particular drug store was appealing to transients—most of them wealthy—for the biggest share of its business.

We ordered a chocolate nut sundae and settled down at a cozy corner expecting a real treat. We were not even worrying about the cost because it was the second time there and we were getting accustomed to cost shocks.

Imagine our disappointment when we got that sundae. I couldn't eat it in spite of the fact that we told you on this page a short time ago that we like ice cream so much that we can eat poor ice cream in preference to none at all. That was the cheapest, poorest ice cream that we ever encountered. The syrup and the nuts were of fine quality which was evidence to us that the dealer was trying to serve us something good. The ice cream was low in fat content, if any at all, and it was coarse. There was nothing about it to attract repeat orders, in fact it was no good.

We appealed to the proprietor and he agreed that the ice cream was poor. He said that complaints about its quality were numerous, but he has handled the same kind of ice cream for several years and he doesn't like change. He admitted that a change would come soon, however, if the manufacturer does not get back to the time quality.

We know nothing about the conditions surrounding the production of that particular ice cream, in fact we don't know who made it. We didn't want to know because we might find him a regular reader of The Ice Cream Review and then we would feel badly.

Our guess is that he is trying to see how cheaply he can make a gallon of ice cream. If this is his aim he is to be congratulated. He has struck rock bottom on the low cost of materials at least.

Why, oh why, will business men attempt to build a business that way? Why do they try to fly in the face of experience? Men have lost fortunes trying to build businesses on low quality and fraud. Why will they keep right on trying?

The time of year is at hand when ice cream manufacturers are tempted especially hard to lower the quality of their product. Some listen to the voice of the devil but the wise ones don't. They are building on quality and they never let the standard be lowered.

They are the men who are helping to popularize the National Dish.

The manufacturer who takes advantage of a brisk demand to lower the quality of his product is more than foolish. He is a traitor to this fine industry which depends upon high quality for its very existence.

These may be harsh words but we all need to appreciate the importance of keeping the standard high. The American consumer judges ice cream by the dish set before him and the only way to gain his confidence, and hold it, is to serve him good ice cream.

THE trade-at-large will receive with much interest the announcement in this issue that the Dixie Flyers, that singularly energetic body of supplymen operating in the Southern states, has made arrangements for one of the most elaborate exhibitions it has ever undertaken. This is to be staged in connection with the convention at New Orleans next fall. As this issue is going to press it is not definitely known if the Dixie Flyers will exhibit for the national convention, as well as for the Southern meeting. But it is known that the Flyers have sufficient space in the Winter Garden for 150 booths.

It is understood that the national supply association will carry out an entertainment program for the National Association of Ice Cream Manufacturers. As the matter now stands, in spite of the fact that there will be no exposition by the large national body of supplymen, there still is every reason to believe that the New Orleans convention will be the colorful event that it has promised from the first.

The decision of The Association of Ice Cream Supply Men not to hold an exhibition this year has met with disappointment among ice cream manufacturers of the South, who had been laying extensive plans for the important gathering of ice cream men to be held in their section in November. It is in this way that we get a very clear understanding of the importance which the ice cream manufacturers attach to the trade exhibits, especially to those conducted by the national supply association.

It is significant that the last two conventions held by the National Association of Ice Cream Manufacturers have been the most successful in point of attendance and general interest of any previous sessions, and association officials have not failed to give much of the credit to the interesting expositions which The Association of Ice Cream Supply Men provided.

Officials of the Dixie Flyers are to be commended for so promptly stepping into the breach. President Harry Benner's announcement that the show "is on" no doubt will serve to keep the hopes of the Southern ice cream men who have been so greatly counting upon making their 1924 convention one long to be remembered.

THE National Dairy Exposition this year will have a greater appeal to the ice cream manufacturers than any previous dairy show. In recent speeches W.

E. Skinner, secretary of the National Dairy Association, has declared that the 1924 show will hold more interest for all arms, branches and divisions of dairying in all sections of the country, than any ever staged.

The ice cream manufacturers will visit Milwaukee from all sections of the country. Exposition officials felt very sure of this even before announcement was made that there will be no national ice cream exposition this year. The ice cream industry is coming to a greater appreciation of the dairy show and its importance to their own advancement. Some of us have persisted in the fallacious belief that the manufacture of ice cream is an industry entirely separate from all other branches of dairying. It is true that to a great extent the ice cream manufacturer's problems are more peculiar to his line of business, but as the dairy economic scheme goes on in advancement, it is to be impressed with the fact that the paths of all arms of the dairy industry lie more or less in the same direction.

Proper milk supply has become one of the outstanding problems of the ice cream industry. Some manufacturers may lead themselves to believe they have no interest in the dairy industry, but in doing so they are blinding themselves to some important facts. We in the ice cream industry are in the dairy industry. There is absolutely no chance to get out of it so long as ice cream is to be made with milk and butter. Those manufacturers are better off in every way whose plants are located in regions where dairying has been extensively developed.

The 1924 National Dairy Exposition, although four months away, is attracting the widest interest among ice cream manufacturers. Milwaukee is getting ready for the coming of delegates on special trains from virtually every section of the country. The Ice Cream Review looks forward to welcoming to "America's Dairy Capital" friends in the ice cream industry from North, South, East and West, and all way stations.

MUCH satisfaction prevails as developments are unfolded in the slogan campaign of the National Association of Ice Cream Manufacturers. The campaign has been the means of giving ice cream considerable national advertising. No less important is the object lesson in the value of co-operation. Through the assistance of different state and regional associations the association was able to spread its advertising material in many homes throughout the country.

All of us will await with much interest announcement of the winning slogan in the campaign. This slogan itself will do much indeed to solidify the industry. The National Association of Ice Cream Manufacturers is to be congratulated. In carrying out this campaign it follows the suit of many of the great industries of the country that have recognized the value of co-operative advertising. It shows us that any business which is rendering a useful public service can afford to give its support to co-operative work, and the other kind has no business in business.

NATIONAL Ice Cream Cone Week opens June 9. Ice cream manufacturers in many sections of the country have taken steps to co-operate in teaching the public that the good ice cream cone is not merely a holder but also has a real food value. This is the first attempt to teach the consumer about the ice cream cone, which has become one of the most popular means of serving ice cream, popular both with the dealer and the public. Ice cream cone week comes close on the heels of the slogan campaign. It was purposely held back so it would not interfere with the efforts to interest people in the contest conducted by the slogan committee of the National Association of Ice Cream Manufacturers. This leaves the manufacturers free to give one week of concentrated efforts toward boosting the ice cream cone.

THE boys in blue marched again last month. They know something about war. They know it is bad business. So do the boys in gray, who marched again just a few weeks previous.

But in the ice cream industry it is different. We have not had quite enough war yet. All of us have not learned that there is nothing to be gained by stabbing and throat-cutting. Some day this will be changed. It's a pity we couldn't save all the money that it will cost to learn this lesson.

BULLETIN OF EVENTS

National Cone Week—Week of June 9, to be observed nationally with the co-operation of associations of ice cream manufacturers and the assistance of the Cone Manufacturers' Association. Secretary, the Cone Manufacturers' Association, 501 Cherry St., Milwaukee, Wis.

National Dairy Exposition—Wisconsin State Fair Grounds and the City Auditorium, Milwaukee, September 27 to October 4. Secretary, W. E. Skinner, 910 South Michigan Ave., Chicago.

Southern Association of Ice Cream Manufacturers—Twelfth Annual Convention, New Orleans, November 14 and 15, 1924. Secretary, J. W. Clopton, Decatur Ice Cream & Creamery Co., Decatur, Ala.

National Association of Ice Cream Manufacturers—Twenty-fourth Annual Convention, New Orleans, La., November 17, 18, 19 and 20, 1924. Secretary, N. Loewenstein, 155 N. Clark St., Chicago.

Louisiana Association of Ice Cream Manufacturers—Annual convention, November 21, 1924. New Orleans, La. Secretary, N. F. Manning, Monroe.

Texas Ice Cream Manufacturers' Association—Annual Convention, Dallas, first week in December, 1924. Secretary, A. White, San Antonio.

Oklahoma Association of Ice Cream Manufacturers—Annual Convention, Tulsa, December 8-9-10. Secretary, W. M. Hawk, Tulsa.

Pacific Slope Dairy Show—Exposition under the auspices of the California Dairy Council with co-operation of dairy councils of the Western states and dairy divisions of the agricultural colleges and departments of the Pacific Coast states, Oakland, Cal., December 10 to 16 inclusive. Secretary-manager, Sam H. Greene, 216 Pine St., San Francisco.

Pacific Ice Cream Manufacturers' Association—Annual convention, Oakland, Cal., December 10, 11 and 12. Secretary, Bert H. Walker, Tacoma, Wash.

California & Southwestern States Ice Cream Manufacturers' Association—Annual convention, Oakland, December 10, 11 and 12. Secretary, Jay Kugler, San Francisco.

Supply Men of the Pacific Coast Ice Cream Manufacturers' Association—Exhibition in connection with joint convention of Pacific Northwest, Pacific Coast and Southwestern States, City Auditorium, Oakland, Cal., December 10, 11 and 12.

Georgia Ice Cream Manufacturers' Association—Annual Convention, Augusta, Ga., December 2, 1924. Convention headquarters, Richmond Hotel. Secretary, Sam Marshall, Marshall Ice Cream Co., Albany, Ga.

Arkansas Ice Cream Manufacturers' Association—Annual Convention, Little Rock, some time in December, 1924. Convention headquarters, Hotel Marion. Secretary, Charles Hoober, Pine Bluff.

North Carolina Ice Cream Manufacturers' Association—Seventh Annual Convention, Charlotte, January 13-14, 1925. Secretary, A. E. Dixon, Fayetteville.

Stable Ice Cream Conditions Indicated by Industrial Survey

Manufacturers Discuss Wholesale and Retail Prices, Servicing Practices, Iceless Cabinets and Butterfat and Total Solids Content, in Sweeping Quizz Conducted by The Ice Cream Review

A SURVEY of the ice cream industry on the eve of the 1924 campaign indicates a fixed general opinion that a prosperous year for the industry is at hand. That is reflected by a searching inquiry into prices and policies made by The Ice Cream Review. Although it seems that wholesale prices will not be materially higher than last year's, the inquiry reveals increased interest in quality production.

All the reports had not been tabulated when this issue was going to press, but little progress was indicated for the hope to push off the burden of buying the iceless cabinet upon the retail dealer. Out of 45 manufacturers handling iceless cabinets, only 17 reported that some of their dealers owned the cabinets outright. Out of the 28 manufacturers owning their iceless cabinets, 17 reported that they do not make any allowance for not having to service the cabinet. One reported that the dealer paid rental. Six allow 10 cents a gallon discount, one five cents a gallon, one seven cents, one 20 cents and one allows power charges.

Five of the manufacturers whose dealers own their cabinets outright reported that they allow a discount of 10 cents a gallon, one 17 cents, one 15 cents and one five cents.

Eighty-eight manufacturers who reported that they are not using iceless cabinets at all had various answers for queries on service charges. Seventy-four manufacturers do not ice, 27 have included icing charges in their regular wholesale price, eight charge 10 cents a gallon for icing, one 25 cents a gallon, three 17 cents a gallon, two 20 cents a gallon, two "20 cents daily," two \$1.25 a hole a week, four ranging from \$1.00 to \$1.15 a week, one \$1.00 for every 50 pounds of ice, and one cent a pound for ice and salt, and one \$2.00 a week to dealers using less than 400 gallons a season.

In discussing the query on iceless cabinets, a Kansas manufacturer said, "To make sure the dealer owns them—no allowance."

THE average wholesale price of three Alabama manufacturers is \$1.15, which is the same for eleven manufacturers reporting from Colorado and one from Arizona, while nine manufacturers of Texas struck an average one cent higher. Seven Illinois manufacturers get an average wholesale delivery price of 1.02, five in Indiana the same, five in Kansas \$1.00, four in Michigan \$1.18, three in Mississippi \$1.23, four in Minnesota 95 cents, five in Missouri \$1.00, three in Montana \$1.17, three in New York State \$1.35, three in North Carolina \$1.13, six in North Dakota \$1.00, eleven in Ohio \$1.18, five in Pennsylvania \$1.40, eight in Wisconsin \$1.06, four in Washington \$1.05, three in West Virginia \$1.35, three in Virginia \$1.05.

Following are average prices of manufacturers reporting on prices for ice cream shipped by express:

Alabama \$1.00, Colorado \$1.05, Washington, D. C. \$1.35, Georgia \$1.15, Illinois 98 cents, Indiana 97 cents, Iowa \$1.00, Kansas 97 cents, Kentucky 90 cents, Maine \$1.30, Maryland \$1.20, Massachusetts \$1.25, Michigan \$1.03, Minnesota 90 cents, Mississippi \$1.18, Missouri 90 cents, Montana \$1.07, Nebraska \$1.05, Nevada \$1.15, New Mexico \$1.20, New York State \$1.35, North Carolina \$1.00, North Dakota \$1.00, Ohio \$1.06, Oklahoma 90 cents, Oregon \$1.00, Pennsylvania \$1.27, South Dakota \$1.00, Tennessee 95 cents, Texas \$1.08, Utah \$1.25, Virginia \$1.05, Washington \$1.05, West Virginia \$1.30, Wisconsin \$1.04, Wyoming \$1.20.

NEVADA seems to head the list in the retail price of brick ice cream, with a price of 85 cents a quart. Hard by is Kentucky, with a price of 75 cents, and then Wyoming, 70 cents.

Replies indicate the following retail prices, approximately, for brick ice cream per quart in different states:

Alabama 60 cents, Arizona 75 cents, Colorado 60 cents, Washington, D. C. 75 cents, Illinois 54 cents, Indiana 51 cents, Missouri 50 cents, Montana 60 cents, Nebraska 50 to 55 cents, New Mexico 60 cents, New York 75 cents, North Carolina 50 to 60 cents, North Dakota 50 to 60 cents, Ohio 50 to 60 cents, Oklahoma 50 cents, Oregon 60 cents, Pennsylvania 60 cents, South Carolina 50 cents, Tennessee 60 cents, Texas 50 to 60 cents, Utah 70 cents, Virginia 60 cents, Washington 50 to 65 cents, West Virginia 60 cents, Wisconsin 50 to 60 cents.

THE retail prices of brick per pint for different states are approximately as follows, according to tabulations from the reports:

Alabama 35 cents, Arizona 40 cents, Colorado 30 cents, Washington, D. C., 35 cents, Georgia 30 cents, Illinois 30 cents, Indiana 25 and 30 cents, Iowa 35 and 40 cents, Kansas 30 and 35 cents, Maine 30 cents, Maryland 30 cents, Massachusetts 35 cents, Michigan 30 cents, Minnesota 25 and 30 cents, Mississippi 30 and 35 cents, Missouri 25 and 30 cents, Montana 30 cents, Nebraska 25 and 30 cents, New Mexico 35 cents, New York State 35 and 40 cents, North Carolina 30 and 35 cents, North Dakota 25 and 30 cents, Ohio 30 cents, Oklahoma 25 cents, Pennsylvania 30 cents, South Dakota 35 cents, Tennessee 30 and 35 cents, Texas 30 cents, Utah 40 cents, Virginia 30 cents, Washington 25 and 30 cents, West Virginia 30 and 35 cents, Wisconsin 25 and 30 cents, Wyoming 40 cents.

Following are average retail prices per bulk quart for different states:

This is the season to sell profit~ making **Mapleine** ice cream

WITH good vanilla almost double its normal price, it will pay manufacturers this year to get behind those flavors which meet the public's fancy and at the same time pay a good profit.

MAPLEINE

Is such a flavor. It is so well liked that each year practically all producers experience a big gain in its demand. With many, Mapleine Ice Cream sells in a class with two staples — strawberry and chocolate.

And it is much more profitable. Mapleine flavors a gallon of ice cream for 1½ c. This makes it worth your while to push it in place of more expensive flavors.

Mapleine is a vegetable flavoring, containing no ethers to change flavor in freezing and storing. It is so concentrated that 2 ounces flavor and color 10 gallons of finished ice cream.

Test Mapleine to your satisfaction. Order of your supply house or write us. We guarantee good results.

Wyoming	1.20	1.20	.70	.40	.58	.20	14	10	36

Figures given here are averaged from reports of manufacturers in a recent trade survey by The Ice Cream Review.

New York 70 cents, North Carolina 55 and 60 cents, North Dakota 50 and 55 cents, Ohio 50 and 55 cents, Oklahoma 50 cents, Oregon 60 cents, Pennsylvania 55 cents, South Dakota 50 cents, Tennessee 50 cents, Texas 55 cents, Utah 50 cents, Virginia 60 cents, Washington 45 and 50 cents, West Virginia 55 cents, Wisconsin 50 cents, Wyoming 60 cents.

Following are average retail prices per bulk pint:

Alabama 30 cents, Arizona 30 cents, Colorado 25 to 30 cents, Washington, D. C., 30 cents, Georgia 35 cents, Illinois 30 cents, Indiana 25 cents, Kansas 25 and 30 cents, Kentucky 25 cents, Maine 30 cents, Maryland 30 cents, Massachusetts 30 and 35 cents, Michigan 30 cents, Minnesota 25 and 30 cents, Mississippi 25 and 30 cents, Missouri 25 and 30 cents, Montana 25 and 30 cents, Nebraska 25 cents, New Mexico 35 cents, North Carolina 30 cents, North Dakota 25 and 30 cents, Ohio 25 and 30 cents, Oklahoma 25 cents, Oregon 30 cents, Pennsylvania 25 and 30 cents, South Dakota 30 cents, Tennessee 30 cents, Texas 25 and 30 cents, Utah 30 cents, Virginia 30 cents, Washington 25 and 30 cents, West Virginia 30 cents, Wisconsin 25 cents, Wyoming 25 and 30 cents.

THE average percentage of butterfat content maintained in different states, as indicated by reports, follows:

Alabama 11 per cent, Arizona 11 per cent, Colorado 12 per cent, Washington, D. C., 12 per cent, Georgia 13

cent, Texas 11 per cent, Utah 14 per cent, Virginia 11 per cent, Washington 12 per cent, West Virginia 12 per cent, Wisconsin 13 per cent, Wyoming 14 per cent.

The average percentage of total solids follows:

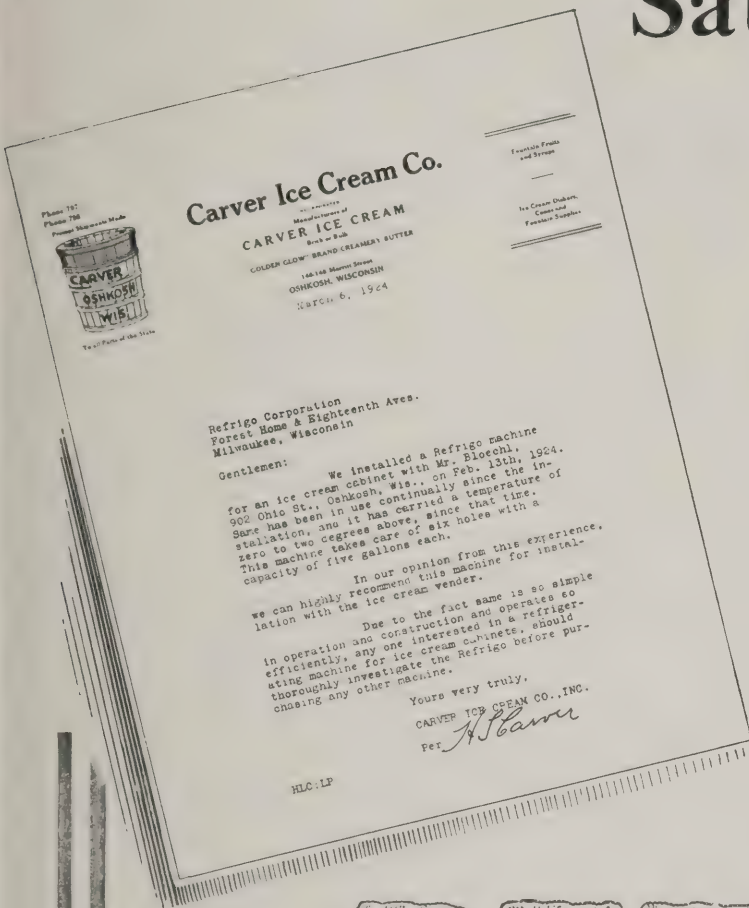

Alabama 34 per cent, Arizona 35 per cent, Colorado 33 per cent, Washington, D. C., 37 per cent, Georgia 35 per cent, Illinois 35 per cent, Indiana 35 per cent, Kansas 34 per cent, Kentucky 34 per cent, Maryland 38 per cent, Massachusetts 37 per cent, Michigan 34 per cent, Minnesota 37 per cent, Mississippi 36 per cent, Missouri 34 per cent, Montana 37 per cent, North Carolina 36 per cent, North Dakota 35 per cent, Oklahoma 34 per cent, Ohio 37 per cent, Oregon 36 per cent, Pennsylvania 37 per cent, South Carolina 34 per cent, Tennessee 33 per cent, Texas 36 per cent, Utah 36 per cent, Virginia 34 per cent, Washington 34 per cent, Wisconsin 33 per cent, and Wyoming 36 per cent.

MORE TRADE REPORTS NEXT MONTH.

Further reports in The Ice Cream Review's recent sweeping industrial survey will be published in the July issue of The Ice Cream Review. Some of the reports had not been tabulated when this issue was going to press.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Practical Tests Result in Satisfied Users

Only through actual installations do ice cream manufacturers realize the big benefit of mechanically refrigerated ice cream cabinets. The saving in ice, salt and time becomes a reality. The cost of operation, a practical demonstration of economy and the quality of product maintained an asset to every ice cream manufacturer.

REFRIGO for the Ice Cream Cabinet

REFRIGO for the ice cream cabinet is the ideal machine. Its silence in operation is a pronounced feature essential to its success in the establishments of dealers of distinction. Its patented leak-proof seal, preventing escape of ammonia gas is another feature that places Refrigo foremost in this field. Capacity equals 200 pounds of ice per day. A $\frac{1}{4}$ H. P. motor does all the work and an automatic temperature control conserves the use of power.

EVERY MANUFACTURER IN DIXIE SHOULD BE A MEMBER OF THE SOUTHERN ASSOCIATION.

Why Ice Cream is Not Competing with Soft Drinks

The Dealer is in League Against the Ice Cream Man as Shown by Figures Revealing that One City Spent Ten Million Dollars for Soft Drinks.

Beverage People Get Their Goods Before the Public's Eyes

ONE can readily understand possibilities for the development of ice cream consumption, not only in the South but in the entire nation, when it is understood that in one Southern city alone, Atlanta, ten million dollars was spent for soft drinks in 1922. This was an average of \$40 for every inhabitant in the city limits. This amounted to 324 drinks per person during the entire year, Atlanta consuming seven gallons of syrup per capita.

Three hundred twenty-four drinks a person. This is almost an average of one drink a day. Now, what if we could get the public to carry out the ice cream manufacturers' advice to "eat a plate of ice cream every day" for health and satisfaction?

As the soft drink industry continues to outstrip the ice cream industry in advancement, we are reminded that there is a peculiar psychology to the situation. The peculiar appeal of soft drinks to public popularity is hard to arrive at, but it is only fair to say that soft drinks—bottled and soda fountain beverages—have a claim to rank as a food product. People familiar with the ice cream industry, however, realize that the carbonated beverage is not the same wholesome product as ice cream—there is a vast difference.

What is the difference? It is hard to face the truth some times, but in this case it must be admitted by all that the soft drink industry has advanced because the people behind it did not wait to feel their way and question whether the people would like this or that, or whether it would be advisable to try to sell the people soft drinks in the winter time; they went ahead and acted! They have sold their products.

You must take off your hats to the soft drink people, however much they may be a thorn in the ice cream man's side. Nothing is to be gained by cussing this competition, for the soft drink people have just as much right to go after the public's dollars as we. The point is, they are doing just that—going after the dollars. Incidentally, they are getting them—the dollars. A nickel a shot is the way the soft drink goes, but there are lots of shots and accordingly lots of nickels.

IT IS easy to understand why one Southern city averaged more than one drink of soda water every day in the year, not counting Sundays. Atlanta is the soft drink capital of the country. The largest soda water bottling plant in the world is located in Atlanta. Some of the largest bottling supply houses in the world operate from Atlanta, either having headquarters there or large

district agencies. One particular soft drink has had sensational popularity in that section for many years. In late years it has been sold extensively in other sections of the country. There are men and women, boys and girls, white and black, who would not think of starting off a day's work without first stopping at the soda fountain and calling for this particular drink. This drink is quite an industry of its own, a very large industry indeed. People have called it harmful, have insisted that it causes wakefulness, hurtful stimulation, etc., but the popularity of the drink has not waned one iota.

To the credit of this exceedingly popular drink it must be said that it never has been definitely shown that it causes injury to health. But imagine, gentlemen of the ice cream industry, how many people would be willing to believe the slightest suggestion that ice cream in the main is an unwholesome conglomeration. No one would have to say that ice cream causes wakefulness, unnatural stimulation, or a drug effect; it would only be necessary to hint that a certain man's ice cream has a little too much gelatine, is a little too rich or not quite rich enough, and instantly there would be created a prejudice not only against that ice cream but all ice cream in general.

Even ice cream manufacturers who also distribute bottled drinks would find it hard to explain the condition whereby the bottled beverage is accepted with less questioning than ice cream.

THERE is one reason, however, for the greater popularity of soft drinks that is readily understood. The retail dealers are keeping them before the public's eyes. That is where the greatest difficulty comes in; the ice cream industry's greatest competitors, candy, chewing gum, packaged fruits, etc., are given conspicuous places on the soda fountains and display counters while there is rarely—very rarely, anything concerning ice cream to catch the eye. At best, if anything at all, there is some kind of picture of an ice cream sundae or an ice cream cone, sometimes more or less tattered and torn at that.

When a man enters a soda fountain, the bottled beverage immediately has all the advantage if that man is thinking about something refreshing. He may really want a dish of ice cream, or a cone or sundae, but as he stands around awhile waiting for clerks to pass out glass after glass of soda water, all the time with rows of bottled beverages before him, the chances are more than favorable that he will say, "Aw, just gimme a cold drink, something with lemon or orange in it."

Dixie Flyers Form Exhibition Plans

Winter Garden at New Orleans to be Scene of What is Expected to be
Southern Ice Cream Industry's Greatest
Exhibition. Probably 150 Booths

Southern Convention Session to be Held in Same Building

THE Winter Garden, located one block from the DeSota Hotel, the headquarters of the Southern Association of Ice Cream Manufacturers, has been selected as the scene of the exposition to be staged by The Dixie Flyers in connection with the annual convention of the Southern association, to be held in New Orleans, November 14 and 15. This is expected to be the South's greatest ice cream event.

HARRY A. BENNERS.

The decision of the Dixie Flyers to hold an exhibition came at the request of officials of the Southern association, which will close its convention before the opening of the national convention in New Orleans the following week, but most of the members of the Southern association will remain for the national convention. The Dixie Flyers will not exhibit in connection with the national convention, and since The Association of Ice Cream Supply Men has decided to hold no exposition this year, the National Association of Ice Cream Manufacturers will meet without an

exposition for the first time since 1921.

Arrangements have been made to hold the business sessions of the Southern association in the exhibit hall, according to Harry A. Benners, president of the Dixie Flyers and head of the Southern Sales Corporation, with headquarters in the United Fruit Building, New Orleans, La. He reports that a number of supply houses already have made application for space, "as they realize the importance of displaying their products at this convention," which promises to be the largest ever held in the South. Applications for space should be made immediately to P. N. Miller, Jr., secretary of the Dixie Flyers, Box 1830, Birmingham, Ala., or to H. A. Benners, president, 605 United Fruit Building, New Orleans.

HAVING recently completed a tour of the Southern territory, President Benners declares that the ice cream manufacturers of Dixie, "have expressed themselves to a man that it is their intention to attend the convention in full force."

The Winter Garden will afford the Dixie Flyers space for about 100 to 150 booths, this depending largely upon the amount of space to be allotted for the Southern convention sessions. The size of the space will be either 8 by 8, or 10 by 10 feet, and will not cost more than \$35.00, the president says. He stresses the importance of early reservation by all supply houses.

It is felt sure that supply houses will be quick to seize upon this opportunity to exhibit at New Orleans this year. The decision of the Association of Ice Cream Supply Men not to hold an exposition caused keen disappointment throughout the Southern ice cream industry, according to Mr. Benners, who says his tour disclosed that manufacturers of Dixie are unanimous in favor of an exhibition.

IN VIEW of the conditions surrounding the New Orleans gathering, President Benners believes the Dixie Flyers' exhibit will be the most spectacular.

Officials of the Southern Association of Ice Cream Manufacturers have expressed the belief that their 1921 convention will be the most largely attended on record. The association is laying extensive plans, both in the interest of its own convention and toward the success of the national convention, and although all plans are only of a tentative nature at this time, assurance is given that the trip to New Orleans will be one of the most enjoyable that ice cream manufacturers in any section ever took in connection with a convention.

New Orleans calls itself "America's most interesting city," and many manufacturers no doubt will find the convention city an irresistible magnet.

Secretary N. Loewenstein of the National Association of Ice Cream Manufacturers is of the opinion that his association will have a largely attended convention. Reports to him indicate very wide interest.

TEXAS MANUFACTURER PASSES AWAY.

The Ice Cream Review has received announcement of the death early last month of J. A. Smith of the Boedeker Ice Cream Co., Dallas, Tex. Mr. Smith, who had been connected with the firm since its organization forty years ago, passed away at his home in Dallas. He was secretary-treasurer of the firm and was widely known in the Southern trade. His death is a source of profound regret for friends in that territory.

The Boedeker Ice Cream Co. is one of the oldest ice cream manufacturing establishments in the South. Mr. Smith joined with the late George L. Boedeker, Sr., in the enterprise. The new plant of the Boedeker Company was their life-long dream. It was completed three years ago, just before the death of the elder Boedeker. The plant now is under the active management of George L. Boedeker, Jr.

ALABAMA FIRM IN NEW HOME.

The new home of the Huntsville Ice Cream and Creamery Co., Huntsville, Ala., on West Clinton street, is now in full operation. J. C. Beane, manager of the plant, reports a steady increase in business and announces that the machinery for buttermaking is being run full time.

Mr. Beane reports that the latest type machinery has been added to take care of the increase in business. Of course the ice cream business is rapidly increasing just now, but the company reports that its modern machinery enables it to fill orders promptly.

Wisconsin Dairy Interests Lay Plans for World's Greatest Dairy Show

National Dairy Club of Wisconsin Organized to Prepare for Mighty Gathering at 1924 Exposition

ON WISCONSIN—to Dairy Show victory! That was the battle-cry raised at a luncheon-conference at the Republican House, Milwaukee, Thursday, May 15, when dairy interests of the Cream City and others identified with preparations for the National Dairy Exposition formally laid aside their knives and forks, rolled up their sleeves and went to work on the biggest job that ever faced a dairy organization.

The meeting was in the nature of a follow-up to other sessions that had been held in connection with the coming exposition. The National Dairy Club of Wisconsin was formally organized. This step marked the first move toward the building up of committee machinery to iron out all kinks and open the way for the coming of the greatest event ever held in dairymen.

The club will meet every two weeks, every other Thursday. Each meeting will find the members of the club gathered over bread-and-butter dishes to talk over plans in connection with the National Dairy Exposition, which everybody knows will take place in Milwaukee September 27 to October 4, 1924.

This club, which is one of five recently organized at different points in the country in connection with the activities of the National Dairy Association, will be the medium through which Wisconsin dairy interests will work toward getting "America's Dairy Capital" in readiness to do itself proud when the day of dairy glory dawns next September.

Outstanding impressions gathered at the meeting on May 15 were:

The 1924 National Dairy Exposition will be the most representative gathering of the dairy clans ever held, far surpassing anything ever before dreamed of insofar as concerns all section of the country and all arms, branches and divisions of the dairy industry.

The 1924 National Dairy Exposition will be truly an all-American, all-dairying affair.

Milwaukee faces the opportunity to be the permanent home of the National Dairy Show.

Milwaukee faces the task of making arrangements for receiving and taking care of the greatest avalanche of dairy delegates that ever moved on any city.

Wisconsin's highly developed science of dairying will be one of the mighty magnets to draw visitors from North, East, South and West to study dairying possibilities in all sections.

The 1924 National Dairy Exposition will draw the largest attendance of ice cream manufacturers of any past event of this character.

The fullest possible strength of the dairy industry of Wisconsin is required behind the efforts of the National Dairy Club of Wisconsin to make arrangements for the coming dairy classic.

Different speakers pointed out that the biggest task facing dairy interests of the Badger state is developing a conception of the magnitude of the undertaking in their hands. The spirit shown at the luncheon was evidence sufficient that the Badger state is fully alive to the work ahead of them. Members were asking for work—and were finding it.

WIDESPREAD sectional interest in the show was indicated in a stirring speech by W. E. Skinner, secretary of the National Dairy Association and honor guest at the conference. Mr. Skinner said letters have been received stating that special trains will be run from Omaha under the auspices of bankers of Nebraska, from Knoxville, Tenn., under the auspices of bankers of that state and from other cities in different parts of the country.

The 1924 show will find the Southern states more interested in this event than ever before has been the case. There are two explanations. In the first place, the dairying urge is stronger in the South now than ever before. And, too, the South wants to study Wisconsin's system of dairying.

This is also true in other sections of the country where dairying has lately taken firm root.

The luncheon served immediately to dispel any impression that might have existed that the 1924 show would be a Milwaukee, and Wisconsin proposition. The principal job facing Wisconsin and its metropolis is the matter of playing hosts to visitors from far and wide.

Wisconsin's dairy industry will be on parade. Prospective delegates are regarding Wisconsin as being as much a part of the show as any of the high-producers, machinery and equipment to be exhibited. The story has gone to remote corners that Wisconsin has builded an empire of dairy prosperity.

IT WAS no less an authority than W. E. Skinner, that wise and campaign-scarred veteran of National Dairy Association activities, who pointed out that the nation-at-large wants to see what the world's greatest dairying state has done.

(Continued on page 155)

An All-American Dairy Show

THE 1924 Dairy Show will be an all-American, all-dairying exposition. By this is meant it will be for every branch of dairying and dairy manufacturing and for dairymen of every section of the country. It will be the most representative Dairy Show yet held. This was brought out at a dairy meeting in Chicago recently. It was echoed at a meeting in Milwaukee May 15, when the National Dairy Club of Wisconsin was organized.

Wisconsin is now going forward with plans for its great army of visitors next fall.

Every man engaged in dairying, no matter where or in what capacity, will find that the Dairy Show will fully cover his end of the business.

Here is the schedule for dairy plant operators:

Monday, September 29—Milk Dealers' Day.

Tuesday, September 30—Creamerymen's Day.

Wednesday, October 1—Cheesemakers' Day.

Thursday, October 2—Ice Cream Day.

Friday, October 3—Evaporated and Powdered Milk Day.

EVERY DAY — DAIRYMEN'S DAY

WIN THE TRADE WITH TASTIER ICE CREAM

Every ice cream manufacturer knows how to make a good, wholesome product—the deciding factor in winning the trade is FLAVOR. Insure public preference for your ice cream by using

BOWEY BRAND

SUPERFINE

Bulk Fruits and Flavors

Especially prepared for the ICE CREAM MANUFACTURER

For more than a quarter of a century we have served many of the leading Ice Cream Makers with the following Bowey Brand Products:—

Van Cou Concentrate

The Wonder Vanilla Flavoring Concentrate, containing 62½% of pure vanilla. Will not freeze out and costs less than 1 cent a gallon ice cream.

Special Dark Dutch Process Cocoa

For Prize Winning Chocolate Ice Cream — the richest and best — at a cost of only 5c a gallon for the flavor. Make this one of your leaders.

Compound Caramel Flavor

Imparts that natural cooked cream flavor everybody loves! A gallon at \$5.50 (net) will flavor 320 gallons of finished ice cream, costing only 1¾c a gallon.

Orange and Lemon Creme Flavors

For refreshing Water Ices, Frappes, Sherbets, etc. Made from whole selected fruits—\$7.00 and \$6.00 a gallon, respectively.

Jeline (Ice Cream) Powder

The wonderful emulsifier, used instead of gelatine by many of the leading ice cream makers, because it is better, more convenient and economical.

Bowey Brand Fruits and Flavors are of the highest quality. They will impart to your product that delightful freshness of flavor that defies imitation. Place sample order today.

Ice Cream Industry In Tokyo

Olden Prejudices Have Handicapped Development of Industry

By E. G. BABBITT

THE ice cream industry in Tokyo is still in its infancy. While ice cream, sherbet and the like have been served for many years in the purely foreign style hotels and in the homes of foreign residents, these frozen confections were practically unknown to the Japanese ten years ago, and it was only about 1912 that any attempt was made to popularize the soda fountain idea among the foreign residents of Yokohama.

The growth of this business in the foreign settlement was very slow, having to overcome many prejudices against what was commonly known as an American habit; ice cream and ice cream sodas. The Japanese appear to have been satisfied with their "korimizu" (literally ice water), usually peddled from carts, and consisting of ice shaved with a common plane into a glass, and flavored with bean syrup or other sweet syrups. This is still popular in the hot weather, as the Japanese are not partial to rich ice creams, preferring the ices of sherbet type.

Such ice cream as was made was produced in small hand-turned freezers in the homes and hotels. It was not until about three years ago that the manufacture of ice cream in quantity, by mechanical means, was introduced. Before September 1, 1923, there were several companies operating with machinery, but most of them were put out of business by the fire, and the changed conditions of the city and inhabitants. There are about 3,000 eating places, including hotels, in the city, serving foreign dishes in varying extent, and it is reported that

about 80 per cent of these make for themselves such ice cream as they require.

THERE are several concerns manufacturing ice cream for wholesale distribution. This district produces considerable quantities of milk and the manufacturers find it more profitable to make and ship the ice cream to Tokyo rather than shipping the milk. They have also a fair local demand. From time to time other manufacturers have entered the field, as will probably be the case with the commencement of warm weather this year, but none has made any particular success.

The foregoing refer to companies manufacturing for retailers; there are a great number of establishments which prepare their own ice cream. They sell considerable ice cream in their own retail shops and tea rooms, this department for one company being in charge of a Japanese who had been for some years in America and gained a thorough knowledge of the business.

One drug store has a very popular lunch counter, where ice cream and sodas are dispensed under the direction of a Japanese who learned the business in Los Angeles. This man is experimenting with the idea of producing an ice cream which will meet with popular approval among the Japanese, who are not accustomed to the use of milk and do not care for rich ice cream.

Fresh milk and cream form the base of most of the ice cream manufactured, but considerable adulteration is reported in some of the cheaper establishments. The Food Inspector of the Metropolitan Police Board, Tokyo, states that no regulations governing the manufacture of ice cream have been issued by the Department of Home Affairs, and consequently there is much variation in methods of preparation. Cornstarch, gelatine and ice cream powders are used to some extent; also eggs. The best is made of fresh milk and cream, with imported flavors, though some flavoring is produced in Japan of native fruits and berries.

The retail price runs from 5 to 40 sen per plate or glass, with higher prices prevailing for fancy sundaes or combinations; the best, however, not selling under 40 sen per plate.

NO OFFICIAL figures are available covering the consumption of ice cream in Tokyo, the records of the Food Inspection Bureau having been destroyed. Unofficial estimates have been supplied. According to these unofficial estimates there are some 4,000 retail establishments in Tokyo using from four to six gallons of ice cream daily, with a total yearly consumption of 6,570,000 gallons (which seems high). The larger restaurants use electric power in the manufacture of ice cream, some hotels use the ammonia process, but the smaller suppliers employ hand-turned freezers.

The wholesale price of ice cream last year was from Yen 12. to Yen 13. per 100 plates, for ordinary quality, or per 4 sho (one sho being equivalent to 1,588 quarts).

There is a sale for ice cream throughout the year in Tokyo, and an increasing demand during the hot weather. It is likely that regulations will be issued governing its manufacture, to guard against impurities, artificial coloring and the like, so that with a standardized product there is possible the manufacture of ice cream on a larger scale than heretofore will be attempted.

SUPPLY MEN SPREAD THE STORY OF THE NATIONAL ASSOCIATION.

Hundreds of Salesmen Posted on Accomplishments of Ice Cream Manufacturers' Organization.

The Association of Ice Cream Supply Men has placed in the hands of all members of its affiliated Salesmen's Club a "True Story of National Association Benefits" pertaining to the work of the National Association of Ice Cream Manufacturers and its value to all ice cream men.

The hundreds of members of the Salesmen's Club are prepared to acquaint interested ice cream manufacturers who may not have availed themselves of participation in the national association work, with a resume of the latter organization's activities. The "True Story of the National Association" in part follows.

Generally:—1. The national association is promoting three kinds of things:

- A—Progress in the ice cream industry.
- B—Harmony in the ice cream industry.
- C—Protection for the ice cream industry.

1. The national association is advertising over the whole country for a permanent slogan for ice cream. See the attached proof of one of these ads.

2. The national association is preparing to advertise not merely for a slogan but to advertise ice cream itself—least to enable ice cream manufacturers to standardize, simplify and economize in an individual participation in a national advertising campaign.

3. The national association has spent much money and the time of many gifted men in analyzing accounting problems of the ice cream business. Its uniform cost accounting data can save an ice cream man—no matter how he is—untold confusion and increase his profits.

4. The national association is protecting the whole industry against unjust standards. It employs able attorneys; its officers themselves go to Washington; it fights the battle of the whole great industry.

5. The national association protects the industry against unfair express rates. Its officers and committee men fight many a battle before committees, with express company officials and before regulatory commissions.

6. It does a lot of other things. It is interested in standardization of equipment. Through it ice cream men can have a voice in the Chamber of Commerce of the United States. Its conventions are incalculable in their educational value. Its vigilance committee smooths out sore spots in the industry and helps keep the advertising of supplies on a proper level. It saved the ice cream industry during the war by winning classification as an essential industry and so ensuring a sugar supply. It posts its members on tax questions and other business matters. It has an industrial laboratory fund.

7. If it were not for the national association there would be today no ice cream industry of the scope and we know and unless the national association continues to grow in the future and comes to include the great majority of ice cream men within its membership, there will be no truly and permanently greater ice cream industry in the future.

TO OPEN ICE CREAM PLANT.

A building was recently purchased by Elbert Garrett at Morrilton, Ark., for an ice cream factory and creamery. Mr. Garrett, who is proprietor of the Purity Ice Cream Company of Russellville, said that work of installing the machinery, which will cost about \$15,000, will be started right away.

"Service Always Counts"

The Five Essential Steps in Ice Cream Making

The Essential Steps Recommending the Attention of the Ice Cream Manufacturer Are
Assembling, Processing, Stabilizing, Freezing and Ripening.
What Do You Know About Them?

By BENJAMIN MASUROVSKY, B. S., M. S.*

THE technical improvements in the manufacturing of ice cream nowadays facilitate to draw sharp border lines between the various processes in ice cream making.

It is of great importance to know the different stages of the game and the connection existing between the various stages as affecting the finished product. This knowledge can only be acquired by an analytical study and in a logical way the different steps involved in making ice cream.

There are five essential steps recommending the attention of the ice cream manufacturer. They are, in order, as follows:

1. Assembling.
2. Processing.
3. Stabilizing.
4. Freezing.
5. Ripening.

I. Assembling, as the term implies, designates the gathering or aggregating of the various ingredients which are to enter the ice cream mix. This step covers the standardization of the mix for butterfat, solids-not-fat and total solids, and apportioning of the various amounts of raw material available for the preparation of the ice cream mix. Here is where consideration should be given to the quality of the milk products as to acidity and flavor, also, the grade of gelatine, sugar, and other non-dairy ingredients to be used in the ice cream mix. At this step the foundation is laid and according to the common saying, "Whatsoever a man soweth that shall he reap," the quality of the foundation stock on hand will affect the quality of the finished product. It is not sound reasoning to depend upon such phenomena as freezing out the odor or flavor because the latter condition is more often "an olfactory illusion."

Although it is true that freezing reduces considerably the volatility of ice cream while in a frozen condition, nevertheless the odor or flavor of the frozen product reappears on melting due to an increase of volatility at a higher temperature. No matter whether it is a lactic acid flavor or any other objectionable odor of the raw material used in ice cream making it will in-

variably be carried to the frozen delicacy and reduce the quality of the finished product.

Only high grade raw material should be used in building up a high quality ice cream. In other words the first step in successful ice cream making is the selection of good raw material during the process of assembling the ingredients which go to make up the ice cream mix.

II. The second essential step in ice cream making lies in the processing of the ice cream mix. After the desirable proportioning and selection of quality ingredients received proper attention the next step is to combine them in such a manner that all the ingredients are interwoven to a great degree of fineness and are homogeneously incorporated in the mix. This is accomplished by pasteurizing the entire mix at a temperature of 145 degrees F. for 30 minutes, then by passing it through a homogenizer or viscolizer at a pressure of 2000 to 2500 pounds per square inch. In other words, the combined ingredients undergo processing by virtue of which the entire ice cream mix is turned into a complete fine fabric to be used in the making of ice cream. Pasteurization destroys the pathogenic micro-organisms that might be present in the mix and it renders the butterfat globules and milk proteins pliable and easily to be acted upon by either the homogenizer or viscolizer.

III. Just as in the case of building a house care is taken that the foundation is first "set" or stabilized before the structure is placed on it; so it is with an ice cream mix. The assembling and processing of the mix formed the basis for preparing the ice cream mix for the freezing process but before placing the processed mix into the freezer it is good practice to allow the mix to stabilize itself. In other words, the time element must be considered as a prerequisite in obtaining a stable texture while the mix becomes set. This is accomplished in the third step where stabilizing of the mix takes place during aging, i. e., allowing the processed mix to remain undisturbed in the aging room for 24-48 hours at a temperature below 40 degrees F. In one sense aging is a continuation of processing the mix whereby the homogeneously distributed particles of the milk proteins and fat readjust themselves to the new environment.

The lactalbumin, casein, gelatine particles imbibe the

milk serum causing them to swell up. The milk fat is more highly emulsified and are enveloped by the suspended milk proteins, collectively giving rise to higher viscosity and smoother texture of the mix. All in all aging is just as important to a step in stabilizing the mix as homogenization is in the processing of the assembled ingredients of the mix.

IV. With the ice cream mix properly combined and handled the next step is to bring the mix into a partially frozen and sufficiently whipped up cream so that it can be placed in the hardening room for completion. In other words, the well prepared ice cream mix has to undergo a freezing process which produces a not-completely finished product or a "green" frozen article. This stage is reached in two distinct phases: (a) The pre-freezing phase, and (b) the freezing point phase.

A. The temperature of the ice cream mix before drawn into the freezer is ordinarily below 40 degrees F. During agitation and cooling the temperature of the mix is lowered to about 28 degrees F. when attention is given to the whipped up condition of the ice cream mix. This constitutes the pre-freezing phase.

B. From the time the ice cream mix reaches 28 degrees F. until it is ready to pull, the freezing point phase is watched carefully. During this phase the temperature remains practically constant while the whipping condition of the ice cream mix increases rapidly.

THE factors which influence the freezing of the ice cream mix are: (a) Quantity of mix, (b) temperature, (c) speed of the dasher, (d) composition of the mix, (e) treatment of the mix, and (f) the rate of flow of the brine.

(a) Regarding the quantity of mix to be used it is definitely shown that judging by the size of the freezer

amounts representing half the capacity of the freezer or slightly less give best results. At that point the mix exposed to the optimum conditions which facilitate proper agitation and the desirable incorporation of air.

(b) Temperature factors may be considered from two standpoints: 1. From the standpoint of the freezing agent, and 2, from that of the mix. If the circulating brine is too cold (below zero F.) the ice cream will reach a solid condition too soon to allow for the incorporation of enough air to obtain the desired yield. On the other hand, if the brine is too warm (about 12 degrees F.) the time of freezing will be prolonged and the resulting ice cream will become too fluffy or light. The optimum temperature of the freezing agent is ordinarily between 5 and 10 degrees F. above zero.

Desired results could be obtained at lower temperatures if the freezing process is carefully watched. When the brine is around zero or below, it is left on a comparatively short time and after shutting it off the yield may be gotten by further whipping the cream in the freezer. The mix before drawn into the freezer should be precooled to about 40 degrees F. or below because higher temperatures require more time for freezing and if the cream is not homogenized there is danger of churning.

It is practically impossible to bring the ice cream mix below 26 degrees F. and be able to draw it readily from the freezer. If freezing is prolonged to such an extent that the temperature falls below 26 degrees F. then the yield is reduced considerably due to the working out of the air cells from the stiff cream. Ordinarily the optimum temperature to draw the ice cream from the freezer is about 26-27 degrees F.

(c) With the factory constructed freezer the dasher is run at a uniform rate of speed provided there is no slippage in the belt. Therefore, in order to obtain efficient and correct results it is necessary to adjust the temperature of the mix and that of the circulating brine in harmony with the speed of the dasher. For example, if the speed of the dasher is 250 revolutions per minute when the temperature of the incoming brine is zero degree F. and the temperature of the mix is 32 degrees F. it will require about 12 minutes to freeze the batch. In other words, this illustrates the variations which must occur in the several factors concerned when the speed of the dasher is fixed.

(d) The composition of the mix affects the freezing point in the following manner: An increase in the butterfat content will raise the freezing point, while an increase in the other solids-not-fat tends to lower the freezing point.

(e) In the freezing of a homogenized mix it usually requires more time to obtain the proper consistency during freezing than in the case of an ordinary pasteurized cream because the former, as a rule, is more viscous and offers greater resistance towards the incorporation of air although the final temperature is the same as in the latter.

(f) Since the flow of brine through the freezer is fixed the rapidity of freezing is determined by the temperature of the flowing brine; the lower the temperature the less time will be required to freeze the mix at a given rate of flow of brine.

V. The final step in ice cream making consists in hardening or ripening the partially frozen or "green" cream. In other words, hardening is the continuation of the freezing process which converts the semi-frozen product into a more completely frozen condition. The main object of hardening ice cream is to bring about a more firm and solid frozen product. There are three common methods employed in hardening under present methods of ice cream manufacturing: 1. The packing

Leffel Scotch Marine Boilers

BECAUSE they require less room and are more powerful than other boilers of the same size Leffel Self-Contained, Internally Fired, Horizontal Return Tubular, Portable Boilers are highly desirable for use in Creameries, Dairies, Ice Cream Factories—Milk Handling Plants of all kinds.

They are perfectly safe and require little attention and meet requirements of all State boiler laws. Sizes 6 to 100 H.P.

OFFICE CONTROL

TORRID weather. Demand and supply are fighting for supremacy. Only through most careful planning, minute control of the situation, can supply and reputation win out.

You are in the office. How much ice cream mixture is in each tank? How many gallons of milk are in the storage tanks? How much cream, sweet butter or skim milk should be added to standardize the batch.

Yes, these are facts which control the situation; facts for which you now have to telephone and depend on others, or personally get.

The Green Gauge System with office control is so much simpler and quicker. A mercury column on the wall near you rises and falls. It is connected directly with your tanks. You see the column drop from 19,200 to 2,000 and you know that 17,200 pounds of milk—2,000 gallons—have been withdrawn. It is time for an emergency call for more milk. Quick work through the Green Gauge keeps production ahead of demand.

The Green Gauge placed on mixing vats furnishes a simple and accurate means of weighing in the liquid ingredients, and the total batch. It is also a particular advantage on hot-wells in connection with vacuum pans for measuring raw materials, and in determining the amount of water or solids to be added to a given batch in order to obtain the correct test.

Tanks with Green Gauge control in the office

This Green Gauge on the office wall is connected with the storage tanks below

Another use for the Green Gauge is in your pasteurizing department. A Green Gauge, installed on the pasteurizing floor, will warn the operator when his tanks are ready to overflow.

Let us tell you more about the Green Gauge control.

Send for Green Gauge literature.

We are complete outfitters for the dairy industry.

tank method. 2. The dry hardening under still air, and 3, the dry hardening under forced air.

A. In hardening ice cream by "the packing tank method" ice and salt are the freezing agents used in so-called "slush boxes." These boxes are made tight of two-inch planks of heavy construction and are of such a width as to allow for the packing of two or three rows of five-gallon cans which are placed in perforated cylinders so that they may be changed without interference with the freezing mixture. Nearer to the bottom is a drain hole for taking care of the brine at each time of repacking. The proportion of salt to ice is 1:15-18 parts. The following table shows the approximate temperature obtained with different proportions of salt and ice:

Per cent of salt in mixture. Temperature of mixture.

	Degrees F.
0	+32
5	+27
10	+20
15	+11
20	+ 1.5
25	-10

B. The dry hardening under still air is accomplished in the following way. The hardening room is piped with direct expansion ammonia coils in such a way as to form shelves upon which are placed the ice cream cans containing the semi-frozen ice cream. The temperature of the room is reduced due to the removal of heat units as the ammonia expands in the coils.

THIS system is rather slow but once the temperature is reduced to zero F. or below it hardens the ice cream in about 12-18 hours, depending upon the size of the ice cream containers. The hardening room is usually

insulated with cork board in two layers of 4-inch thickness. Before putting up the cork board it should be water-proofed by coating it with hot asphalt and allowing it to harden. The vertical and horizontal joints formed by the cork boards in the first layer should be broken by the cork boards of the second layer to eliminate loss of refrigeration.

C. In the air blast method of hardening the ammonia coils are usually located in a separate compartment directly over the hardening room. By means of a fan or blower the air is forced to circulate from the cooling coils through the room thus keeping the temperature more or less uniform. Due to the more penetrating effect of the moving air hardening is accomplished in less time than by the still air system. There is, however, greater loss of refrigeration in the air blast method of hardening than in the still system, especially when doors are opened frequently, unless the fans are automatically shut off whenever the doors open. It requires from 10 to 12 hours to harden ice cream under the air blast system when the temperature is below zero F.

The hardening or ripening of ice cream is influenced by the following factors: temperature, sugar, and solids-not-fat.

To avoid the formation of large ice crystals it is recommended to place the ice cream immediately after it leaves the freezer into a hardening room of about -15 degrees F. After the ice cream has hardened it is transferred into the regular hardening room with a temperature around zero F. The temperature of the ice cream as it leaves the freezer is usually from 26 to 28 degrees F. If kept at this temperature for an hour or longer, the air will gradually escape and the ice cream becomes coarse and grainy. To overcome this condition necessitates immediate and rapid freezing in the hardening room. The lactose and cane sugar present in the ice cream mix lower the freezing point to a marked degree. If a high percentage of milk solids-not-fat is present in the mix there will also be an increase in the milk sugar. For instance, a mix containing about 11.5 per cent solids-not-fat may have as high as 6 per cent milk sugar besides the addition of the cane sugar. The optimum amount of cane sugar is about 13 to 14 per cent although a higher percentage of sugar may be added for some other reasons demanded by the trade. Care should be taken that the milk solids-not-fat are not high in the content of milk sugar. The latter can be accomplished by selecting the dairy ingredients of a low milk sugar content and using a minimum amount of milk solids-not-fat in the preparation of the mix.

Since the hardening or ripening of ice cream puts the finishing touches on the frozen delicacy it will pay to have the best facilities for hardening the ice cream. Of course, it is important to carry out all the five essential steps in ice cream manufacturing under optimum conditions because there is close connection between each preceding and following step involved in the making of good ice cream.

Excel in your methods of manufacturing ice cream and you will turn out a product of p-a-r-e-x-c-e-l-l-e-n-c-e.

CAROLINA ASSOCIATION GROWING.

A. E. Dixon, secretary of the North Carolina Ice Cream Manufacturers' Association, has announced a new member to the association. The new member is the Mecklenburg Dairy Co. of Charlotte. This makes 63 members in all for the North Carolina association. Every year since the association has been formed, there has been a large increase in membership.

The Nafis Standard Ice Cream Color Rods

are practical, inexpensive, color standards that will help you make more money if you use them to maintain uniform colors of your ice cream.

Made for the three most popular flavors: Vanilla (including egg ice creams), Strawberry and Chocolate. Each rod contains four shades for one flavor.

Buy through your jobbers. If they do not stock NAFIS GLASSWARE, write for a circular on NAFIS ICE CREAM COLOR RODS and the names of our distributors in your territory.

An Arithmetical Method of Balancing the Serum Solids in the Ice Cream Mix

By HOWARD E. DOTY*

THIS method is exact and rapid. Factors have been calculated as explained below for each of the products in general use to raise the serum solids in ice cream. To the known ingredients sugar, gelatine and fat, is added sufficient skim milk to make 100 pounds; as problem I-A, II-A, III-A, IV-A, and VI-A. The serum solids content of the skim milk is then calculated and subtracted from the per cent (pounds per hundred) serum solids desired. The difference might be termed a shortage or deficit. This shortage must be made up by adding skim milk powder or other substance high in serum solids and subtracting from the skim milk until the proper proportion of serum solids has been obtained. By dividing this shortage by the factors given, the amount of skim milk powder or other concentrate required to balance the serum solids is immediately determined. When the skim milk powder or other concentrate is added an equal amount must be subtracted from the skim milk to keep the total weight of the mix at 100 pounds. This is explained and proved in the B part of problems I, II, III, IV, V and VI.

Problem I.

Mixes Using Skim Milk Powder.
Factor for Skim Milk Powder.

Starting with skim milk powder, use the factor .861. (The fat, sugar, and gelatine requirements are added, and subtract-

Canvas Products Corporation
FOND DU LAC WISCONSIN

ed from 100, which will leave the number of pounds of skim milk and skim milk powder necessary to complete the mix. The factor is simply the difference that each pound of powder will make in the serum solids.

Since the fat, sugar, and gelatine are fixed quantities, any change in the skim milk powder will cause an equal inverse change in the amount of skim milk. One pound of skim milk powder will add .95 of a pound of solids, but, at the same time will replace one pound of skim milk. One pound of skim milk contains 8.9 per cent, or .089 pounds of solids, so one pound of powder will change the serum solids .95 — .089 or .861. The following problems will illustrate the method of application:

Problem I-A.

100 lb. Mix, 11% Fat, 11% Serum Solids, 13% Sugar and .4% Gelatine. Using Cream, Skim Milk and Skim Milk Powder.

To Determine the Amount of Skim Milk Powder Required.

The known ingredients, sugar, gelatine and fat, are totaled and sufficient skim milk added to complete the 100 pounds. Calculate the serum solids in skim milk and subtract from eleven the pounds desired and find the deficit.

Total solids are not calculated as they are not essential and might be confusing.

13.00 lbs. sugar	Fat 11.00 lbs.	S. S. 11.00 lbs.
.40 lbs. gelatine		
11.00 lbs. fat		
75.60 lbs. skim milk $\times 8.9\%$		6.7284

100.00 lbs.	11.00	4.2716
-------------	-------	--------

A one hundred pound mix minus 24.4 lbs. sugar, fat, and gelatine leaves 75.6 lbs. skim milk necessary to complete the hundred pounds. 75.6 lbs. skim milk $\times 8.9\% = 6.7284$ lbs. serum solids, which leaves between 11 and 6.7284, a shortage of 4.2716 lbs. of serum solids. Using the factor .861: $4.2716 \div .861 = 4.96$ lbs. of powder to be added to bring the solids up to eleven. Thus:

13.00 lbs. sugar	S. S.
.40 lbs. gelatine	
11.00 lbs. fat	
4.96 lbs. skim milk powder	4.712
70.64 lbs. skim milk	6.2869
100.00 lbs.	10.9989

Problem I-B.

Complete and Prove Mix
(Use 30% Cream and Skim Milk.)

The test of cream, of course, will not influence the serum solids. The fat may be in the form of whole milk and cream as well as skim milk and cream. Since the total in any case will be 11 pounds of fat and 70.64 pounds of skim milk. In practice we would weigh instead of 4.96 pounds, 5 pounds of powder and 70.6 pounds of skim milk.

44.94 lbs. skim milk		4.00966
100.00 lb. Mix	10.998	11.04340

Problem I-C.

Use Cream and 4% Milk.
Complete and Prove Mix.

Thirteen pounds sugar, .4 pound gelatine and 4.96 pounds powder, total 18.36 pounds. 18.36 pounds subtracted from 100 pounds leaves 81.64 pounds of cream and whole milk. This 81.64 pounds must contain 11 pounds of fat. Divide eleven by 81.64 and find that the 81.64 must test 13.46%.

Use the Square Method with 13.46 in the center of square.
29.70 lbs. of 30% cream and 51.93 lbs. of 4% milk are required to make 81.64 lbs. of 13.46% cream containing 11 pounds fat.

30	Cream	9.46
	13.46	
4	Milk	16.54
		26.00

$$81.64 \div 26 = 3.14$$

$$9.46 \times 3.14 = 29.7044 \times 30\% = 8.911 \text{ lbs. fat}$$

$$16.54 \times 3.14 = 51.9356 \times 4\% = 2.077 \text{ lbs. fat}$$

100.00 lb. Mix	Fat 11.00 lbs.	S. S. 11.00 lbs.
13.00 lbs. sugar		
.40 lbs. gelatine		
4.96 lbs. powder		4.712
51.9356 lbs. 4% milk	2.077	4.4373
29.7044 lbs. 30% cream	8.911	1.8496
100.00 lb. Mix	10.988	10.9989

The following mixes will not be completed with whole milk and cream. This mix will show the method and is easily applied to each of the following mixes:

Problem II.

100 lb. Mix, 11% Fat, 11% Serum Solids, 13% Sugar, .4% Gelatine.

Using 84% Butter, Skim Milk and Skim Milk Powder.

Problem II-A.

To Find Skim Milk Powder Required.

13.1 lbs. of 84% butter would be required to furnish 11 lbs. fat. 13.1 lbs. butter, 13 lbs. sugar, .4 lbs. gelatine; total 26.5 lbs. and 73.5 lbs. skim milk are required to make the mix up to 100 lbs. Calculate solids in 73.5 lbs. skim milk and subtract from 11.

100.00 lb. Mix	Fat 11.00 lbs.	S. S. 11.00 lbs.
13.00 lbs. sugar		
.40 lbs. gelatine		
13.10 lbs. butter		
73.50 lbs. skim milk		6.5415
100.00 lb. Mix		4.4585

Between 11 lbs. of serum solids required and 6.5415 lbs. of solids in 73.5 lbs. skim milk we have a shortage of serum solids. $4.4585 - .861$ shows that 5.178 lbs. skim milk powder will be required.

Problem II-B.

Complete and Prove Mix.

	Fat 11.00 lbs.	S. S. 11.00 lbs.
13.00 lbs. sugar		
.40 lbs. gelatine		
13.10 lbs. butter	11.00	
5.178 lbs. powder		4.919
68.322 lbs. skim milk		6.080
100.00 lb. Mix	11.00	10.999

Problem III.

Mixes Using Whole Unsweetened Condensed.

The factor for whole unsweetened condensed is .11812.

Whole condensed milk contains two ingredients. It increases the difficulty of balancing the mix, and increases the desirability of a factor. Assuming whole condensed to analyze 20% serum solids and 8% fat, the factor would be .11812. This will be near an average composition.

One pound of condensed adds .20 of a pound serum solid and since it contains 8% fat, which is substituted into the fixed content of the mix. It changes the amount of skim milk only .92 of a pound.

$$1 \text{ lb. cond.} \times .20 = .20 \text{ lb. serum solids,}$$

$$.92 \text{ lb. skim milk} \times .089 = .08188 \text{ lb. serum solids.}$$

.11812, factor or pounds serum solids which the mix is changed by each change of one pound of condensed milk. Similarly a factor is easily arrived at for any varying composition of condensed milk.

Safe Candy—Safe Ice Cream

The manufacturer of ice cream or candy owes a duty to his consuming public in selecting pure materials for his product. It is good business. For a product of uniformly good quality will find a constantly increasing market.

Play safe with your gelatine.

The test tube at the left contains Atlantic Super-Clarified Gelatine. Note its clarity—its high viscosity.

**"Purest and best—
It Stands the Test"**

We Will Let You Decide

Make the test of trying out our gelatine by ordering a barrel from the nearest office. Use five or fifteen pounds and if it doesn't match up with our claims for it, send the unused portion back. We will pay the freight both ways.

Atlantic super-clarified Gelatine passes the pure food requirements of every state in the Union. Special care in its manufacturing—use of only the finest raw materials—has resulted in a gelatine of unvarying high quality. It's a great satisfaction to know that your product always contains a dependable gelatine—of high viscosity and so good, so pure, so clear that is called Atlantic *super-clarified* Gelatine.

Experimental Studies in Ice Cream During Past Year

Continued Research Work Has Played Large Part in Advancing
the Science of Ice Cream Production and Thereby
Increasing Consumption

By PROFESSOR R. C. FISHER*

WHEN forty years ago a young man started making ice cream, little did he dream of operating a million-gallon factory in 1923. Even the wildest pipe dream did not permit such fantasies. And still today such a factory has become a reality and the young man who started making ice cream by stirring the mix with a paddle, today operates a factory with a capacity of over a million gallons a year. Nor is this man such an exception, for this audience counts among its members several who have started their career similarly and who by perseverance and business foresight have seen their business grow to large proportions.

A conception of the development of the business as a whole can best be gained from Chart No. 1, which shows the increase in gallonage from 1909 to 1923 as compared with the increase in population. A study of this chart shows that in 1909 the total production was about 80 million gallons where in 1922 it totaled to 263 millions or an increase of about 180 million gallons. During this period the population increased only 20 millions. The per capita consumption was about 1 gallon in 1909 and 2.4 gallons in 1922. An understanding and appreciation of the reasons that made possible this truly remarkable growth should furnish a guide for

* With the Connecticut Agricultural College. An address before the New England Association of Ice Cream Manufacturers, January 23, 1924.

future business policies. The principal reasons for the rapid development of the industry in the last 15 years are:

UNDoubtedly the perseverance and progressive ness of the pioneer ice cream man is a large factor. Ice cream was first made in Europe but never developed commercially. It took the aggressiveness and business ability of the American business man to develop it into the big industry it is today.

It is generally believed that prohibition has played an important part in increasing the ice cream business. As a matter of fact the relative increase from 1909 to 1913 is much larger than the increase from 1916 to 1920.

Until within rather recent years ice cream was considered more of a delicacy rather than a food. Even today there is a great deal of ignorance and misconception on the part of the public as to the just place of ice cream in the diet. The work of Dr. McCollum and Dr. Bailey and others, has proved the importance and absolute necessity of milk and dairy products in the diet. Charts Nos. 1 and 2 bring out the results of recent work of Dr. McCollum. The experiment is especially significant due to the fact that children were fed on the vari-

ous diets rather than rats as in previous experiments. In this case the children who received the milk diet were at an orphanage for colored children. The diet consisted principally of meat, potatoes, white bread and tubers. Very little milk or dairy products were fed previous to the experiment. The response to the milk diet as shown in the curve is truly remarkable.

Ice cream as shown in the following analysis is a dairy product except for the cane sugar and the small amount of gelatine and flavoring added to it. As such it is rich in butterfat, milk proteins, milk sugar, minerals and vitamins, that make milk such an important and practically indispensable food. There is, I believe, a great opportunity for increasing the consumption of ice cream by educating the people to the fact that ice cream is not only a delicious delicacy and refreshment, but an excellent and economical food that should take a bigger place in the diet of the home.

Crown Fruit Products

The QUALITY
FRUITS

*for Discriminating
Ice Cream Manufacturers*

Crown Fruit & Extract Co., Inc.

418-420 West Broadway
NEW YORK

ALLOW me once more to refer to the ambitious young fellow who started to make ice cream by stirring the mixture of cream, sugar and flavoring with a paddle, while the can set in an ice and salt mixture. What has research and science done for him. He has seen the brine freezer take the place of the old tub freezer; the dry hardening room replace the slopping in ice and salt; the homogenizer has insured him of a smoother body and texture and made possible the use of concentrated products such as butter and milk powders. The pasteurizing process assures him a more sanitary and safe

Chart No. 2.

product. The discovery that the crystallizing out of lactose was responsible for candy ice cream makes it possible for him to keep off the sandy shoals. These are

only a few of the many examples. What will the future bring us that is new? Most everyone appreciates the urgent need of continued research and experimental work especially in regard to quality. The public is becoming more and more discriminating. It requires more fully into quality and food value. A few years ago ice cream was just ice cream to most people. This situation is rapidly changing and people are learning to recognize good ice cream and to demand it. Competition is keener than ever. With a more discriminating public and the keenest competition, quality of product is a formidable weapon. So formidable a weapon indeed is quality that many a David, though small in stature, has been able to successfully combat the Goliaths in the ice cream business.

It is reasonable to assume then that quality of product will play an increasingly important part in the continued expansion of the ice cream business. I will, therefore, during the time that remains present the results of studies as to how various factors, such as composition, acidity and homogenizing pressures, affect the quality of the ice cream.

The influence of butterfat and serum on the flavor, body and texture were studied in a series of trials. The purpose was to determine if possible just what percentage of fat and serum solids gave the most desirable quality ice cream as judged by flavor, body and texture. In all studies great care was used to select only fresh and high quality products. The ingredients in each case came from the same batch of cream, milk and skim milk powder. These precautions were taken in order to have all other factors influencing flavor, body and texture under control so far as possible. Overrun was controlled so as to average about 85 per cent in each batch.

In the first series of trial the per cent of butterfat was varied from 6 per cent up to 20 per cent butterfat. The other ingredients were:

- 10 per cent serum solids.
- 14 per cent cane sugar.
- .3 per cent gelatine.

During the second series of trials the butterfat was

MANY INDUSTRIES CO-OPERATING TOWARD PRACTICAL COST SYSTEM.

A new trend in the development of cost accounting by American industries is disclosed in the report of the Uniform Cost Accounting Conference, recently held in New York. Reports submitted by individual members of the conference show that manufacturers in many important industries are co-operating directly in working out practical cost systems with the aid of expert accountants, rather than leaving it as heretofore entirely to the accountants to devise systems for particular industries.

Marked progress in this direction was reported at the conference which was attended by upward of 100 representatives of 103 industries, 23 more than were represented at the first conference held in Chicago in October. Some of the important industries represented were Portland cement, boots and shoes, paper, paint boxes, newsprint, women's wear, meat packing, paint and varnish, machine tools and tires.

The report reveals the practical methods employed in devising and installing uniform cost systems in the biscuit and cracker, the newsprint and other industries and the advantages derived from them. It also deals with the educational and legal aspects of the development of uniform cost accounting activities of trade associations.

The value of the opportunity to exchange views regarding the working out of various problems involved in the development and installation of uniform cost systems was expressed in a resolution adopted by the conference requesting the Department of Manufacture to hold similar meetings once or twice a year at convenient points.

"Trade associations and other similar agencies that have recognized cost accounting as one of their most constructive activities have generally made good progress in its development," said E. W. McCullough, manager of the department. "There is, however, a vast field for further endeavor among the many lines in which little effort has yet been made or with those who are struggling with the formation of methods and the securing of their adoption and use."

Mr. McCullough, who organized the conference, has announced that the full report of the proceedings is ready for distribution, and may be obtained upon application to the Department of Manufacture, Chamber of Commerce of the United States, Washington. "The conference was of so great value," said Mr. McCullough, "that its proceedings will serve as a text book on the subject of uniform cost accounting."

SOUTH CAROLINA FIRM MAKES FANCY ICE CREAM.

Foremost among the ice cream plants of the South is the Freyschmidt Ice Cream Co., Charleston, S. C., an organization which has been consistently successful since its establishment in 1920. This company specializes in fancy ice cream moldings, such as fruit designs, chocolate designs, flowers, and various other forms. The plant is said to be equipped with the latest type of ice cream manufacturing machinery, and one of the largest delivery systems in the state is operated by that plant, of which John A. McCormack is the head. Mr. McCormack is a prominent business man of South Carolina. Robert Pregall, secretary and treasurer of the firm, is in active charge.

MOST ECONOMICAL OF ECONOMY CABINETS

This **ECONOMY CORKBOARD CABINET** has created a sensation among the **ICE CREAM MANUFACTURERS** who have come to realize that superior insulation means money saved in ice consumption.

In addition to having superior insulation this cabinet has a tapered trough, conserving the ice and at the same time giving more insulation where the brine accumulates. This cabinet is equipped with cylinders, making it easy to replace a can of cream at any time.

Every **MANUFACTURER** owes it to himself to give this cabinet a thorough trial. Place your order now, increase your sales, by having your ice cream kept in the best condition with the least possible ice consumption, and **INCREASE YOUR PROFITS**.

This tapered cabinet has an average of 3" corkboard on the side and 4" on the bottom, lined on both sides by water-proofing paper. Equipped with $\frac{7}{8}$ " buffer board to protect bottom of cabinet, making a cabinet that is far superior to ordinary styles.

Tub Cabinets. This separate compartment is especially designed for rural trade, as one compartment alone can be used without being compelled to ice the entire cabinet. The tubs of the cabinets are especially treated to prevent leakage.

Dry Package Cabinets. Most efficient dispenser of Brick carton, dry bulk package, or Eskimo Pies. Each package goes to the customer in perfect condition, having had superior refrigeration in a container totally surrounded by ice, in a cabinet heavily insulated with cork.

Pacific Coast Plans Elaborate Ice Cream Show

Supplymen of Far West to Stage Exhibition at Joint Convention of Ice Cream Manufacturers of Coast and Northwest, in Connection with Pacific Dairy Classic in December

PLANNED long before the recent announcement by the Association of Ice Cream Supply Men that it would refuse to endorse, as a national organization, any regional shows of ice cream machinery, equipment or supplies this year, the big exposition planned in connection with the Pacific Coast conventions for December will be held just the same. The united ice cream industry of the West and the supply men catering to it have determined this year to put this vast territory upon the map and show the rest of the country that the Pacific Slope is to be reckoned with.

The joint convention of the Pacific Ice Cream Manufacturers' Association, comprising the ice cream industry in Washington, Oregon, Idaho, Montana and British Columbia, and the California and Southwestern States Ice Cream Manufacturers' Association, comprising the trade in California, Arizona, Nevada and the Hawaiian Islands, will be held in Oakland, California, December 10, 11 and 12, 1924. And the big exposition of machinery equipment and supplies will be held under the joint auspices of the Pacific Slope Dairy Show and the supply men of the Pacific ice cream industry at the same time and place. The convention is expected to bring to Oakland every ice cream manufacturer of any prominence, whether wholesale or retail, in the territory west of the Rocky Mountains, and the exposition will house the biggest showing of ice cream and dairying equipment ever gathered together west of the Mississippi.

THE show will be held in the Oakland Municipal Auditorium at Oakland, Cal., where 24,128 square feet of floor space is available for exhibits, all in one room, besides a like amount in corridors and special rooms, and where there are found, under the same roof, adequate convention halls, banquet halls, reception rooms and offices for several conventions to be held simultaneously, if necessary. The show will open December 10 and will continue through the evening of December 17. While the ice cream convention will be held only during the first three days of the show, the entire week will be taken up with state and regional conventions of other dairy industry organizations, including those of the creamery operators, the market milk producers, milk distributors, butter and cheese manufacturers, dairy stock breeders and the California Dairy Council.

Oakland, Cal., is situated across the bay from San Francisco and the Municipal Auditorium, facing the world-famed Lake Merritt, is as readily accessible from the San Francisco as from the Oakland hotels. With fast ferry and train service every 20 minutes during the day and night the Auditorium can be reached from any San Francisco hotel in 50 minutes, and it is within a pleasant 15-minute walk from the Hotel Oakland, which will probably be made headquarters for the ice cream manufacturers during the convention.

Showing
3/4" Style C,
Regular Plug

Something Better in Cabinet Valves

The one piece feature of Smith & Mann cabinet Drains was a big improvement over the "nipple types." It gave the ice cream manufacturer a cabinet drain that can be drawn up tight with assurance that there would be **no joints to leak**. Thus the messy floors about the dealer's cabinet are avoided; a better feeling instilled in the dealer and the rotting away of cabinets around drains is eliminated.

NOW THE SECURITY PLUG is another big advance in the construction of cabinet drains. The unique design and special "security" washer keep the plug snugly in place while the large opening is not restricted in drainage.

The Smith & Mann plug can not screw out or accidentally drop out and become lost. Neither can it be pulled out unless one knows how.

MADE OF NON-CORROSIVE METAL and cast in one piece, Smith & Mann cabinet drains are easily installed in cabinets and securely fastened against theft by a sturdy lock nut on the inside. Leather gasket on inside cabinet wall insures a leak-proof fit.

YOUR CO-OPERATION WITH OUR ADVERTISERS BRINGS DESIRED RESULTS.

THE decision of the supply men of the Pacific ice cream industry to hold the show, in spite of the national association's pronouncement against regional shows, recently broadcast through the trade press and ice cream organizations, was taken for several reasons. In the first place, the Pacific Slope Dairy Show will be held at the Oakland Municipal Auditorium whether or not the ice cream supply men join in it, and, as most of them cater to other branches of the dairy industry, many of them will be exhibiting anyhow with other equipment and the opportunity to reach all of the important ice cream manufacturers of the West at the same time is too good a one to be overlooked. Again, the decision of the two coast ice cream associations to hold a joint convention, the first in their history, and to gather together there in a three-day session all of the ice cream interests west of the Rocky Mountains, was largely predicated upon the idea of having an exposition of equipment and supplies at the same time and place. The Pacific supply men are determined that the manufacturers shall not be disappointed.

The sessions of the ice cream convention will be held Wednesday and Thursday afternoons, December 10 and 11, and all day Friday, December 12, and on the mornings of the three days the general public will be excluded from the show, so that the ice cream manufacturers in attendance will have an opportunity to inspect the exhibits at their leisure and discuss them with those exhibiting. The sessions on Wednesday and Thursday afternoon and on Friday morning will be joint, open sessions, the two associations meeting separately Friday afternoon in closed executive sessions, there to transact their annual business. Details of the program for the joint sessions are being worked out by the officers and committees of the two associations and the ice cream

manufacturers have been assured the best practical program which has ever been presented outside a national convention. The supply men of the Pacific ice cream industry are making elaborate plans for the entertainment of the visitors to the convention.

Diagrams of the floor plan of the Auditorium and the exhibit spaces are now being prepared and will be ready for issue about June 1, and all of the details of the exposition will be handled by the Pacific Slope Dairy Show, Inc., 216 Pine Street, San Francisco, though space reservations or any details will be handled by the Pacific supply men for any exhibitor not represented on the coast and who may desire such service. This will be the fourth annual show held by this organization, which is a branch of the California Dairy Council and is supported by all of the dairy industry organizations of the state for the purpose of promoting the interests of the industry as a whole. The first show, held in Stockton, Cal., in 1921, was the beginning of the great movement which has resulted in the unification of the dairy industry and supply interests of the entire Pacific coast territory. The second show was held at Fresno, Cal., in 1922, and the third at Oakland in 1923. Each year the show has more than doubled its capacity and interest and the movement has been so successful that, under the combined auspices of the state of California, the city of San Francisco and a large number of civic and industrial organizations, plans have been adopted and work is to be commenced shortly on an immense new exposition building, costing \$7,200,000, to be the permanent home of the Pacific Slope Dairy Show and to be built upon the site of the 1915 Panama-Pacific International Exposition.

THE supply men of the Pacific ice cream industry, which is working jointly with the Pacific Slope Dairy Show for the success of the exposition, is composed of practically all of the supply men catering to the ice cream industry in the Pacific coast states. It comprises many of the members of the National Association of Ice Cream Supply Men and practically all of the big firms doing a nation-wide business who are represented on the coast by personal agents, as well as a large number of supply firms located and doing business only on the coast.

The organization was formed in November, 1922, at the Fresno convention of the California and Southwestern Ice Cream Manufacturers' Association and has grown in numbers, strength and importance during the two years since that time. The supply men catering to the ice cream industry had for many years been attending the conventions of the Pacific association and of the California and Southwestern States Association

AMERICAN DAIRY FEDERATION TO MEET AT NATIONAL DAIRY SHOW.

Washington, D. C., May 3, 1924.

At a meeting of the executive committee of the American Dairy Federation, held at this office May 2, it was voted to make Wednesday evening, October 1, the date of a general meeting of all branches of the dairy industry under the auspices of the American Dairy Federation in connection with the National Dairy Exposition at Milwaukee.

The character of the meeting, the place and the program are to be worked out by the special committee consisting of Hon. Frank O. Lowden, president; E. M. Bailey, chairman executive committee, and A. M. Loomis, secretary of the federation in co-operation with W. E. Skinner, manager of the exposition.

Letters already received from executives of member organizations indicate a desire to have one date reserved for this event, so that events planned by other organizations could be arranged without conflict so far as possible. This notification is being sent as early as possible with this purpose primarily in mind. We hope to have this meeting one of the most largely attended and most notable ever held for the benefit of the American dairy industry.

The committee voted to secure the presence, if possible, of one speaker of national and governmental prominence, one of business or financial prominence, and one to represent the welfare and public health side of the industry. The secretary will be glad to receive suggestions as to speakers whom you would like to hear. I believe that the industry can secure the presence of almost any speaker who may be desired for this event.

Yours sincerely,

A. M. LOOMIS, Secretary.

GEORGIA PLANT GROWING.

A newspaper report from Augusta, Ga., indicates that the Augusta Creamery, which manufactured ice cream, is gradually going forward in development of consumption. The business is operated by W. F. Timm and H. I. Hill. It has been in business in Augusta for the past five years. Mr. Hill supervises the making of the ice cream.

STICKS UP FOR 10-CENT SODA.

The editor of the Cedar Rapids, Ia., Republican sticks up for the ten-cent soda. After pointing out that already it is possible to find supposedly grown up persons who cannot remember when ice cream sodas sold for five cents, that newspaper points out that a ten-cent ice cream soda is not out of proportion when it is remembered that the standard of value is approximately what a man's salary and wages will purchase for him and not the number of dollars in his pay envelope.

"The trouble now is that everything now is measured with a sixty-cent dollar," an editorial in a recent issue of that paper reads: "When a man goes in to buy a hat for \$5.00 he should remember that he is really paying \$3.00 for the hat as measured in terms of the dollar of the pre-war days. It is the old story that was so often during the free silver argument.

"The fact that a man gets \$5.00 a day does not necessarily mean that he is twice as well off as he was when he was getting \$2.50 a day. The ten-cent ice cream is out of proportion and the seven or eight-cent ear of corn is a very small advance in price compared with the prices of other things that the public has to buy."

NATIONAL CONVENTION—NEW ORLEANS—NOVEMBER 17-20, 1924.

Give Us the Opportunity and We Will Help You Improve Your Product

Our Service Department has learned, through years of experimenting, that sugar has much to do with the quality of ice cream.

FRANKLIN CLEAR INVERT SUGAR

is water white, 42° Baume. It doesn't crystallize, nor does it ferment. It will produce a fine texture and reduce your overhead.

This acid free sugar is exactly the thing for

"A Franklin Cane Sugar for every use"

Electric Motors, Their Care and Attention

By F. B. FULMER

(Written especially for The Ice Cream Review.)

THERE are several kinds and types of electric motors in use, and while each one may require some particular attention due to its specific construction, there are many points in common that will apply to them all.

Where a new motor is secured, it should be carefully inspected before it is placed in service. The bearings should be taken out and thoroughly cleaned by washing with kerosene to remove any dust, grit or gummy substance that may be present. While a motor may have been clean when assembled and tested in the factory where it was manufactured, dust or grit may (and probably will) get into the bearings during period of shipment and handling prior to being set up where it is to be used.

If there is any question about foreign matter being in the motor, the rotating part (called the rotor) should be taken out and cleaned. As this part of the motor is wholly metallic it can be washed with gasoline and a stiff brush, or a jet of steam can be used to blow the dirt away, after which the rotor can be placed in some warm place where it will quickly dry.

The frame which contains the field coils, or stator, should never be cleaned with any liquid substance, for no matter what its nature may be it will either allow moisture to get in between the wires of the field coils, or stator, or it will soften the insulation on the wires, and when the insulation is broken down, the motor will have to be rewound to prevent its burning up—due to a short circuit of the current when it is operating. A stiff brush and a piece of clean cloth should be used to remove the dust and dirt that may be present. It is good practice to clean the field, or stator coils, at least once each year and put on a coat of some good, waterproof quick-drying paint to protect the insulation.

Practically all prime movers are located in clean, convenient and light places where they can be easily in-

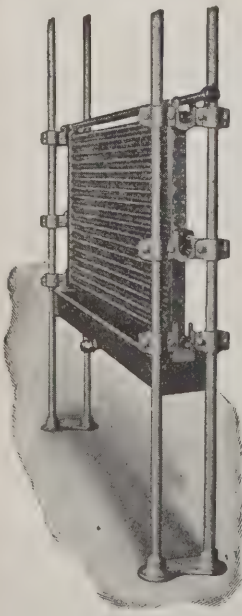

spected at frequent intervals; on the other hand electric motors are often found in some dark out-of-the-way place where they receive but very little attention, due largely to the inaccessibility of their location.

While it is true that the motor will run longer than most kinds of machinery without attention, it is very poor mechanical practice not to give it some attention, hence its location should be such that it is as accessible as possible.

Also due to the adaptability of motors to run in different positions, by changing the housings that supports the bearings, quite often small and medium sized ones are found fastened upside down on the ceiling, or on the side walls of a room, and while this arrangement may be one of convenience, it jeopardizes the ease of attention.

SMALL motors require no special foundation, except that they are placed on something firm enough to keep them solid at all times. Larger motors should have a raised concrete foundation for the bed plate to rest upon in a perfectly level position and the foundation bolts should be kept tight.

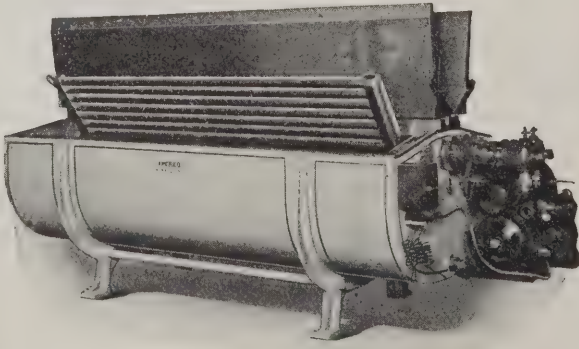

The bed plate should be cemented to the foundation, using a mixture of one part of Portland cement and two parts of clean, sharp sand. Thoroughly mix the cement and sand before adding any water. Enough water should be used to produce a thin solution, or a mixture that will run freely. Construct a form around the bed plate and pour this solution under the bed plate, continuing the process until the cement has raised about half an inch up the sides of the bed plate. The entire operation should be carried on without interruption and as rapidly as possible until it is completed, in order to prevent any part of the cement from partially setting, causing an uneven distribution of material resulting in a weakness of the foundation. After the cement has sufficiently hardened, remove the form and smooth out

30000 Sanitary Fittings From Which To Fill Your Order

A MINIMUM stock of 30000 Burrell-Simplex Sanitary Fittings are always kept on hand — to make sure you can get *what* you want *when* you want it. And not less than 20000 feet of Burrell-Simplex Sanitary Pipe constantly await your order.

Not only is this large stock maintained as assurance that your order will be shipped the same day or, at the latest, the day following its receipt — the dimensional specifications conform to the standards established by the International Association of Milk Dealers. So you can order your fittings from Burrell knowing in advance that your order will be filled *immediately*, that the fittings will *fit*, that the quality *is unsurpassed*.

The standardization of diameters and threads, in order to make fittings of different

makes interchangeable, was a splendid move, but these accepted standards in dimensions has no relation to quality — character of metal, weight, workmanship, finish, style, etc.

Burrell-Simplex Sanitary Fittings are made of special bronze which is not only unusually hard but is free from metallic-flavoring metals. Moreover, this special analysis bronze is varied to best meet the needs of particular fittings; for instance, a part to which a wrench is directly applied is made tougher and stronger so as to stand this harder wear.

The superiority of Burrell-Simplex Sanitary Fittings is also reflected by the precisely correct taper of the cocks. This minute correctness assures easy turning without leaking and without danger of the cocks becoming unseated by ordinary pressure in the piping.

Send today for catalog section showing Burrell-Simplex Sanitary Fittings. Please address Dept. 25

IF YOU KEEP UP WITH OUR ADVERTISERS, YOU KEEP UP WITH PROGRESS.

any uneven or rough places. After the cement has become real hard tighten the foundation bolts.

If a wooden foundation is used the bed plate should be tested with a reliable level every three months to see if any warping has occurred since the inspection.

It is essential that foundations be kept firm and level, otherwise vibration will follow when the motor is operating, which will result in excessive wear.

AFTER a motor has been placed in its proper position and connected with the wires that are to supply it with electric current, it should be properly lubricated and turned by hand to ascertain if it will move freely. The first time that the oil wells are filled they should be allowed to overflow so as to carry out any light foreign matter that may have been overlooked when it was cleaned, or that may have accidentally gotten in later.

Every Sheet Equally Good

You won't have any trouble for lack of uniformity in **Novoid Pure Compressed Corkboard**. Every sheet is as good as the best.

Pick out any sheet at random and you will find that it contains nothing but specially selected, clean, dry stock, uniformly baked through and through, with sharp, square edges and corners.

Novoid Corkboard

is moulded in sheets 24" wide, then cut into 12" widths, and the 2" sheets are made by splitting sheets 4" thick.

Consequently our inspectors can examine the inside as well as the outside of every sheet. And you can do likewise.

No other corkboard is made so you can see the inside of the sheet.

Write for interesting booklet.

CORK IMPORT CORPORATION

345-349 West 40th Street, New York
Branches in large cities

All points associated with the lubrication should be carefully watched; the oil rings should move freely so that they carry a sufficient quantity of oil to the bearing. If the bearing is not perfectly level, one side will probably receive more oil than the other, which may cause heating or cutting. Again, if the motor is not set level, the rotor will run against the end of one bearing and instances have been known where this has caused a part of the babbitt to melt.

When the electric power is used to run the motor, it should be started very slowly and run for a short time only and the power turned off. After a few startings and stoppings if the motor seems to run freely, with no apparent heating, it should be run without any load for a few hours that the shaft and bearings may become worn to perfect alignment. If, during this time, there is any evidence of undue heating, the motor should be stopped at once and allowed to cool down to room temperature.

The writer very distinctly remembers an experience with a new motor that had bronze bearings. The motor had stood the cautious starting tests for two-thirds of a day and appeared to be in the best of condition. The next morning it was put into use and during the first hour it was inspected every few minutes and gave no pronounced evidence of heating. In less than half an hour later it suddenly became very hot and the bearings "froze" to the shaft.

If the motor has much of a load placed upon it, or has a run of over an hour, it should be given very careful attention for at least three days operating time.

THE heating of a motor may be classed under two general divisions, mechanical and electrical. The mechanical heating applies more, particularly to the bearings and may be due to one or more causes: Excessive belt tension, failure of the oil rings to revolve with the shaft, rough bearing surface, improper alignment of the bearings with the shaft, bent shaft, inferior grade of lubricant, bearings adjusted too tightly, end thrust due to improper leveling, causing excessive pressure of the shoulder of the shaft against the side of the bearing, too much end play of the shaft allowing the motor to get out of line with the field coils and excessive side pull because is out of center.

Should a bearing become hot, it is good practice to first feed heavy oil into it and loosen the nuts on the bearing cap. If the heating continues, the belt tension should be slackened, and if relief is not afforded, the motor should have the load removed and run idle so it will not "freeze" in the bearings.

The lubrication of motors should be given special at-

For Lasting Satisfaction

York
Refrigerating
Equipment

One reason why there are so many installations of York Refrigerating Equipment is that its satisfactory working condition does not pass with the seasons. York Equipment does not mean satisfaction until the first signs of wear show up, but a year in year out dependable service that stands the strain of rush seasons without injury to its long life.

Let us show you just why
York Equipment lasts longer.

WESTERLIN & CAMPBELL CO.
CHICAGO, ILLINOIS

J. G. HAMMERSCHLAG, Wisconsin Manager
1016 Majestic Bldg. Milwaukee, Wisconsin

Baird Refrigerator Bodies Extra Capacity for Peak Days

WHEN desired, the empty can compartment of any Model 10 BAIRD REFRIGERATOR BODY can be provided with a refrigerating pan in the top and with one inch of cork insulation in the walls and doors. Thus equipped, this compartment will hold from 75 to 140 gallons of ice cream (depending on size of body) in good condition for approximately five hours in the hottest weather.

For instance, the Empty Can Compartment of our 350-gallon body, when insulated and refrigerated, will hold 140 gallons of ice cream in addition to that in the ice cream compartment. This gives a total capacity of practically 500-gallons when it is needed—and without extra weight.

This is one more reason for buying those good BAIRD REFRIGERATOR BODIES. They mean three degrees below zero—light weight—perfect insulation—and absolutely no brine dripped on the chassis, on the street, or in the garage at any time.

OFFICE: 401 Chamber of Commerce, BOSTON, MASS.

FACTORY: WINCHESTER, MASS.

tention at all times. It seems to be a recognized fact that a large part of the trouble with all mechanical appliances used in dairy manufacturing is improper lubrication, and this applies to a motor as well as other machinery. It is generally conceded that the most effective means of preventing a malady from developing is to remove the cause; hence the necessity of giving close attention to prevent trouble from arising, hence if a motor has operated in a satisfactory manner for six months, the bearings should be cleaned out and a new charge of oil put in. This will apply also to the motors that have ball bearings and use grease as a lubricant, for there is some frictional resistance in any type of bearings and it necessarily follows there must be mechanical wear that deteriorates the lubricant used.

The electrical heating is a condition that is not so nearly under the control of the operator as the mechanical and the causes usually are not as apparent. In many cases the electrical heating comes from an overload on the motor.

All motors are constructed to stand some overload for a short period of time only and they should never be loaded beyond their capacity. Several years ago motors were constructed with a large reserve capacity, and an overload for a considerable length of time was not such an important element, but of recent years most of the new motors do not have any reserve capacity, hence the question of overloading has become a more vital matter. It is an interesting thing to compare the size of two motors of the same rated capacity, manufactured by the same company, the one having been manufactured twenty years ago and the other within the last two years. Undoubtedly a casual glance will impress one that the older motor should have double the rating of the smaller one.

Another cause for motors heating is low voltage. All motors are built for a certain voltage that is stamped on the brass plate on the frame, usually near the top, and if the electric current drops much below the voltage required for the motor it will heat, and if this condition continues for a long period of time serious results will follow.

NEARLY all motors have a number stamped on the brass plate, which is marked "degrees" and this is the limit set by the designer for temperature rise. The older motors were usually rated at "40 degree" motors and the newer ones are rated as "50 degree" motors, these numbers represent the allowable rise in temperature in centigrade, by the manufacturer, the starting point being ordinary room temperature. As 40 degrees centigrade equals 104 degrees on the Fahrenheit scale and 50 degrees centigrade equals 122 degrees Fahrenheit, it is quite obvious why there are no more "40 degree" motors being made, as it means that the manufacturers have decided that conditions of labor, material and competition are such, that the cost of building a "40 degree" motor is too great, hence they have allowed the guaranteed raise of **temperature to be increased** nearly twenty degrees! A simple calculation will demonstrate the reason why. Assume that an ordinary warm day the air surrounding a motor loaded to capacity was 80 degrees Fahrenheit. Now 80 plus 122 (the 50 degree rating) will give a temperature of 202, or nearly at the boiling point of water!

While it is true that most of the material that enters into the construction of a motor might stand the boiling temperature for a short time, it is also true that a temperature like this for any extended period of time would tend to "break down" the material which would end in disaster.

The question of increase in temperature due to prolonged overload is well illustrated by quoting from a well known manufacturer of electric motors—"A 40 degree rating motor is an open type motor, having a 40 degree centigrade temperature rise guarantee under continuous operation, with a two hour 25 per cent overload guarantee at 55 degrees centigrade.

The question may naturally arise, "How does the high temperature injure a motor, as it is constructed nearly all of copper and iron?" It is the insulating material such as cotton, silk, oil-linnen, linnen tape, fish paper or leatheroid, etc., that is carbonized by the excessive heat and when carbonization occurs the insulating properties are destroyed and short circuits occur, resulting in serious damage.

The principle involved is analogous to a person allowing a coat sleeve to come in contact with an unprotected steam pipe; a contact for a few seconds of time will, most probably, result in no injury to the fabric of the garment, but a few minutes contact will destroy the fabric and cause physical distress as well.

The degree of heat that is injurious or objectionable in any part of a motor is easily determined by feeling the various parts. If the heat is bearable for a few minutes, it is entirely harmless. But if the heat is unbearable for more than a few seconds, the safe limit of temperature has been passed, and immediate attention should be given the motor. In testing with the hand allowance should be made for the fact that bare metal feels quite hot in comparison with other materials that may have the same temperature.

If the heat has become so great as to produce an odor or smoke, the safe limit has been exceeded and the motor

Watch Iceless Cabinet Size!

THE Nizer is the most compact, the smallest automatic ice cream cabinet known. The floor space it saves is an important item.

But of equal importance is the fact that it lines up exactly with "short fountain interiors."

"Short fountain interiors," either of the direct-icing or mechanically refrigerated type, holds the syrups, fruits, bottled goods and water coils.

They measure about 29 inches wide and 29 inches high (32" including supports) the same dimensions as a Nizer Ice Cream Cabinet. Together, within a counter, they make an ideal complete fountain.

It is easy to see that were the Nizer either wider or higher it would be out of line with

the "short interiors" and therefore encroach upon the already cramped aisle space or project up and interfere with serving.

The rapidly growing tendency in stores is to put all fountain equipment within the counter—and so, we believe, it is wise to buy only iceless cabinets which fit in properly.

Another point! The Nizer passes easily through a standard 30-inch door-way, avoiding the delays and alterations which might otherwise be necessary.

The extreme compactness of the Nizer is possible because its refrigerating machine is so efficient and the cabinet so well made that one-half the usual thickness of insulation is ample.

Watch iceless cabinet size!

AMONG THE BRIGHTEST THINGS IN THE REVIEW ARE THE ADS—READ THEM.

should be relieved of its load at once. In no instance should water or ice ever be used to cool a motor.

Feeling for heat will answer in ordinary cases, but of course, the sensitiveness of the hands differ and the back is more sensitive and less variable than the palm for this test. For accurate results a thermometer should be used and the bulb covered with cotton waste to keep in the heat.

Even when a thermometer is used, it may not indicate the temperature of the hottest place by 10 to 15 degrees F. A rule used in practice by many electricians to determine the heat limit is—place the palm of the hand on the motor so it will rest firmly and if you can count twenty, keeping time with seconds, the degree of heat is safe; if you cannot keep the hand on the motor while counting twenty, the heat is dangerous. From a safe operating standpoint it is exceedingly doubtful to allow any part of a motor for any considerable period of time to attain a temperature above 170 degrees F., for aside from the danger of carbonizing the insulating material, the silk that is used in motor construction will carry electric current after it has been heated to a high temperature, hence its insulating properties are weakened.

AN electric motor is a machine that must be kept absolutely free from moisture at all times for successful operation. With this in view the motor must be protected from any chance of water splashing into it or dripping upon it and should be located in as dry a place as possible.

The moisture has a tendency to soften the insulation and when it becomes saturated it will permit the current to form a short circuit and, electrically speaking, the motor will "burn up." This means that the insu-

lation will be destroyed and before the motor can be used it will have to be rewound, which will require a complete set of new wires in the frame.

If relatively large quantities of water are allowed to come in contact with the rotor, arcs will be formed and the metal burnt in spots to the extent that it will be useless and operation become impossible.

Where there is danger of water being splashed on a motor—like one direct connected to an ice cream freezer or a pasteurizer, a suitable metallic cover should be provided to protect the motor. This cover should be as large as is possible to allow a free circulation of air around the motor, as a poorly ventilated motor may unduly heat. Practically all motors of recent construction have some fan arrangement built on the ends of the rotor to circulate the air and suitable air ducts are arranged in the frame to permit the free circulation of air that the heat may be carried out and dissipated in the surrounding atmosphere.

If for any reason a motor has become saturated with moisture it can be dried out by being short circuited on the rotor, but as this is a very delicate operation it is much safer to secure the services of an experienced electrician for this work, as there is always danger of over-heating the windings of a machine when drying it with current, as the insulating material is more easily damaged when damp than when dry. It may require several hours and even days to thoroughly dry a motor, depending on the degree of saturation.

If a motor can be placed in a room where there is dry warm air, a moderate degree of drying out can be accomplished by allowing one or more house or office fans to blow a current of the air into it, and while this is a safe method, it is also a slow one, when there is much moisture present.

Carelessness on the part of the operator in allowing moisture to come in contact with the motor will shorten its period of usefulness, while if it had been kept dry it would have given efficient service for years.

DUST, especially if it is of a metallic nature, is a great menace to motors. A sheet of common white writing paper is to all intents and purposes a perfect practical insulator—but draw a common lead pencil mark across it from one end to the other and the paper becomes a conductor of electrical energy!

By this same token all dust that may lodge in the windings of a motor becomes latent elements of a conductor. If the dust be composed of organic matter the constant heat that is developed during the operation of the motor, will tend to carbonize it, when the same condition will prevail, like the breaking down of the insulation.

From this the inevitable conclusion follows that a motor should be kept free from dust at all times, as the dust not only is a potential danger for short circuits, but also clogs the air ducts and impairs the ventilation. Recently the manufacturers are making provision to guard and screen the motors from accumulations of dust.

Compressed air, when available, is a very effective remover of dust when blown into the motor; small portable blowers, that can be operated from an ordinary light socket are very convenient. Hand bellows may also be used to blow light dust out. Periodic inspection should be made and a thorough cleaning given when necessary.

IN the smaller size motors the space between the rotor and the field coils is supposed to be uniform at all points. In nearly all of the larger size motors the rotor is set about one-thirty-second of an inch above the true

EVERY MANUFACTURER IN THE COUNTRY SHOULD BE A MEMBER OF THE NATIONAL ASSN. OF ICE CREAM MFRS.

center. The reason for this is the mechanical clearance being less on the top of the rotor, the magnetic attraction will be greater resulting in the downward pressure on the bearings being lessened, but this condition can be allowed to a limited extent only or the rotor will become unbalanced and serious trouble will follow.

When a new motor is put into use the clearance, or the air gap, should be carefully noted. This can be accomplished by using a slim, narrow wedge made out of hardwood. The distance that the wedge enters between the rotor and the field coils should be carefully measured. Put a rule on the wedge and note the distance from the end of the rotor to the large end of the wedge and this deducted from the total length will give the distance that it enters.

After the motor has been operated two or three months, depending on the amount of work it is doing, the air gap should be measured again and any difference noted. When any appreciable difference in measurements is noticed, a close inspection should follow to determine if the bearings have worn enough to allow the rotor to drop down from its former position, so there is danger of it dragging on the bottom of the field coils. If this should occur, the insulation will be cut through as the rotor revolves and a short circuit will result, causing severe damage to the motor.

AN electric motor is generally considered an efficient machine. A certain amount of current is delivered to a motor and this is termed the **input** and the motor performs a certain amount of work and this is termed the **output**; expressed percentagely, the difference between the input and the output is the loss. However, the term loss is not a strictly true one, for the energy

converted into heat in the motor is lost only in relation to its utility, in that it cannot be utilized to advantage and if the heat is too intense it endangers the life of the machine.

A motor is a machine for transforming electrical energy into mechanical work and the percentage of energy converted into practical work is termed the efficiency. In electrical calculations the watt is the unit of power developed and it requires 746 watts to equal one horse power. The usual way of expressing electrical power is in kilowatts, written K. W., and a K. W. represents 1,000 watts.

If the input to a motor is 10 K. W., and the output is 8 K. W., the efficiency would be 80 per cent and the loss 20 per cent. In ordinary practice with the smaller size motors, the efficiency will average about 85 per cent and some of the large motors may operate at 90 per cent efficiency. The question may arise, what causes the loss. The total loss in a motor can be separated into divisional losses, depending upon the manner in which the loss is produced and the part of the motor in which it occurs. Usually the losses will come under one of the following divisions: Mechanical friction loss, core loss, field loss, and rotor loss. The discussion of each one of these losses would be an interesting subject in itself but as they are in a measure beyond the control of the ordinary operator, they will not be considered at this time.

As a general proposition, if an electric motor is given reasonable attention and operated under favorable conditions, it will render efficient and dependable service for many years.

"MYSTERY BRICK" CONTEST.

A mystery brick contest recently was held by the Forsyth Dairy Co., Winston-Salem, N. C., to advertise its "Carolina Cream." The introduction of its special brick combination was the chief aim of the contest.

The contest was open to everyone, and a number of ice cream consumers of that part of the country engaged in it. The contest was simultaneous with the introduction to the public of a brick containing three flavors of a mystery combination. These flavors were advertised as being so delectable, appealing and delicious that only the word "mystery" could describe the product. No one but Charles E. Landreth, manager of the company, knew the combination of the flavors.

The public was asked to name the flavors, everybody being allowed as many guesses as they wished. All persons who had the correct answers won free ice cream a quart for each week for a year.

Mr. Landreth deposited in the hands of R. M. Hanes vice-president of the Wachovia Bank and Trust Co., a sealed envelope containing a sheet of paper on which was written the names of the three flavors used in making the "mystery" flavor. This envelope was opened in the presence of the officials of the bank, who certified to the names of the three flavors written on the sheet of paper.

ILLINOIS CO. EXPANDS.

Hey Bros. Ice Cream & Dairy Produce Co., Sterling, Ill., has absorbed the business of the Sterling Ice Cream Co. of that city. The enlarged company is installing refrigerated cabinets for all its principal customers. No other new machinery will be added for the present, according to J. L. McKinney.

ANDERSON "Cut-Wrap" Machine

"It Wraps as it Cuts"

**Simple ... Rapid ...
Practical ... Low Priced**

IN designing and experimenting on the Cut-Wrap idea, it was the desire to perfect a faster machine that would quickly cut ice cream slices wrapped on three sides. Our final accomplishment was greater than this, because while it does this rapidly, yet it as capably cuts quarts and pints; or even slices quarts into sizes suitable for Eskimo Pies. This wrapped idea is a good one for every Ice Cream Manufacturer—large or small.

Ices Can Be Profitable to Small Manufacturers

Any Manufacturer Can Stock Ice on Hand to Fill Short Orders for Sherbet

By PERCY WERNER*

THE SMALL ice cream manufacturer frequently is forced to turn down orders for ices and sherbets which the big manufacturer keeps in stock. Even if time is allowed to fill the order, extra expense is involved in freezing up small batches of a gallon or less. This problem bothered the writer considerably until an experiment was made with stock ice made by the same formula used in all our ices with the exception that no flavor is added until required.

Now we keep on hand from two to ten gallons of this stock ice at all times. If an order comes in for a half-gallon of cherry ice we can fill the order by mixing a few cherries with a quart of the stock ice. The same is done with all the other flavors and fruits that any of our customers want in ices. It is our belief that even a better quality of ice is furnished in this way than where a flavored ice is kept on hand for several weeks. Ices move slowly and by this means a batch is sold quicker than where several varieties are kept on hand.

The success of the method had aided us in selling bricks containing a layer of ice. Where formerly we were prepared to furnish but three brick combinations containing ice, we can now put any of the ices in bricks on an hour's notice. This is an important factor when

* Secretary, Wall Ice Cream Co., Quincy, Ill. (Written especially for The Ice Cream Review.)

the profit in ices is considered. At present more than a fourth of our bricks contain a layer of ice.

THE formula used for the stock ice is as follows. Twenty pounds of sugar, six ounces of gelatine dissolved in a gallon of hot water, four ounces of citric acid solution (50 per cent solution), water sufficient to make seven gallons of mix. This will give an ice of very light body which, when mixed with flavoring or fruit, will pack down to a good body. If the flavoring to be used consists of a heavy sugar syrup, less sugar should be used in the mix (16 pounds), as it is almost impossible to keep an ice or put it in a brick if the sugar concentration is too high.

It will pay any manufacturer, no matter how small, to cultivate the taste of his customers for ices. Our ices vary considerably in cost but none of them cost as much as vanilla ice cream, and some of them cost less than half. Our pineapple ice is the most expensive, as we use three No. 10 cans of crushed pineapple to the ten-gallon batch. Where flavoring extracts or syrups are used the cost is less. Many of our fruit syrups we prepare ourselves when the fruit is in season. By putting down strawberries in the cooler, half sugar and half fruit, excellent berries are secured for fruit or strawberry ice cream and an excellent strawberry syrup settles at the bottom of the barrel, which is unexcelled for the manufacture of strawberry ice. In Quincy we get the same price for ices that we do for our fancy ice cream—\$1.15 a gallon wholesale and \$1.75 retail.

NEW HUTCHINSON PLANT OPERATING.

The Hutchinson Ice Cream Co. has begun operations in its handsome new plant at Leon, Ia. Early in May there still was some work to be done at the plant toward completing the installation of machinery and equipment, but the workmen are busy with production, and distribution was being made on a wide scale.

H. A. Sweger, who went to Leon from Des Moines to direct the building and equipping of the plant, is the manager in charge. He says he is supplying a large trade throughout the southern part of Iowa and northern Missouri. The new plant has a capacity of 1,000 gallons of ice cream a day.

Building Business in the Small Town

**This Small Town Manufacturer Increased Gallonage 600
Gallons for March, 1924, Over March, 1923,
by Co-operating with Dealers**

THERE is more business for the small-town ice cream manufacturer than some manufacturers realize. Being located in a town of only 17,000 inhabitants has not kept the Radley Ice Cream Co. from devising novel methods of increasing consumption. Officials realized that there was plenty of business to get—and they went after it. When the Radley Ice Cream Company succeeded the Finney Ice Cream & Creamery Co. in Arkansas City, Kan., on March 5, 1923, conditions prevailing at this plant necessitated starting at the bottom and virtually building a new business. However, consistent, carefully planned advertising, together with a quality product, achieved its reward, and the company's business is showing a steady increase, according to L. G. Blevins, manager. The Radley Ice Cream Company is the only ice cream plant in its town. This company has increased its gallonage during March this year over that of the same month last year by 519 gallons, and during the month of April an increase of 1,077 gallons is recorded over the same time last year. During the month of May, Mr. Blevins expects to treble their last year's gallonage for the same period. The company sold 30,305 gallons of ice cream during their fiscal year, from February, 1923, to February, 1924. Officials advise that they have set their goal for 1924 at 75,000 gallons.

THE plant is equipped with two 40-quart horizontal freezers and one hardening room. It has a daily capacity of 750 gallons. Improvements to the plant were announced a few months ago, but Mr. Blevins advises that a later decision of the officials postponed these improvements. Their present plans call for the erection of a new building to be started during the coming winter and they say they will erect and equip the most modern small plant in the country.

Quality is one of the main factors of the Radley ice cream and, according to Mr. Blevins, his product brings twenty cents more wholesale than that of the nearest competitor. The Arkansas city firm does not supply cabinets to dealers. However, they co-operate with their dealers to the fullest extent by advertising consistently in newspapers, supplying fountain display material, and distributing novelties that appeal to the children. One of the novel methods of advertising was inaugurated during their Eskimo pie campaign during the winter months when a slip of paper with reading matter was enclosed in the wrapper of each Eskimo pie. Some of the slips contained a misspelled word. To the persons getting the slips with the misspelled word, an Eskimo pie was given free. This resulted in a very large sale of pies and also materially increased the sale of their special ice creams, according to the manager.

THE Radley Ice Cream Company endeavors to co-operate with the dealers to the fullest extent. They made special announcement that 1,000 boys' flying kites would be given away. Every boy loves a kite and getting one absolutely free is one of the grand and glorious things that happen in a boy's life. Every boy also likes ice cream cones so a coupon was given with each ice cream cone purchased. When the boy had collected five coupons he returned them to the dealer and received his kite free. This method proved to be a big hit even with the grown up and materially increased ice cream sales during the cold weather, we are told. During Kansas Ice Cream Week, beginning June 1, the company is planning to put over the same stunt but will distribute flying birds instead of kites, which will also appeal to the little girls.

Joy rubber ball campaign was also entered into by the Radley Ice Cream Co. With every quart of ice cream purchased a coupon is given. By redeeming three coupons, a small size rubber ball would be received and five coupons would give the holder of the coupons a much larger Joy rubber ball. Within two weeks after the campaign had been started, sixty-five Joy rubber balls had been distributed to the purchasers of Velvet ice cream, "The Food You Love to Eat," and the officials expect to place that many in a day or two during the summer months.

This company is a subsidiary of the Winfield Dairy Co., operated by C. A. Radley of Windfield, Kan., but the Arkansas City plant is independently managed by L. G. Blevins.

Anyone who studies the advertisements in this paper does not have to be told that it is a profitable habit. He collects the profits daily.

THE BESTOV CALENDAR

EQUIPMENT FOR HANDLING

MILK FROM COW TO CONSUMER

A Filter Designed for the Ice Cream Mix

THE FIRST and ORIGINAL FILTER for ICE CREAM MIX

THERE is an absolute need for a MIX filter even in the most careful and scrupulous factory. Filtering the milk alone won't do it; gelatin and sugar contribute to the fine dirt that pipe line strainers do not remove.

THE NEW BESTOV FILTER IS DESIGNED ESPECIALLY TO HANDLE ICE CREAM MIX. A newly developed filter cloth, furnished with it, removes every particle of dirt from ice cream, and yet will perfectly handle a mix containing sugar and gelatin. The sandy particles which destroy viscolizer and homogenizer valves are removed.

Besides being the only filter designed for ice cream mixes, the Bestov Filter is the most convenient and economical one to operate. By removing the **top**, the filter cloth is drawn out easily and quickly. The mix does not run over the floor; there is no waste. It is not necessary to wait for contents to filter through — the cloth may be changed at any time. Neither is there any danger of bursting the filter cloth. Altogether, the design of the Bestov Filter eliminates the undesirable features now found in many milk filters.

Representative concerns, like the following, have acknowledged the importance of mix filtration by purchasing filters from us. *The results* are convincing; they will not operate again without filters.

TEXAS PLANT EXPANDS.

The Robert Thompson ice cream factory, Taylor, Tex., will be equipped with the latest type of machinery and construction will be made so that machinery can be added later in units of 200 gallons capacity when expansion is necessary.

Excavation has started and erection of a solid brick and concrete building that will have a capacity of 200 gallons of ice cream daily will begin soon.

The Thompson Ice Cream Company also will market pasteurized milk and cream, as well as butter. The company's products will be marketed through local and neighboring town stores. Mr. Thompson says he realizes the necessity of manufacturing only the very highest grade and purest ice cream to meet the demands of the local consumption, and therefore he shall painstakingly follow this policy.

VERNON PLANT LEASED.

J. H. Payne and A. J. Jensen have leased the Vernon ice cream factory and creamery, Vernon, Tex. The plant will be entirely renovated and new equipment installed giving the plant a capacity of 800 gallons of ice cream a day. A new viscolizer, cream cooler, two cream valves and other necessary equipment will be installed to make this plant thoroughly modern and complete. Mr. Jensen is a graduate of Ames University and has had much experience in ice cream and butter manufacturing. Mr. Payne has been working with manufacturers of creamery supplies for several years and will have charge of the business end of the new plant. The name will be changed to the Vernon Ice Cream Plant.

EXPLAIN METHODS TO DEALERS.

The Blommer Ice Cream Co., Kenosha, Wis., recently exhibited methods of mechanical refrigeration to a number of dealers at their plant on Erie street. The Blommer Company has placed a large order for a supply of new-style iceless refrigeration machines and they will be supplied to retail dealers on several plans, where the dealer can either own one or merely use it on a rent plan. Various tests have been made at the Kenosha plant for the past few weeks and William Iserman, local manager, feels confident that the machines will do what is claimed for them.

SCHOOL BOY CHAMPION TRAINS ON ICE CREAM

Young William Lawrence Stribling, 19-year-old Georgia school boy who has made such a sensational record in the pugilistic realm, stopped in Milwaukee long enough last month to tell the newspaper reporters that he is very fond of ice cream. That is, this was told the reporters through his mother, who says that Stribling stays in training all the time and that his parents eat the same food that he does. Ice cream is part of the training diet of this young man who gladdened the hearts of his Georgia friends recently by completely outclassing the world's light-heavyweight champion, Mike Mettigue. Sam Marshall of Albany, secretary of the Georgia Ice Cream Manufacturers' Association, is likely to prevail upon his board of directors to hold one of their quarterly meetings in Atlanta, if everything goes through for the championship fight in that city between Stribling and Mettigue in the summer. Mr. Marshall is almost as much interested in the Georgia ring marvel as he is in the ice cream business.

EVERY MANUFACTURER IN THE COUNTRY SHOULD BE A MEMBER OF THE NATIONAL ASSN. OF ICE CREAM MFRS.

Replies to Inquiries

Dear Sir:—Will you please analyze our mix and offer any criticism you can:

- 24 lbs. 20% cream.
- 8 lbs. 8% condensed milk (Carnation).
- 8 lbs. sugar.
- 12 lbs. 5% milk.
- 2 ozs. ice cream powder.
- 4 ozs. gelatine.

We mix all ingredients in pasteurizer, except sugar and gelatine. This we add when mix is heated to 130 to 140 degrees; hold for 30 minutes; cool down; draw off in 10-gallon cans; hold in cooler for 24 hours or more; freeze at about 15 degrees brine. Perfection freezer. At times we get 10 gallons out of 5 gallons of mix, other times only 8 gallons. The overrun is not regular. However, the specialty seems to be O. K.

Reply: I have written the analysis and you will find the calculations given below in table one where you will find that your mix tests 11½ per cent fat and 34.6 per cent total solids.

Table 1.

Ingredients	Fat	Serum Sol.	Total S.
24.0 lbs. 20% cream	4.80	1.70	6.50
8.0 lbs. 8% evaporated milk64	1.44	2.08
12.0 lbs. 5% milk60	1.01	1.61
8.0 lbs. sugar	7.60
.4 lbs. gel. and improver38
52.4 lbs. mix	6.04	4.15	18.17
Per cent	11.5	7.9	34.6

If I were to suggest an improvement on this mix, I would state that your serum solids is too low. This should be at least 8½ per cent so that your total mix solids would come up to 20 per cent. You are also using a little more sugar than is ordinarily used, being about 15 per cent. I note your method of processing the mix and there does not appear to be anything wrong with your method of processing or freezing. It appears, however, that you are having difficulty with getting a satisfactory overrun at all times and this is undoubtedly due to your method of handling the mix which is probably not uniform from day to day.

If you will give me the butterfat content which you would like to have in your mix and other information, I shall be glad to assist you further in working out more uniform results.

* * *

Dear Sir:—We do not seem to get the proper quality. We make all our ice cream from sweet butter, and pasteurize to 150 degrees and cool to 120 degrees, and run through viscolizer at 3,500 pounds, which goes over to cooler, and then we cool to 35 degrees; then we add our vanilla. We age our mix from 12 to 48 hours. Our mix is as follows:

- 887 lbs. 3% milk.
- 160 lbs. 8% cond. milk.
- 5½ lbs. high grade gelatine.
- 132 lbs. sugar.
- 121 lbs. 84% sweet butter.

Reply: I am glad to show below, in table one, the calculations of your ice cream mix:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
887.0 lbs. 3% milk.....	26.61	76.54	103.15
160.0 lbs. 8% condensed.....	12.80	28.80	41.60
121.0 lbs. 84% butter.....	101.64	101.64
132.0 lbs. sugar	125.40
5.5 lbs. gelatine	5.22
1305.5 lbs. mix	141.05	105.34	377.01
Per cent	10.9	8.0	28.8
Per cent sugar.....	10.04

You will notice that while your mix shows 10 per cent fat, the total solids are low. It is possible that I have made an error in figuring your condensed milk. You did not state whether your condensed milk was the sweetened or the unsweetened milk. If the condensed milk is the sweetened condensed you would, of course, have a larger amount of sugar.

* * *

Dear Sir:—We are using the following recipe in making our ice cream, but we do not seem to get the right overrun:

- 126 lbs. sweet butter churned with an overrun of 20 to 22 per cent.
 110 lbs. sweetened skimmed condensed milk.
 17 lbs. skim milk powder.
 53 lbs. sugar.
 4 lbs. gelatine.
 400 lbs. water.
 Vanilla flavor.

This mix is heated in a vat to 145 to 160 degrees F. and rests in the vat for fifteen minutes, and then run through an homogenizer at 3,500 pounds pressure. It

Don't Overlook Any Bets!
Write today for Free Sample Sheet of
Kunsman's Ice Cream Kartoons

They will help you build business and

Investigate this at once.

KUNSMAN, 29 Reed Street, Reading, Pa.

is cooled in the receiving vat to 40 degrees F. and kept at this temperature from 24 to 36 hours. We freeze in a 40-qt. Cherry freezer with the brine down to 6 and 10 degrees F.

Forty-eight pounds of this mix we figure should give us 10 gallons of ice cream, but we can only get about nine gallons from it. In other words, we plan on getting from this about 150 gallons, but it usually makes 130. There must be something wrong with our formula since we cannot get the proper overrun. Will you kindly figure out the serum solids and total solids, and let us know why we are not getting the proper overrun? Ice cream in this state must test not less than 14 per cent butterfat.

Reply: I am very glad to analyze your ice cream for you. You will find the analysis given below in table one.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
126.0 lbs. 80% butter.....	100.80	100.80
110.0 lbs. sweetened skim cond.	29.70	73.70
17.0 lbs. skim powder	16.15	16.15
53.0 lbs. sugar	50.35
4.0 lbs. gelatine	3.80
400.0 lbs. water
710.0 lbs. mix.....	100.80	45.85	244.80
Per cent	14.19	6.45	34.41
Per cent sugar.....	13.6

You will notice that your mix is pretty well balanced for a 14 per cent ice cream except that you could make an improvement by using a little more serum solids, possibly 7.5 per cent.

I have carefully noted your method of processing the ice cream mix and it appears that you should have no difficulty in getting a satisfactory overrun. I would suggest that while you have an opportunity during the slack season you try to age your mix for 48 hours, keeping it at a temperature between 35 and 40 degrees F. and see if that will not assist you in getting the overrun. Then you might also experiment a little with your freezer during the mix at two or three periods from the freezer. Drawing it first when rather soft, then when frozen a little harder and finally when frozen to the consistency where it will still run easily from the freezer, yet will pile up pretty well in the can.

If in this manner you are not able to solve your overrun problem, it may be necessary to change your formula a little, or your method of processing, but from what you state in your letter this appears to be all right with one exception where you state you heat the mix in a vat from 145 to 160 degrees. Heating it to 160 degrees is too high a temperature and is possibly the cause of your low overrun. I would not heat it higher than 145 degrees.

SOUTHERN CONVENTION—NEW ORLEANS—NOVEMBER 14-15, 1924.

grees, hold it in the vat for thirty minutes and then begin homogenization.

* * *

Dear Sir:—I have made and used for home consumption the following formulas which I find very good. They will not do, however, for commercial purposes as the finished product is too soft to be carried from a store:

Plain Cream—	Fruit Cream—
1 $\frac{1}{4}$ pints cream.	1 $\frac{1}{4}$ pints cream.
1 pint milk.	$\frac{3}{4}$ pint milk.
$\frac{1}{2}$ pound sugar.	1 pound sugar.
2 tablespoonfuls vanilla.	1 quart fruit.

Can you kindly tell me how to change the formulas so as to retain the quality but to make it hard enough to pack so it can be carried from the store?

Also, in your estimation, do you think I could build a business on this type product by charging, say, 80 cents a quart?

Reply: I would suggest that as you want to make ice cream rather rich in butterfat for this special trade and still have it stand up well to be carried away from the store you use the formula given below in table one:

Table 1.

50 lb. mix—for 10 gal. ice cream.
7.0 lbs. sugar.
.25 lb. gelatine (4 oz.).
30.00 lbs. 30% cream.
15.00 lbs. 4% milk.
50.25 lbs. mix—to list 19 to 20% fat.

I see no reason why you could not build up a considerable trade for this kind of product and get a higher price for it.

STOUT

Schroeder—Perfection Cabinets

for 1924 are now ready. Check over your stock and send us your requirements early.

“Insulation is the thing”

JOHN SCHROEDER LUMBER CO.

“A Dozen Cabinets or a Dozen Carloads”

WALNUT ST. MILWAUKEE, WIS.

Dear Sir:—We are having quite a bit of difficulty getting the proper overrun out of our ice cream and we write to ask you for some information. Below we give you our mix:

30 gal. 30% cream.
30 gal. 4% milk.
30 gal. skimmed condensed milk.
5 lbs. gelatine.
126 lbs. sugar.

Temperature for freezing, 6 to 10 degrees above; revolutions of freezers, 198 a minute. We first mix cream, milk and condensed, then the sugar and add gelatine during pasteurization. We heat the mix to 100 degrees, cool to 40 and age for 12 hours. In running our mix we freeze 5 gallons at a time, and are never able to pull over eight gallons of finished product.

Reply: I have your letter of recent date inclosing a statement of your ice cream mix and also stating that you are having difficulty in securing the proper overrun. I have analyzed your mix and you will find the figures given below in table one:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
30 gal. or 249.0 lbs. 30% cream	74.70	15.50	90.20
30 gal. or 255.0 lbs. 4% milk..	10.20	22.00	32.20
30 gal. or 370.0 lbs. cond. skim.	72.90	72.90
126.0 lbs. sugar.....	119.70
5.0 lbs. gelatine.....	4.70
905.0 lb. mix.....	84.9	110.40	319.70
Per cent	9.0	12.2	35.3
Per cent sugar.....	14.0

Your mix, according to these figures, is well balanced, but is possibly a little bit heavy for a 9 per cent butterfat product. You would probably get the overrun just a little easier using a little less milk serum solids. You could do this by using less condensed skim milk. It would, however, not reduce this lower than 11 per cent.

I also notice that you are just aging your mix 12 hours. This is probably the cause of your low overrun more than anything else. I suggest that you try aging a part of your mix 12 hours and a part of it 48 hours and see if that will not assist you in getting the proper overrun. While the mix is being aged at the same time it should not be permitted to go over 40 degrees.

Dear Sir:—I am sending you two formulas which I wish you would analyze for us. We would like a 14 per cent ice cream of good quality.

No. 1—Sugar, 15.5 lbs.; gelatine, 5 lbs.; powdered skim milk, 2 lbs.; 16 per cent cream, 82 lbs.

No. 2—Sugar, 15.5 lbs.; gelatine, 5 lbs.; 8 per cent butterfat, 20 lbs.; condensed milk; 18 per cent sweet cream, 64 lbs.

We get \$1.40 per gallon for ice cream, and we want to make a good quality without the use of a viscolizer.

Reply: Below in table one and table two you will find the calculations made on these two mixes:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
15.50 lbs. sugar	14.72
.50 lbs. gelatine47
2.00 lbs. skim powder.....	1.90	1.90
82.00 lbs. 18% cream.....	14.76	6.03	20.79
100.00 lbs. mix	14.76	7.93	37.88

Table Two.

Ingredients	Fat	Serum Sol.	Total Sol.
15.50 lbs. sugar	14.72
.50 lbs. gelatine47
20.00 lbs. 8% condensed.....	1.60	3.60	5.20
64.00 lbs. 18% cream.....	11.52	4.67	16.19
100.00 lbs. mix	13.12	8.27	36.58

(Continued on page 72)

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Sending out salesmen with "high-water pants"

THEY would be sure to get a laugh and a not very respectful hearing. Ten years ago, salesmen dressed in this fashion would have made a good enough impression — but not today.

Ice cream cartons are salesmen. Their appearance helps or hinders sales. Many cartons now being used have designs which were prepared years ago when the importance of carton-designing was not so thoroly understood. These "high-water pants" designs don't put over their messages quickly or strongly enough. They lose sales.

How about your ice cream carton? Is its design clean, forceful, and sales-compelling? Ask us. Perhaps we can suggest changes that will materially increase its selling value. At any rate it costs you nothing to find out, nor does it put you under any obligation. Write today—enclosing one of your cartons. Sutherland Paper Co., Kalamazoo, Mich.

**Character Cartons
for ICE CREAM**

Our business is the making of paraffined cartons. Designing cartons and suggesting improvements in design is simply one of our services. Write for estimate on duplicating your present carton in any quantity, or for prices and samples of Character Cartons in strikingly original stock designs.

Sutherland Paper Co.

Kalamazoo, Mich.

Makers of Character Cartons for ice cream, butter, bacon, sausage, lard, oleomargarine and cheese

IF YOU KEEP UP WITH OUR ADVERTISERS, YOU KEEP UP WITH PROGRESS.

Both of these mixes should make you a very satisfactory ice cream, and if you are getting \$1.40 a gallon for it I see no reason why you cannot continue these two formulas. Personally, I would prefer the formula as shown in table No. 2. Both of your mixes show 15.5 per cent sugar which is a good deal more sugar than ice cream factories generally use. Fourteen pounds of sugar in 100 pounds of mix is usually considered sufficient sugar.

* * *

Dear Sir:—Will you please give me a formula for ice cream mix, using the following:

Milk, 3.5% fat; cream, 40% fat; sugar, gelatine, flavor; about 12% fat, 14% sugar, 37 to 39 total solids.

Reply: I am glad to suggest below in table one a formula for 100 pounds of mix balanced up properly for a well balanced ice cream:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
14.00 lbs. sugar	13.30
50 lbs. gelatine475
4.00 lbs. skim powder.....	3.80	3.80
25.00 lbs. 40% cream	10.00	1.34	11.34
56.50 lbs. 3.5% milk.....	1.98	4.85	6.83
100.00 lbs. mix	11.98	9.99	35.745

You will notice, however, that the total solids is not as high as you expected it to be and I doubt whether you would want to make an ice cream containing as high as 39 per cent of total solids.

* * *

Dear Sir:—I would like very much to have you analyze the enclosed mix formula, and also suggest a mix using some of the same ingredients, replacing those that are not necessary with other ingredients that will im-

prove the mix and quality of the ice cream. I would like a mix for both sweet cream and butter.

Will you please figure mix so that I can use formula in the states of Michigan, Wisconsin, Indiana and Illinois.

Fifty Gallon Mix.

264 lbs. 3.5 per cent milk.

40 lbs. sweet butter taken from churn before salting.

80 lbs. cond. milk fresh, B. F. percentage not known.

50 lbs. sugar.

40 lbs. glucose syrup.

4 lbs. gelatine.

2 lbs. Ice cream powder.

1/2 lb. meloine. (B. Heller & Co. brand).

The 264 pounds of milk is heated hot enough to dissolve the butter. The 80 lbs. of condensed milk is the added. Sugar and ice cream powder are mixed together and added; glucose syrup is next. Gelatine is then dissolved in hot water and added. Meloine is put into the day of freezing.

The mix is pasteurized at 150 degrees, held for 10 to 15 minutes, and viscolized a few degrees lower than that at 2,000 to 2,500 pounds, and cooled immediately. Mix is aged 24 hours at 38 to 40 degrees until frozen.

Reply: I have analyzed the enclosed mix and you will find the calculations given below in table one:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
264.00 lbs. 3.5% milk.....	9.24	22.67	31.91
40.00 lbs. 84% butter.....	33.60	33.60
80.00 lbs. condensed	6.40	24.40	20.80
50.00 lbs. sugar	47.50
40.00 lbs. glucose	24.00
4.00 lbs. gelatine	3.80
2.00 lbs. ice cream powders..	1.90	1.90
.50 lbs. Meloine
480.00 lbs. mix	49.44	42.77	163.51
Per cent	10.26	8.9	34.07

You called this mix the Michigan mix. You will notice that according to the analysis this mix tests about 10 per cent fat, but is a little low in milk serum solids. There is also no reason why glucose should be used instead of using all cane sugar. However, this mix should make a fairly good quality of ice cream. You have probably noticed many times that I have been recommending at least 10 per cent milk serum solids when 10 per cent butterfat is being used.

You wanted me to suggest a formula for you, using sweet milk and also using butter. Before I can do this for you if you will suggest what the per cent butterfat would be in your sweet cream and also if you will have some whole milk available which you will undoubtedly have and what the test of this whole milk would be. It would hardly be advisable for me to suggest a mix for you which could be used in the various states as your local competition would probably have a great deal to do with the kind of mix and quality of ice cream you would want.

If you will give me all the possible details that you might have in making up your mix I shall be glad to assist you in any way further I can and try to teach you the methods for calculating the fat and solids.

If you desire to purchase a book on ice cream I suggest that you buy "The Book of Ice Cream," by Fisk. You can order this book through The Olsen Publishing Co., 5th and Cherry Sts., Milwaukee, Wis.

DISTRIBUTORS IN ALL PRINCIPAL CITIES

mix: 100 pounds 16 per cent cream, 7 pounds milk powder, 19 pounds sugar, .75 pounds gelatine.

Reply: You will find these calculations given below in table one:

Ingredients		Table 1.		
		Fat	Serum Sol.	Total Sol.
100.00 lbs.	10 % cream.....	16.00	7.48	23.48
7.00 lbs.	skimmilk powder..	6.65	6.65
19.00 lbs.	sugar	18.05
.75 lbs.	gelatine71
126.75 lbs.	mix	16.00	14.03	48.89
Per cent	12.6	11.4	38.3
Per cent sugar.....	15.00

This mix should make you an excellent quality of cream, except that possibly you are using just a little too much gelatine according to your total solids. It would also not be necessary to use quite as much sugar. That is, of course, a matter for you to decide depending upon how you have worked up your trade.

If you should like to change this formula, reducing the amount of sugar and gelatine, I shall be glad to assist you.

Relative to the use of dried buttermilk for ice cream, this would not be advisable in any case, even if the dried buttermilk were comparatively sweet. This product would not go into a true solution in your mix and is out of the question for that purpose.

Dear Sir:—The plant I am working in has the following mix, from which they get about 90 per cent overrun. They seem to be well satisfied with the product. It consists of 140 gallons whole milk, not less than 3.5; 70 gallons S. H. 8% condensed; 70 gallons 30% cream; 400 lbs. sugar; 4 gallons gelatine; 2 lbs. ice cream improver. As to how they arrived to this amount of gelatine no one in the plant seems to know. The former ice cream maker used this amount. The method they use in putting this mix together: They have a 300 gallon Cherry coil vat. They empty 140 gallons of milk, dump 400 lbs. of sugar, and put gelatine in while cold. Then heat this to 140 degrees, then they add the 70 gallons of cream, which cools the mix in vat back to about 120 degrees. Then they run it through a viscolizer at 2,000 pound pressure, and over a tubular cooler, which cools it back to 50 degrees. It is then run into the vat, and cooled back to 40 degrees. Then they add the 70 gallons of S. H. condensed. This makes a mix of 300 gallons. Recently I froze this amount of mix, making vanilla, chocolate and strawberry. I filled 40 8-quart brick slabs. I got 560 gallons of cream out of the 300 gallons of mix. I was using two Miller freezers, with 6 degree brine.

Reply: I have made an analysis of your ice cream and the calculations are shown below in table one:

Ingredients		Table 1.		
		Fat	Serum Sol.	Total Sol.
140 gal. or 120.4 lbs.	3.5 % milk	42.14	103.42	145.56
70 gal. or 616.0 lbs.	8 % cond..	49.25	110.88	160.16
70 gal. or 581.0 lbs.	30 % cream	174.30	36.28	210.58
400.0 lbs.	sugar.....	380.00
13.5 lbs.	gelatine.....	12.82
2.0 lbs.	improver	1.80
2816.5 lbs.	mix	265.72	250.58	910.92
Per cent	9.4	8.9	32.3

I was hardly able to understand what you meant in your letter when you stated you used four gallons of gelatine in the mixture. The amount of gelatine which should be required for this mix would be about 13.5 pounds and this would not make up four gallons unless the gelatine is dissolved in four gallons of water. If you can give me better advice on this amount of gelatine I can analyze your formula for you in better detail.

You will also notice that in changing the gallons to

Speedy Can Handling Increases Net Profits

Here's the quick way to handle your "empties" before and after washing. By keeping them on Nutting Trucks they are compactly stored and ready to move instantly. This method saves time, reduces handling costs and increases profits.

Nutting

ICE CREAM CAN TRUCK

is the strongest made. Its well-braced, heavily riveted structural steel construction insures longer, better service and freedom from trouble and repairs. The entire frame is galvanized.

Easy running. Balance type. Large $8\frac{1}{4}$ inch main wheels, with a wide $2\frac{1}{2}$ inch flat face to save floors. **Ball bearing** swivel casters.

Convenient. Dirty cans are piled slanting upwards to keep contents from spilling. Washed cans are piled slanting downward for quick draining. Wood bars on platform prevent denting of cans. High railing on top holds all covers.

Price Fig. 106 (30x66 in.) Top rail included. F. O. B. Faribault or Chicago, \$52.00.

(less without cover-holding top rail.)

Order from your jobber or write us for Bulletin C-6 which describes and illustrates this and other floor trucks for the dairy industry.

pounds I arrived at a total number of 2816.5 pounds, while three hundred gallons of mix would not weigh more than 2,700 pounds. This mix as I figured it would make three hundred thirteen gallons and if you froze five hundred sixty gallons of ice cream from this the overrun would be 78 per cent. The processing of the mix appears to be all right, except that I am sure better results would be obtained if all the ingredients were put into the mix and viscolized rather than leaving out the seventy gallons of condensed.

* * *

Dear Sir:—You have given us such valuable information before that we are asking you to favor us with an analysis of the three following formulas. We are mixing in a ten gallon can:

Mix No. 1.

2 gal 40% sweet cream.
 $2\frac{1}{2}$ gal. 42% serum solids plain skim condensed.
8 ounces of gelatine.
13 lbs. sugar.
Balance water to fill ten gallon can.

Mix No. 2.

$2\frac{1}{2}$ gal. 40% sweet cream.
 $2\frac{1}{4}$ gal. 42% serum solids plain skim condensed.
8 ounces gelatine.
13 pounds sugar.
Balance water to fill ten gallon can.

Mix No. 3.

$2\frac{1}{2}$ gal. 40% sweet cream.
 $2\frac{1}{2}$ gal. 42% serum solids plain skim condensed.
8 ounces gelatine.
13 pounds sugar.
Balance water to fill ten gallon can.

Now, mix No. 1 is the cheapest to make up and we do not notice much difference in the flavor of Mix No. 1 and Mix No. 2. We have cheap competition down here and have to cut the cost of our mix all we can. After you analyze Mix No. 1 please advise if we should use more condensed so as to get 100 per cent overrun.

Reply: You will find the analysis of these mixes given below in tables one, two and three:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
16.0 lbs. 40% cream	6.4	.86	7.26
23.0 lbs. plain cond. skim 42%		9.66	9.66
13.0 lbs. sugar			12.35
.5 lbs. gelatine47
35.5 lbs. water
88.0 lbs. mix	6.4	10.52	29.74
Per cent	7.27	12.0	33.8
Per cent sugar	14.79

Table 2.

20.0 lbs. 40% cream	8.0	1.07	9.07
20.7 lbs. 42% cond. skim		8.69	8.69
.5 lbs. gelatine47
13.0 lbs. sugar			12.35
33.8 lbs. water
88.0 lbs. mix	8.0	9.76	30.50
Per cent	9.09	11.09	34.7

Table 3.

Ingredients	Fat	Serum Sol.	Total Sol.
20.0 lbs. 40% cream	8.0	1.07	9.07
23.0 lbs. 42% cond.		9.66	9.66
.5 lbs. gelatine47
13.0 lbs. sugar			12.35
31.5 lbs. water
88.0 lbs. mix	8.0	10.73	31.55
Per cent	9.09	12.19	35.8

You will notice that your mix according to table one tests only a little better than 7 per cent fat, but the

Folks are Learning, Mr. Manufacturer, What

HEATHIZED

Means to Ice Cream

The people have awakened to a new appreciation of the advantages of a better ice cream.

Some years ago they learned that packaged foods, protected from the air, were more desirable than bulk goods.

So when we told the people we were keeping air out of ice cream, they realized that HEATHIZED ICE CREAM was cleaner and better.

People have also learned that air is the foe of vitamins, while Heathization protects these essential elements of health and growth in HEATHIZED ICE CREAM.

You may think people don't know the difference between HEATHIZED ICE CREAM and the ordinary commercial ice cream. But they do. An evergrowing following is demanding HEATHIZED ICE CREAM from our clients' dealers.

They may not have told you that they do, but the hundreds of thousands of gallons added to our business tell us that they seek the dealers who display the HEATHIZED sign.

We shall be glad to establish any clean, reliable manufacturer as a Heathized agent, provided he is not too close to one of our clients already established.

For full particulars write to

Heathized Products Company

The New Era Co.

146 MERRITT STREET
Oshkosh, Wis.

total solids is about 12 per cent. You will also notice that the sugar content is very near 15 per cent. Your mixes Nos. 2 and 3 are 9 per cent butterfat mixes and mix No. 3 is the highest one in serum solids and total solids.

I would not advise you to use more of the plain condensed skim milk in either one of the formulas, as you would be liable to have trouble with sandy ice cream. Personally, I like your mix in table No. 2. You should also have no difficulty in getting 100 per cent overrun with the mix either of table two or three.

* * *

Dear Sir:—The process we use in making mix is as follows: We use whole milk and sweet butter mixing it in a Manning pasteurizer and running it through a small emulsifier. We like about a 15 per cent butterfat content, 12 per cent sugar, using beet sugar, whole milk testing 3.5 per cent, and sweet butter.

Reply: I am suggesting below in table one how your mix would analyze.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
12.0 lbs. sugar	11.40
.5 lbs. gelatine47
15.0 lbs. 84% butter	12.60	12.60
72.5 lbs. 3.5% milk	2.53	6.23	8.76
100.0 lbs. mix.	15.13	6.23	33.23

You will notice that the percent of fat would be 15 and the milk serum solids about 6 per cent. This will make you a fairly satisfactory ice cream.

I am suggesting, however, that you put all the ingredients together including the sugar and gelatine and emulsify the entire mix. This will give you better results than if you emulsified just the butter and milk and add the sugar and gelatine later. You could also improve your mix by using 2 pounds more sugar cutting off 2 pounds from the amount of milk. This would still make 100 pounds of mix and would test 15 per cent.

* * *

Dear Sir:—We are experiencing some difficulty with our orange ice, it becoming very hard and unsalable within one or two days after it has been packed in dealer's cabinet. We are wondering if you can assist us in solving our problem. We are making our orange ice according to the following formula:

26 pounds sugar.
1½ ounces orange emulsion.
½ ounces lemon.
7 ounces 50 per cent citric acid.
1 ounce color.
4 ounces textor.

With enough water to make 10 gallons.

Reply: You stated that the ice became hard and unsalable within one or two days when handled in a dealer's cabinet.

If I were to make a suggestion to improve your sherbet formula I would reduce the amount of sugar from 26 pounds to 20 pounds, use probably just a little less citric acid and use from four to six ounces of gelatine cutting down the textor to about two ounces. This will make an ice with a little less solids than what you have now, but it will be a little easier to keep in the dealer's cabinet.

Your dealers should also be instructed in the proper care of a sherbet or a water ice. An ice is much harder to keep in good condition and requires a lower temperature and more frequent re-packing than an ice cream.

I believe that if your dealer has proper instructions and you will change your formula so that you will have a little less solids and will introduce a little more gelatine to give a good stabilizer to the product you should be able to overcome this difficulty.

120-qt. motor - driven
EMERY - THOMPSON
horizontal brine freezer
with automatic batch
regulator valve. Rais-
ing hand lever at for-
ward end of cylinder
permits instant exami-
nation of batch.

The Thoroughbred of Its Kind

The New *EMERY-THOMPSON BRINE FREEZER* is the *thoroughbred of its kind*.

It embodies such improvements as automatic batch control valve; open and full space for brine circulation through the base of the vertical freezer and through the entire back of the horizontal freezers; true nickel silver cylinders on which scrapers run smoothly; and other fundamental improvements which have made *EMERY-THOMPSON Brine Freezers* the preferred method of ice cream manufacture.

OUR regulation brine tank, shown below, is intended for freezers of not over 40 quart capacity. It is very economical in operation, sufficient brine being cooled for the freezer at the lowest possible cost. 1" open impelled centrifugal pump gives an even, steady flow. Furnished with flexible closed couplings.

The hinging of the heads; full bronze bushings; cut steel gears; and the elimination of soldered ends are features so important that no manufacturer can afford to overlook them.

EMERY-THOMPSON brine circulating backs alone add about 10% to their refrigerating qualities. And the *EMERY THOMPSON* automatic batch control valve which accurately measures each batch will *save*

a big yearly cream loss through overflowing reservoirs and uneven over-runs.

Why pay experienced men high wages and limit their production with slow, inferior freezers? The *EMERY-THOMPSON* in your plant *will save its cost* many times over in *reduced cost-per-gallon*, better cream, and bigger sales. It will pay you to ask us for prices and further details.

BLISSFIELD, MICHIGAN

AN ARITHMETICAL METHOD OF BALANCING THE SERUM SOLIDS IN THE ICE CREAM MIX.

(Continued from page 34)

III-A.

One Hundred Pound Mix—11% Fat, 11% Serum Solids, 13% Sugar, .4% Gelatine.

Using Cream, Skim Milk, and Whole Unsweetened Condensed Milk.

Determine Amount Whole Unsweetened Condensed Required.

13.00 lbs. sugar	Fat 11.00 lbs.	S. S. 11.00 lbs.
11.00 lbs. fat		
.40 lbs. gelatine		
75.60 lbs. skim milk		6.7284

100.00 lb. Mix	11.00	4.2716
----------------	-------	--------

Dividing our shortage of 4.2716 pounds serum solids by our factor .11812 we find we need to add 36.163 pounds of condensed. 36.163 pounds of condensed would contain 2.893 pounds of fat, reducing our fat to be obtained from cream to 8.10696 pounds. Using 30% cream, 27.926 pounds of cream will supply the 8.107 pounds of fat.

III-B.

To Complete and Prove Mix.

100.00 lb. Mix	Fat 11.00 lbs.	S. S. 11.00 lbs.
13.00 lbs. sugar		
.40 lbs. gelatine		
27.026 lbs. 30% cream	8.1078	1.6837
36.163 lbs. cond.	2.89304	7.2326
23.411 lbs. skim milk		2.083579

100.00 lb. Mix	11.0008	10.999879
----------------	---------	-----------

Thirty-six pounds is rather high on condensed and it would probably be better to use about 25 lbs. of condensed and complete mix as illustrated in Problem VI.

Problem IV.

Mixes Using Sweetened Condensed Skimmed.

The Factor for Sweetened Condensed Skimmed is .21846.

Sweetened condensed skim analyzes 40% sugar and 27% serum solids. One pound sweetened condensed increases serum solids 27%. It contains 40% sugar solids, which is equal to .40 lb. ÷ .95 × 100 or .421 lb. of 95% sugar. Since the sugar replaces a part of the sugar requirement and does not change the quantity of skim milk, one pound of condensed milk replaces 1 minus .421 sugar or .579 pounds of skim milk which contains .951531 pounds solids. So .27 — .051531 gives the factor .218469.

$$1 \text{ lb. cond.} \times .27 = .27$$

$$.579 \text{ lb. skim milk} \times .089 = .051531$$

.218469 factor.

IV-A.

One Hundred Pound Mix—11% Fat, 11% Serum Solids, 13% Sugar and .4% Gelatine.

Using Cream, Skim Milk and Sweetened Condensed Skimmed.

Determine Amount Sweetened Condensed Skimmed Required.

	Lbs. Fat	Lbs. Sugar	Lbs. S. S.
100.00 lb. Mix	11.00	12.35	11.00
13.00 lbs. sugar × 95%		12.35	
.40 lbs. gelatine			
11.00 lbs. fat	11.00		
75.60 lbs. skim milk			6.7248

100.00 lb. Mix	11.00	12.35	4.2716 short
----------------	-------	-------	--------------

Between the 11 lb. serum solids required and the 6.7248 lb. contained in the skim milk there is a shortage of 4.2716 pounds serum solids. Dividing 4.2716 by the factor .21846 we find the mix will exactly balance with 19.55 pounds of sweetened condensed. 19.55 pounds of sweetened condensed contains 7.82 pounds sugar solids. 7.82 pounds sugar solids are equal to 8.23 pounds of 95% sugar. 13—8.23 leaves 4.77 pounds sugar, required to make 13% sugar in the mix.

IV-B.

To Complete and Prove Mix.

	Lbs. Fat	Lbs. Sugar	Lbs. S. S.
100.00 lb. Mix	11.00	12.35	11.00
4.77 lbs. sugar		4.5313	
.40 lbs. gelatine			
36.66 lbs. 30% cream	10.998		2.28374
19.55 lbs. sweetened cond.		7.82	5.2785
38.62 lbs. skim milk			3.43718

100.00 lb. Mix	10.998	12.3513	10.99942
----------------	--------	---------	----------

I. C. R. 6

Problem V.

Mixes Using Whole Sweetened Condensed.

One pound of whole sweetened condensed contains 8% or .08 lb. fat, 40% or .40 lb. sugar and 20% or .20 lb. serum solids. .40 lb. sugar solids is equal to .421 of 95% sugar. .421 lb. sugar+.08 lb. fat will make .501 lb. of the condensed which replaces the fixed ingredients fat and sugar and does not affect the amount of skim milk in the mix. So subtracting .501 from 1 leaves .499 pounds of skim milk which 1 lb. of condensed displaces. .499 of a pound of skim milk contains $.499 \times .089 = .044411$ of a pound serum solids.

One pound of condensed contains .20 serum solids and displaces .044411 of serum solids in the form of skim milk, so each pound whole sweetened condensed used represents a net gain in serum solids of .20 — .044411 or .155589.

1 lb. condensed \times 20% serum solids = .20 lb.
.449 lb. skim milk \times 8.9% = .044411

.155589 factor.

V-A.

One Hundred Pound Mix—11% Fat, 11% Serum Solids,
13% Sugar, .4% Gelatine.

Using Cream, Skim Milk and Whole Sweetened
Condensed Milk.

Determine Amount of Whole Sweetened Condensed
Required.

	Lbs. Fat	Lbs. Sugar	Lbs. S. S.
100.00 lb. Mix	11.00	12.35	11.00
13.00 lbs. sugar \times 95		12.35	
11.00 lbs. fat	11.00		
.40 lbs. gelatine			
75.60 lbs. skim milk			6.7284
100.00 lb. Mix	11.00	12.35	4.2716 short

There is a shortage of 4.2716 lbs. serum solids. $4.2716 \div .155589 = 27.454$ lbs. condensed which it will be necessary to add.

V-B.

To Complete and Prove Mix.

27.454 lbs. condensed are required. 27.454 will contain 40% or 10.9816 pounds sugar solids, equivalent to 11.558 pounds of 95% sugar. 13 — 11.558 leaves only 1.442 pounds sugar required. 27.454 pounds condensed at 8% will contain 2.19632 pounds fat. 11 — 2.19632 leaves 8.80368 pounds fat required which amount is supplied in 29.3456 pounds of 30% cream.

	Lbs. Fat	Lbs. Sugar	Lbs. S. S.
100.00 lb. Mix	11.00	12.35	11.00
1.442 lbs. sugar \times 95%		1.369	
40 lb. gelatine			
29.345 lbs. 30% cream	8.8035		1.828
27.45 lbs. cond.	2.196	10.98	5.49
41.359 lbs. skim milk			3.68
100.00 lb. Mix	10.99986	12.349	10.998

Problem VI.

Mixes Using Given Amount of Condensed and Completed
With Skim Milk Powder.

One Hundred Pound Mix—11% Fat, 11% Serum Solids,
13% Sugar, .4% Gelatine.

Using Butter, Skim Milk, 16 lb. Sweetened Condensed
Skimmed, and Skim Milk Powder.

Determine Amount of Skim Milk Required.

Sixteen pounds condensed skim milk at 40% contains 6.40 pounds sugar solids. 6.40 pounds sugar solids are equal to 6.73 pounds of 95% sugar. 13 minus 6.73 leaves 6.27 pounds sugar to be added.

	Lbs. Fat	Lbs. Sugar	Lbs. S. S.
100.00 lb. Mix	11.00	12.35	11.00
6.27 lbs. sugar \times 95%		5.956	
.40 lbs. gelatine			
13.00 lbs. butter	11.004		
16.00 lbs. cond. skim milk		6.40	4.32
64.23 lbs. skim milk			5.716473
100.00 lb. Mix	11.004	12.35	10.0364

As the mix stands the serum solids are 10.0364, a shortage of .9636 pounds. .9636 divided by .861 (factor for skim milk powder) shows that 1.118 pounds of powder are required.

"GMC trucks are seven steps ahead"

GMC Meets Every Requirement of Satisfactory Ice Cream Delivery

With a surplus of pulling power beyond its rating and extra strength in every chassis part, GMC is able to deliver its cargo day after day over all kinds of roads and grades. Moreover, GMC has a speed on good roads that assures the greatest possible daily mileage. And, combined with this power and speed is the economy of operation and maintenance that only GMC can offer.

GMC trucks offer unsurpassed efficiency in every field of hauling service. When extra power is necessary to move an exceptionally heavy load or when grades and heavy hauling call for an extra pull, GMC can supply the surplus necessary. On long trips and on good roads when time is a deciding factor, GMC can travel just as fast as is safe for a truck of its size and weight. And, with these profit-building advantages GMC combines an economy of operation and maintenance that enables GMC to work under conditions impossible to other trucks.

If you are a truck owner or you are interested in hauling and delivery in any sort, you will want to read about GMC design and construction and a detailed description of GMC special features. A free, illustrated booklet on these has been prepared and this with the GMC catalogue will tell you a great deal more about these profit-making trucks. Fill out and mail the coupon today.

NATIONAL CONVENTION—NEW ORLEANS—NOVEMBER 17-20, 1924.

VI-B.

To Complete and Prove Mix.

	Lbs. Fat	Lbs. Sugar	Lbs. S. S.
100.00 lb. Mix	11.00	12.35	11.00
6.27 lbs. sugar X 95		5.956	
.40 lbs. gelatine			
13.10 lbs. butter	11.004		
16.00 lbs. cond skim milk		6.40	4.32
1.118 lbs. skim. powder			1.0621
63.112 lbs. skim milk			5.6170
100.00 lb Mix	11.004	12.35	10.9991

There is one more step to consider. Multiplication is a simpler process than division. The factors can be changed so that instead of dividing by a factor, we multiply by a factor.

In the case of skim milk powder the factor to be divided by is .861. If .861 is divided into 1 a factor 1.1616 is obtained. In problem I-A we had a shortage of 4.2716 pounds of serum solids. We divided by .861 and found that the mix balanced correctly by adding 4.96 pounds of powder. It would have been more rapid to have multiplied by 1.1616 or (1.162) and the result is the same, 4.96.

Similarly converting each of the other three factors by dividing into 1:

.11812 becomes 8.466.
.21846 becomes 4.5775.
.155589 becomes 6.427.

The calculations of the factor may appear rather difficult, but such calculations are presented merely for information. It is necessary only to remember four factors and the method of making use of them in calculating the mix. It will not be necessary in general practice to use more than the first three decimals of the factors. The results obtained will be as accurate as it is possible to weigh. Four factors have been calculated.

	divided by	or	multiplied by
95% S.S.861		1.1616 (1.162)
Whole unsweetened condensed			
20% S.S. 8% fat.....	.11812	(.118)	8.466 (8.47)
Sweetened condensed skimmed			
27% S.S. 40% sugar.....	.21846	(.218)	4.5775 (4.58)
Sweetened whole condensed			
27% S.S. 40% S. 8% fat..	.155589	(.155)	6.427 (6.43)

TAG HOOKS

Save Dollars

Why use expensive, untidy, time-losing strings or wires while tagging your tubs or pails of ice cream?

SNAP 'EM ON

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Owing to the rather wide variation in composition of whole unsweetened condensed the following factors for condensed having a composition of 18% serum solids and 4% fat is given:

Whole unsweetened condensed divided by or multiplied by
18% S.S. 8% fat09812 10.2

Illustrating use of multiplication factor 1.16 for skim milk powder.

Mix to analyze 11% fat 11% serum solids 12% sugar .4% gelatine.

On retest a 4,000 lb. mix was 11.5 fat and 33.77% total solids.

The total solids would be 11% fat, 11% S. S., 11.4% sugar solids and .37% gelatine solids. A total of 33.77.

4,000 times 11.5 equals 460 lbs. fat.

460 pounds of fat will make 4.181 pounds of 11% fat. 460 divided by 11 times 100 equals 4181 pounds.

4,000 times 11.5 equals 460 lbs. fat

4,000 times 33 equals 1320

4,000 lbs. mix 460 lbs. fat 1320 lbs. total solids.

4181	(11 fat)	
33.77 T. S.	460	1411.92
	000	91.92 shortage T. S.

The fat is correct but there is a shortage of 91.92 pounds of solids for the 4181 pound mix. We add sugar and gelatine solids as follows:

181 lb. mix. 12% sugar equals 21.7 lbs. times 9% equals 20.61 lbs. sugar solids. .4% gelatine equals .72 lbs. times 95% equals .68 lbs. gelatine solids.

Add skim milk to make 181 pounds and calculate balance solids.

Skim milk equals 158.58 lbs. times 8.9% equals 14.11 lbs. —181.00 lbs. mix: 35.40 lbs. solids. 91.92 minus 34.51 leaves a shortage of 56.52 pounds of serum solids.

This mix can now be completed with skim milk and material high in serum solids but containing no fat as the mix is already balanced as to fat. Use the factor for either skim milk powder or sweetened condensed skimmed. The factor for skim milk powder is 1.16. 56.52 times 1.16 equals 65.56 pounds of powder.

4000.00 lb. Mix 460.00 lbs. fat 1320 lbs. solids

21.7 lbs. sugar		20.61
.72 lbs. gelatine		.68
65.56 lbs. skim milk powder		62.28
93.02 lbs. skim milk		8.278

4181.00 lb. Mix	460.00 lbs. fat	1411.84
460	1411.84	
equals 11% fat	equals 33% total solids.	
4181	4181.00	

Positively.

The safety committee has sent out a warning to ladies visiting the country in short skirts to keep out of the cow pastures. The reason for said warning is that strange calves often excite a cow's anger, and there are some strange ones.—Burr.

BARBER

Everything for the Dairy Industry

The American Kron Scale

*Just Load
and Look*

WITH modern methods of making ice cream mix it is highly essential to have speedy, accurate, and practical weighing apparatus.

Speedy—to handle large batches in limited time; its action is instantaneous; it saves half or more of your weighing time.

Accurate—so that you will know that each batch contains the proper amount of each ingredient.

Practical—so that it will save labor, simplify the recording of weights, and lower your weighing costs.

The KRON Scale gives you *all* of these advantages, and speeds up the entire plant. It has no springs to put it out of adjustment. Its uncanny accuracy eliminates the possibility of dispute, and removes your weighing worries once for all.

If you will tell us briefly the capacity of your plant and your weighing requirements we shall be glad to recommend the proper KRON equipment for your use and tell you exactly what it will cost you.

Accumulative Indicator

AN added and exclusive feature of the KRON Scale. Not necessary to add the separate weights—the second indicator does that for you automatically, and instantly, always giving the total at a glance. Saves work, eliminates mistakes; avoids disputes.

*There's a KRON Scale Exactly Fitted to
Your Needs—Let us Tell You About It*

line in Chart IV measures the quality of flavor using the score card suggested by Fisher and Judkins. The horizontal line represents the per cent of butterfat or total solids contained in the different batches. A study of the chart reveals the fact that up to 12 per cent butterfat there is a great improvement in flavor. From 12 to 16 per cent the improvement in flavor continues but much slower, while above 16 per cent there is a tendency to get too rich a taste for a good many people. Solids-not-fat on the other hand have no effect on flavor except that beyond 12 per cent there is marked tendency to develop undesirable condensed, lactose and cooked flavors. Chart V shows the influence of butterfat and

Chart No. 4

solids-not-fat on the body and texture of the finished ice cream. With every per cent increase in solids-not-fat from 6 to 10 per cent, there was a corresponding improvement in body and texture. From 10 to 12 per cent there was no improvement and over 12 per cent injured the body and texture by producing a soggy body with great tendency to become sandy. An increase of butterfat on the other hand failed to show any material improvement in body and texture until at least 16 per cent was used.

THE conclusions that may be drawn from these series of trials are: That up to about 12 per cent butterfat greatly improves the flavor. It gives the ice cream that delicate pleasing flavor and aroma which it is impossible to get unless the butterfat is present. Whether or not it would pay commercially to have an ice cream with over 12 per cent is a question, depending upon market and cost of butterfat, but certainly up to 12 per cent butterfat is a good investment and business builder.

With reference to serum solids the results show conclusively that a certain amount of additional serum solids are needed to produce the desirable body and texture. There is, however, no advantage to increase the serum solids over 10 per cent for beyond this point there is a great danger of injuring flavor by producing cooked or caramelized flavors.

As to the most desirable proportion or relation of fat to serum solids the results of these trials indicate that the best blend is obtained with 12 per cent fat, 1 per cent serum solids, 14 per cent sugar and 0.3 to 0.5 per cent gelatine. With these proportions the delicate flavor and aroma derived from the butterfat was charac-

SOUTHERN CONVENTION—NEW ORLEANS—NOVEMBER 14-15, 1924.

teristic while at the same time the body and texture was firm, smooth and velvety as a result of the added solids.

AT VARIOUS times last year the ice cream journals have published data as to observations on relation of acidity to ice cream quality. To further study this point a series of trials were made in which all mixes were of uniform composition and made up of the same basic materials. The composition of mixes used were

Chart No. 5

12 per cent butterfat, 10 per cent serum solids, 14 per cent cane sugar and 0.3 per cent gelatine. Fresh milk and cream of highest quality only was used, while skim milk powder was used to supply additional serum solids as it was easier to maintain uniform conditions.

The acidity of these series of trial mixes, all of which were of the same composition and basic materials, was then varied to range from 0.1 to 0.50 per cent of one per cent. In order to produce some of the lower acidities around 0.1 to .16 per cent it was found necessary to reduce the acidity. This was done by adding a 20 per cent solution of sodium bicarbonate. The solution was thoroughly boiled and added in proper amounts to the cold milk products, before sugar and gelatine was added. The mix was then brought to pasteurizing temperature and the sugar and gelatine added at this point. Sugar and gelatine should not be added to the cold mix to which the soda solution is added as it tends to produce a heavy viscogen like body.

To obtain the higher acidities the mix was allowed to ripen at 65 degrees F. until the desired acidity was reached when they were at once cooled to 45 degrees F. In some of the higher acidities of 0.4 per cent and over, pure culture of lactic acid starter was added. The batches were frozen into vanilla ice cream and then scored for flavor or palatability. The series of trials was repeated ten times, making a total of 90 batches on which observations were made. The average results were plotted and are represented on Chart 5. The vertical line again measures the flavor or palatability while the horizontal line shows the per cent of acidity in the different batches. Beginning with the exceedingly low acidity of 0.1 per cent the flavor improved until an acidity of about .15 per cent was reached. The highest scores were received by samples having an acidity ranging from 0.15 per cent to 0.20 per cent. From 0.20 per cent to 0.25 per cent there was a slight deterioration in flavor but all mixes with an acidity of over 0.25 per cent rapidly fell in score.

The results are strikingly in favor of low acidity from a flavor standpoint. In the mixes with an acidity of much over 0.20 per cent there was lacking the delicate blend of flavor and aroma characteristic of the high quality product. Some ice cream manufacturers seem to have gained the impression that because it is possible

Chart No. 6

to reduce the acidity, little attention needs to be paid to the original acidity. This is absolutely wrong and such policy is bound to give disastrous results. It is impossible in a high acid mix to bring back the delicate flavor and aroma of fresh cream and as a matter of fact the acidity of a mix cannot successfully be reduced much over 0.1 of one per cent.

In view of the above results it certainly is a good and profitable business to keep the natural acidity of milk

EVERY MANUFACTURER IN THE COUNTRY SHOULD BE A MEMBER OF THE NATIONAL ASSN. OF ICE CREAM MFRS.

products as low as possible. This means careful selection of the raw products such as milk, cream and condensed milk. It further means proper care in processing, cooling and holding the mix so as to prevent the development of acidity. Holding a mix over 24 hours is to be discouraged and all mixes should be held at 45 degrees F. or below.

IT HAS been a matter of common observation and experience that mixes although of the same composition and run through the homogenizer at the same pressure will vary materially in body or viscosity. It was

Chart No. 7

believed that acidity was largely responsible for this varying viscosity and a series of trials were run in order to study this point.

In this case all batches were of the same composition, namely, 12 per cent fat, 10 per cent serum solids, 14 per cent cane sugar and 0.3 per cent gelatine. The whole mix was homogenized in each case at 3,000 lbs. pressure and at a temperature of 120 degrees F. The only varying factor was the acidity which ranged from 0.1 to 0.5 of one per cent. The viscosity was determined immediately after homogenizing as the mix came from the cooler. Chart 6 shows the results of these series of the trials. The vertical line in this case represents the relative viscosities, while the horizontal line represents the acidity of the different mixes. The broken line represents what in the judges' opinion constitutes the most desirable viscosity of an ice cream mix. A study of the chart shows that the two lines cross each other at about 0.21 per cent acidity, indicating that for a mix of 0.21 per cent acidity and of the composition as used in these

trials, 3,000 lbs. results in about the proper viscosity. It further shows that the viscosity of the mix increases as the acidity increases, all other factors remaining the same.

Another series of trials were then started to study the relation between acidity and homogenizing pressure and the pressure to use with varying acidities. A series of batches used were of the same composition as outlined above, but the batches were varied in acidity from 0.16 up to .32 per cent. Each batch was then run through the homogenizer at various pressures ranging from 1,000 pounds to 5,000 pounds. The results are graphically reported on Chart 7. The horizontal dotted line again marks the proper degree of viscosity to be desired in the ice cream mix, the vertical line measuring the viscosity and the horizontal direction shows the pressure at which the different batches were run through the homogenizer.

In studying the chart it is striking that in each case the higher the acidity the lower was the pressure needed to give the proper viscosity. Thus with an acidity of 0.16 per cent a homogenizing pressure of 4,000 pounds gave excellent results, but 4,000 pounds pressure for the same mix with an acidity of .24 per cent resulted in too heavy a body, while the same mix with an acidity of 0.32 per cent failed to run over the cooler because of the heavy cheesy body. These results seem to explain at least one important factor as to why the body of the mix may vary materially from day to day and why sometimes too heavy a viscosity is obtained. In general the mixes with an acidity ranging from .16 to 0.20 per cent gave best results with a corresponding higher homogenizing pressure as the acidity decreased. This, however, does not necessarily mean that it is always advisable to use 4,000 pounds pressure with an 0.16 per cent acidity mix.

Other factors, such as cost of power, rapid rate of deterioration of machine with high pressure, composition of the mix, nature of the solids as to source of butterfat and serum solids, all must be considered in deciding what pressure is most desirable. These factors, especially those as to source and quality of fat and serum solids needs further investigation. The results, however, do indicate a direct relation between acidity, viscosity and homogenizing pressure and I believe justify the conclusion that best results are obtained with low acidity mix ranging from 0.16 to 0.20 per cent. The studies further suggest from the standpoint of uniformity of product and homogenizing pressure it would be desirable to have a uniform standard acidity for each day's mix. The question as to the advisability of standardizing acidity is worthy of consideration and one that might well be studied in further trials.

Above all, ice cream manufacturers should realize

the importance of the use of fresh, clean, low acid milk products in their basic mix. Fresh, clean and low acid milk products are the foundation and corner stones of good quality ice cream without which it is impossible to build quality product and permanent success in business.

Conclusions and Summary.

1. Per capita consumption since 1909 has increased from 1.1 gallon to 2.4 gallons, an increase of 120 per cent.
2. Investment per gallon of ice cream has increased from 46 cents per gallon to \$1.12 per gallon.
3. Ice cream is not only a delicacy and refreshment, but an excellent and economical food that deserves a bigger place in the diet of the home.

Relation of Composition to Quality.

1. Butterfat up to 12 per cent decidedly improves the flavor of ice cream. From 12 to 16 per cent the improvement is slight and above 16 per cent many consider it too rich.
2. Butterfat has practically no effect on body and texture unless as much as 16 per cent is present, which is not advisable from a practical commercial standpoint.
3. Solids-not-fat have practically no effect on flavor. Over 12 per cent S. N. F. tends to produce a condensed, cooked and lactose flavor.
4. Solids-not-fat up to 10 per cent materially improve the body and texture and standing up quality. Over 12 per cent S. N. F. tends to produce a heavy, soggy and sandy body and texture.
5. Results of these trials indicate that both from a quality and a business standpoint a composition of 12 per cent fat, 10 per cent serum solids, 14 per cent sugar and 0.3 per cent to 0.5 per cent gelatine produces a well balanced and proportioned ice cream.

Relation of Acidity to Flavor or Palatability.

1. Ice cream with an acidity between .15 to .20 per cent received highest score, while samples with an acidity of over .25 per cent proved much inferior from a standpoint of flavor.

Relation of Acidity to Viscosity and Homogenizing Pressure.

1. The viscosity of the mix at homogenizing increases.
2. The homogenizing pressure necessary to obtain the desired viscosity increases as acidity decreases.
3. Low acidity ranging from .16 to .22 per cent with relatively high homogenizing pressure gave best results.
4. The question of standardizing acidity in order to get a more uniform product is worthy of serious thought and study.
5. It is impossible to reduce high acid milk products and manufacture a first class quality ice cream.
6. To produce a good quality product it is absolutely necessary to start with fresh, clean, low acid milk products.

OUR "ICE CREAM BABY" GOES ABROAD.

"The Milk Messenger" is the title of the house organ of Storer, Rodgers & Hughes, Ltd., London, England. Issue No. 2 of Vol. 1 has been received in the editorial department of The Ice Cream Review. This company, which operates one of the largest dairy plants in Europe, has devoted much study to American methods in ice cream production. For its front cover the company used the famous "ice cream baby" illustration that was used on the front cover of The Ice Cream Review several months ago and later on ice cream pamphlets issued by The Olsen Publishing Co.

The O. & B. Triangular Packer is made of heavy galvanized iron, 22" high and 11" diameter. Fits into all standard shipping tubs, and cabinets.

Your Packing Problems Solved

OF course you realize that your *real problem* is getting bulk ice cream into the hands of the *home trade full volume* and still *perfectly hard*.

Filled fibre containers, all sizes and flavors, packed at the factory in practical O. & B. Triangular Packers, will solve your packing and home-selling problems *once for all*.

The fountain clerk will find selection of sizes and flavors easy. In fact, the fibre container makes it easy for the home buyer to purchase bulk ice cream, which, by the way, he *much prefers* to brick ice cream.

Cream factory-packed in this way stays hard even after reaching user's home; and since there's *no loss in volume*, dealers will co-operate.

In short, O. & B. Triangular containers and factory-filled fibre packages will solve *once for all* your packing problems.

Write *today* for details and prices.

Oakes & Burger Co., Inc.

Dept. D., CATTARAUGUS, N. Y., U. S. A.

The diagram below shows the arrangement of filled Sea'right containers in the O. & B. Packer. Retailers with but one-hole cabinets usually take this combination. There is no waste space in the Triangular Packer, which holds 18 quarts or 34 pints; also combination of quarts, pints, and half pints.

BOOST NOW FOR SUCCESS OF NATIONAL CONVENTION, NEW ORLEANS, NOVEMBER 17-20, 1924.

Package Ice Cream and Its Advantages to the Manufacturer, Retailer and Consumer

This is the Prize-Winning Essay in a Contest Recently Conducted
by the Gearhart Sales Cabinet Co., Clearfield, Pa.

OVER a noon-day pot of tea two business men were discussing. The topic, originally the efficiency of present day manufacturing, had resolved itself into a discussion of ice cream. The first of these men, Mr. Gray, was enthusiastically interested in this popular refreshment. The other, Mr. Smith, frankly admitted he did not like it.

"Mr. Smith, what causes you to dislike ice cream?" said the first.

Mr. Smith replied, "I must confess it is entirely my imagination. Whenever I eat ice cream a doubt enters my mind which I cannot suppress and which renders it unenjoyable. I begin to wonder how many times it has been handled before it gets to me. I cannot help wondering if it is clean."

"Ah, my friend," earnestly began Mr. Gray, "you have not come abreast of the times. Last year you may rightfully have said that, but package ice cream has opened a new era. Ice cream which is packed in cartons insures cleanliness. There is no danger of salt or moisture or dirt getting into it. This style of ice cream is deliciously light and creamy, unlike the other, packed hard by a dipper. My wife insists that I buy in cartons because it saves so much time in serving. Mr. Smith, I

* This essay was written by R. Wienandt, Prop., Mikado Tea Room, 1 Kings Highway West, Haddonfield, N. J., and considered by the judges to be the best received in the contest, which closed April 10, 1924.

feel quite satisfied that once you have tried this new sort of ice cream you may set your mind at ease and thoroughly enjoy it."

FURTHER down the street, contemporaneously with this incident, an ice cream dealer was musing upon the same subject. Seated behind his counter during an idle hour he was saying to himself.

"When I first bought ice cream in cartons I had one end in view. I wanted to please my customers, and I did. My circle of friends has been unbelievably widened. In addition to this I have saved myself time, labor and money. I do not have the work putting it in boxes, it is ready to be sold. In package ice cream there is no shrinkage. I do not lose money by the diminishing of twelve quarts into a possible nine or ten as I did when it came in bulk. I can now calculate accurately my daily or weekly profits. My customers are more than satisfied. I am saving myself time, labor and money. No, I shall never go back to the old way."

TO meet the popular demands of the public I began to make brick ice cream." Thus began a manufacturer to a friend, in his office in a nearby city. "I have gained my prime objective, to give the people what they want. I have satisfied the public. I have made friends for myself and the retailers, and in addition I am profiting financially. Brick ice cream costs no more, yet it is so enjoyable that our record of consumers has grown enormously. Since everybody is satisfied package ice cream will soon be used exclusively."

DISTRICT ASSOCIATION ORGANIZED.

At a recent gathering of ice cream manufacturers of Columbus, Franklin, Seymour, Shelbyville, Greensburg, Madison, North Vernon and Bloomington, Indiana, the Ice Cream Manufacturers' Association of the Fourth District was organized. Albert E. Schumaker of Columbus was elected president and Dayton Fertig of Franklin, vice-president. R. L. Hammond, secretary of the Indiana Manufacturers of Dairy Products gave an interesting talk, which was followed by Charles Reeves of the Ballard Ice Cream Co., Indianapolis.

The Association, which will be a unit of the Indiana Manufacturers of Dairy Products, will meet quarterly at different cities in the district.

HOOD PLANT RESUMES OPERATIONS.

All the top floor and roof of the H. P. Hood & Sons, Inc., ice cream plant at Cambridge, Mass., was destroyed by fire on the night of April 4, as reported in the May issue of The Ice Cream Review. Officials of the H. P. Hood & Sons advise The Ice Cream Review that their plant is again in operation, and production is virtually back to normal.

"We were able to take care of our trade from our other ice cream plants," said G. H. Hood, Jr., secretary of the company, "and thereby did not inconvenience any customers."

Damage to the plant was estimated at \$55,000. Considerable damage was done to the machinery.

ENGLISH LAWMAKERS LAUGH AT OUR ICE CREAM.

The average Englishman thinks the American's ice cream is just as funny as the average American thinks that the Englishman's tea is funny. Most Englishmen always get a smile or a laugh out of the mention of ice cream.

The following is taken from a dispatch to a New York newspaper from London:

"The house of Commons has seldom echoed more laughs in a few minutes than it did the other day when a member asked for permission to introduce a bill permitting the sale of ice cream after 9:30 at night. Since the war nocturnal purchasing of ice cream has been illegal, unless it was accompanied by a meal.

"The laughter broke out first when Harry Becker, the member for Richmond, introduced his plea. He waxed louder when he said the object was to encourage the development of ice cream and soda fountains in this country. At present, he said, ice cream could be sold after 9:30 only if it was part of a meal, and this was a vexatious infringement on the liberties of the people. More laughter and a few cheers.

"If ice cream could not be sold after 9:30, the speaker argued, it began to melt and bacteria developed. Up roarious laughter. What would the colonial and foreign visitors to the Empire Exhibition think if they could not order an ice cream after 9:30, or entertain their friends at home with mineral waters? Loud guffaws.

"Hearty old Tories shook with amusement, back bench Laborites grinned, and the faces of some of the lady members broke out with smiles as Mr. Becker sat down. Then some one added to the general mirth by suggesting a division to let the whole House decide whether the ice cream bill might be presented. It seemed too funny for words, so no one seconded the motion.

"It will be interesting to observe just what the colonial and foreign visitors this summer will think about the way England puts up legal hedges around ice cream and chocolate candies and cigarettes and other pleasurable commodities, soon after sunset each evening. It is illegal to buy any of them after 9:30 unless a meal is ordered. Similar restrictions are imposed on beer and stronger beverages after the bars close at 10 or 11.

"Punch made recently a significant comment on the rising tide of laws.

"Mr. Robert Hughes," it observed, "has described American laws as the laughing stock of Europe. The trouble is that just when we are getting ready to laugh at United States legislation, we think about some examples of our own."

The English lawmakers are severely taken to task in The Ice Cream and Soda Fountain Journal, a supplement to The Confectioners' Union. The supplement is the official organ of the Ice Cream Federation of Great Britain and Ireland. Under the head line "Scrap the Lot!" here is what it had to say about England's unthoughtful parliament:

"The whole of our legislation concerning the sale of food and drink is farcical, silly, and fussy to the last degree. Only a patient people would stand it.

"Thus London's most widely-read evening paper on the ice cream curfew debate in Parliament. We've heartily agree, except that we should prefer 'foolish' to 'patient' in the last sentence. It is not surprising to read that the House of Commons recently 'rocked with laughter' when Mr. Becker, introducing his Bill to legalise the sale of ice cream and mineral waters after 9:30 p. m., outlined the absurdities of the present law.

Now Your Dealers Can "Display" Your Ice Cream

Successful merchandizers realize the value of "displaying" their products—bringing them right out where the public can not help but see them.

The Gearhart Selective Sales Cabinet

brings your ice cream out from back of the counter and presents an inviting appeal to the store customers. Its power of suggestion really sells ice cream and the selective feature spells actual service in delivering the particular variety and size of package selected. Quarts, pints, and half pints in six varieties all delivered with equal ease and speed by a turn of the handle.

*Let us show you some real sales results
from these silent salesmen*

**GEARHART SALES
CABINET CO., INC.
CLEARFIELD PENNA.**

Two sizes
13½ and 24 gallons
Large size floor space requires 40 in.
Small size " " " 34 in.

The Gearhart Ice Cream Package Filler

fills 40 packages at one time, either Quarts, Pints or half-pints. Absolutely full measure. No waste. Each carton is spotted and then clamped fast; the top is then brought over and the openings being beveled slip securely over the cartons. The exact amount of ice cream is then poured in and leveled. The top is thrown back and the cartons topped and closed. Compact, only occupies 20 x 40 inches.

glomerate and confusing regulations. His remarks are reported in our Parliamentary news, and have received widespread attention throughout the country. What the fate of his Bill may be we can only conjecture. It is sure to be met with fanatical opposition by the friends of 'Early Closing,' whose intense earnestness in the worship of their fetish, hung around as it is with absurdities causes vast amusement to those people whom it does not annoy. But whether the Bill be passed or not, it will have done something to focus public and Parliamentary attention on the need for drastic reform of the present regulations. The simplest plan, we suggest, would be to 'scrap the lot' and—if we **must** have legislation of this grandmotherly and interfering type—to make a new start by endeavouring to impart at least a little common sense into the business."

BIRMINGHAM PLANT IS GROWING.

Down in the land of cotton and sunshine, in Birmingham "the Magic City of the South," is located the Glen Iris Dairies, one of the foremost and most up-to-date plants to be found in the dairy industry.

Will Franke and E. C. Robinson, popular and well-known business men of Birmingham, are head of the company. Otto Straub is plant superintendent, and John Claitor is in personal charge of the ice cream department. George Williams makes the butter, H. A. Farmer superintends the distribution of products to consumers and W. A. Bumgartner has supervision of the six retail stores operated by the company. Mr. Farmer has twenty-one retail routes under his direction, covering the city with early morning deliveries of milk, cream and butter. The stores retail ice cream, milk, butter and other products. Deliveries of ice cream are made to the homes also.

The business of Glen Iris Dairies, so we are told, is built around the one word—quality. That the quality is appreciated is evidenced by the rapid and substantial growth of the entire business. The cold storage facilities have recently been enlarged to take care of the steady increase. More floor space is needed, is being planned and will soon be under construction.

The output of forty dairies is required to supply the milk and cream handled. Only the highest grade of milk is produced. The milk is brought to the plant, pasteurized in glass-lined equipment and bottled by machinery for distribution to the public. The quality of ice cream and butter is second to none in Birmingham or any other city, according to officials.

WAYCROSS, GA., WANTS ICE CREAM PLANT.

It was intimated at the weekly meeting of the County Dairy Association that an ice cream plant will soon be erected at Waycross, Ga., backed by local capital. One of the speakers at the meeting, a representative of an out of town ice cream plant, discussed with the dairymen the advisability of establishing an ice cream factory here and also the organization of a central milk depot. All of the dairymen expressed their willingness to sell to a central milk depot and the matter is now under advisement.

CERELOSE

CERELOSE is a pure white refined corn sugar which has been found to be of advantage to ice cream manufacturers for use in conjunction with cane sugar in the proportion of 25 to 50% Cerelose instead of 100% cane sugar, for the following reasons:

- 1.—Cerelose emphasizes the richness of the butter fat with the result that Cerelose develops the natural flavor of ice cream.
- 2.—Cerelose produces a smoother cream.
- 3.—Cerelose is the new solid builder for ice cream because it improves the body and texture. It will not crystallize nor form sandy cream.
- 4.—Ice cream made with Cerelose is more digestible than when made entirely with cane sugar because Cerelose is a dextrose sugar being directly assimilated by the blood, therefore, more ice cream may be consumed, particularly by infants and invalids.
- 5.—Cerelose is approximately 25% cheaper in price than cane sugar.

Cerelose should be used in the same manner as cane sugar, the amount depending upon the type of cream desired. 25 to 50% is recommended.

Address

ARTHUR A. CHAPIN PASSES AWAY.

Arthur A. Chapin, 59 years old, former president of the National Association of Ice Cream Manufacturers, and one of the founder of the North Carolina Ice Cream Manufacturers' Association, died in Washington, D. C.,

ARTHUR A. CHAPIN.

on April 22. He was widely known in the ice cream industry in the South-Atlantic states. The firm of which he was the head, the Chapin-Sacks Corporation, has plants throughout the South.

Mr. Chapin was the active head and guiding spirit of his company for many years, the company being organized in Washington, D. C., in the early nineties, and through the careful manipulation and management of Mr. Chapin and his associates, became one of the principal factors in the ice cream industry in the South, having 26 plants scat-

tered through the Virginias, the Carolinas and the adjoining states. Mr. Chapin had surrounded himself with an organization of high-class executives.

His funeral was held in Washington on Wednesday,

April 23, 1924, and was simple in character. Many of the leading members of the industry assembled from many parts of the country.

Death came to Mr. Chapin when, in the opinion of his physician, he was improving from an attack of poisoning which he suffered about two weeks ago at Savannah, Ga., where he was on a business trip. So gradually, but steadily, had Mr. Chapin improved that it was thought he might recover. His heart, however, which had become involved in the complications of the illness, suddenly gave out and he collapsed. His wife, Mrs. Frances Chapin, was with him at the end.

Mr. Chapin was one of the leaders in the ice cream industry. The company of which he was president was founded by him and others in 1902 as the Chapin-Sacks Manufacturing Company and was later merged into the Chapin-Sacks Corporation.

Mr. Chapin was born in Herndon, Va., and moved to Washington when a young man to engage in business. He was a life member of the City Club and belonged to the Congressional Country Club, New Jerusalem Lodge, No. 9, of Masons; Orient Commandery, Almas Temple, the Board of Trade and Washington Chamber of Commerce.

Surviving are the widow, Mrs. Frances Chapin; a son, Raymond E. Chapin; one daughter, Frances Chapin; one brother, Charles J. Chapin, and one sister, Miss Minnie Chapin, all of Washington.

**"THE FELLER PASSIN' BY."**

By C. A. Gratzner, Turnbull Cone & Machine Co.
"Peerless Cake Cones."

When the old home fire is burnin'
And the lights are way down low,
An' the old dreams come acrowdin'
From the days of long ago,
There comes a sort o' longin'
In the heart of every guy,
To make the budren lighter
On the feller passin' by.

It ain't so much the money
An' it ain't so much the style,
But jes' the way o' doin'
Makes the other fellow smile—
And then we sort o' chuckle
An' get to wonderin' why,
We felt so gosh darn happy
Helpin' fellers passin' by.

It ain't so much religion
That keeps the old world turnin' round,
But jes' the liftin' up o' folks
Who fall upon the ground,
An' sometimes in the darkness
To hear a humble cry
An' give the hand o' friendship
To the feller passin' by.

So beside the old home fire
When the lights are way down low,
And the old dreams come a crowdin'
From the days o' long ago,
There comes a sort o' fancy
That some day you and I
May be the feller passin'
The feller passin' by.

The Ice Cream Industry of the Middle West

*Michigan Ohio Indiana West Virginia
and Kentucky*

IN COVERING the development of the ice cream industry in this country, an undertaking begun in the April issue of *The Ice Cream Review*, there are certain sections of the country that cannot be embraced in one discussion. The Middle West is one of these sections. For this reason we are taking up the eastern half of the Middle West in this issue. Two states that do not literally belong to the Middle Western group are incorporated in this discussion—Kentucky and West Virginia. The former is a Southern state by all traditions and political circumstances, but in the development of dairy manufacturing, Kentucky is following virtually the same practices in vogue in the Middle West. The same applies to a great extent to West Virginia, which has a similar type of industry and agriculture. Although climatically these two are Southern states, they belong in the Middle Western group for the purpose of this discussion.

Other states in the Middle Western group, including Illinois, Wisconsin, Minnesota, Missouri, Kansas, etc., will be covered in subsequent issues.

IT IS impossible to study the development of the ice cream industry in the Middle West without being reminded that the manufacture of ice cream has truly become a national industry. From the narrow confines of the Eastern Seaboard, where the industry was earliest in development, it has swept over into the Middle West, where plants fully comparable with the best in New England and the Middle Atlantic states have been erected and are being operated along the most advanced lines.

Just as organization was responsible for the early development and later progress of the ice cream industry in the East, just so it has contributed its share to the upbuilding of the industry in Ohio, Michigan, Indiana, West Virginia and Kentucky. Lists of the officers and members of the associations of these two states reads like a roster of the most progressive manufacturers of the Middle West. The men who have done the most toward establishing quality on a sound plane are those who are doing the most for future expansion through co-operative effort.

PEOPLE who have been watching the growth of the industry in these states all are more or less familiar with such men as R. F. Frary, L. S. Wilson, W. H. Bechtel, C. J. Yunker and C. J. W. Smith of Michigan; George W. Strong, J. T. Swager, C. J. Jamison and J. H. Randolph of West Virginia; John Schubach, W. A. Wentworth, W. E. Telling and Everitt Antrim of Ohio; C. W. Field; John A. Risch and R. L. Hammond of Indiana, and Harry Cuscaden, Neil Mortensen, John Kloecker, Will Heuser and Carlton Ball of Kentucky. These are only a few entitled to places on the honor roll of co-operation.

WE FEEL sure our readers will enjoy reading what has been done in these states for exploiting ice cream and developing the ice cream industry. The work has been laid carefully and with solid foundation in Michigan, Ohio, Indiana, West Virginia and Kentucky. These states, it is felt sure, have some very eventful years before them. Quality is their cornerstone, co-operation is their Golden Rule, and a bigger industry is their goal.

Forty Years of Association Progress Celebrated in Michigan

E. A. Stowe Was the Paul Revere Who Aroused Dairy Manufacturers to the Challenge of Action

By R. F. FRARY*

WHEN Paul Revere on that April night 150 years ago, at the sign of the lantern hung in the old North Church tower, swam his horse across the Charles River and sped through the darkness some 30 miles to Lexington, arousing the sleeping colonists along the route with the alarm that the storm of British tyranny had broken and a secret army had been mustered and was marching to Concord, to take large warehouses of colonists' stores, he mustered the nucleus of an army that not only turned back the "red coats" at Concord, but one that through the seven long years of weird and weary struggle, gave birth to a new and independent nation.

R. F. FRARY.

As Longfellow immortalized Paul Revere in his famous poem, so too would Michigan's annual one hundred million dollar dairy industry, could it be permitted to speak its reverence, immortalize the name of Edward

A. Stowe. Mr. Stowe, a young, far-seeing editor of a trade magazine known I believe as the American Cheese Manufacturer, 40 years ago foresaw the benefits to our peninsular state of a well developed dairy industry, and realizing the necessity of some medium through which their then scattered efforts might be focused, a call was issued to all who were interested to assemble in Grand Rapids on Feb. 25 and 26, 1885, to lay the foundation for intelligent and systematic dairy promotion.

An organization was perfected in which E. N. Bates of Moline was elected president, and E. A. Stowe of

Grand Rapids was elected secretary. Mr. Stowe, now publisher of the Michigan Tradesman, and E. A. Haven of Bloomingdale are the only two charter members of the association now alive.

Last February the Michigan dairy industry celebrated its fortieth successive annual convention with a rousing three-day meeting, with a registered attendance of about 700 and with over 50 exhibitors of dairy and ice cream equipment and supplies.

OWING to the distinctively diversified branches of the dairy business and to better promote the respective branches, and yet unite the industry in a common cause, several meetings were held during the fall and winter of 1919 for the purpose and with the result of a reorganization in which membership in the parent order, instead of being by individuals was through the respective unit or branch organization.

The eight branches participating in and constituting the present Michigan Allied Dairy Association are:

The Michigan Ice Cream Manufacturers' Association.

The Michigan Association of Creamery Owners and Managers.

The Michigan Cheese Industry.

The Michigan Dry and Condensed Milk Industry.

The Michigan Market Milk Dealers.

The Michigan Milk Producers' Association.

The Michigan State Farm Bureau.

The Michigan Dairy Boosters (machinery and supply dealers.)

In the main the activities of the above named branches are carried on under the auspices of the several unit organizations, leaving the Allied Association to function more definitely in the capacity of the annual show, in legislative and transportation matters, and as a clearing house on joint matters of production and manufacture.

We believe the idea of including the producers' organization in a general state association is exceptional in practice but exceedingly beneficial in effect, as one of the fundamental principles of organization is unity, and unity between producer and manufacturer can best be fostered through a common knowledge and with a common purpose.

United Chemical & Organic Products Co.

Home Office: 4200 South Marshfield Ave., Chicago

Branches: NEW YORK BALTIMORE DETROIT NEW ORLEANS SAN FRANCISCO MILWAUKEE

IF YOU KEEP UP WITH OUR ADVERTISERS, YOU KEEP UP WITH PROGRESS.

THE Michigan Ice Cream Manufacturers' Association, headed by LeRoy Wilson of Port Huron as president and W. H. Bechtel of Caro as secretary, while they have been facing some discouraging features, have done much to improve conditions and pave the way for a more prosperous and more firmly established industry. They have this season put on a full time field secretary and the results of his work are showing satisfactorily.

Gallonage figures for 1923 are not yet completed, but for 1922 were 9,285,265. This was a gain over the year preceding of 802,322 gallons or nearly 10 per cent.

In 1910, Michigan had 478 registered ice cream manufacturing plants but no record of her gallonage at that time seems to be available. That number has gradually decreased, however, until in 1923 we show a total of only 289 registered plants. In spite of these facts there has been a steady increase in output. This seems to be typical of the present day tendency to centralize business.

The following table indicates the percentage of plants classified according to the amount of ice cream made.

	Per cent
Per cent of plants making less than 1,000 gals. per year	10.9
Per cent of plants making 1,000 to 10,000 gals. per year	46.7
Per cent of plants making 10,000 to 50,000 gals. per year	27.5
Per cent of plants making 50,000 to 100,000 gals. per year	7.0
Per cent of plants making over 100,000 gals. per year	7.9

Of the 289 plants now licensed to operate in Michigan, a large number are dormant or nearly so during six to eight months of the year. The following table

shows the relative amount of ice cream made in the various sized plants.

	Per cent
Per cent of ice cream made in plants making less than 1,000 gals. per year	.10
Per cent of ice cream made in plants making 1,000 to 10,000 gals. per year	4.1
Per cent of ice cream made in plants making 10,000 to 50,000 gals. per year	13.82
Per cent of ice cream made in plants making 50,000 to 100,000 gals. per year	12.42
Per cent of ice cream made in plants making over 100,000 gals. per year	69.22

The annual report of the Bureau of Dairying under the State Department of Agriculture issued for the fiscal year ending June 30, 1923, from which the above figures were taken, shows that from a total of 91 samples of ice cream officially taken, only 4 showed illegal butterfat content, the standard in this state being 10 per cent. Our ice cream law also limits the amount of gelatine in ice cream to seven-tenths of one per cent, and only milk, cream, eggs, sugar, and natural flavoring are permitted in plain ice cream in addition to gelatine and vegetable gums.

THROUGH the concerted effort of the association there has been a gradual tendency toward improved sanitary conditions and at the recent session of legislature the general ice cream law was so amended that the commissioner of agriculture can promulgate rules and regulations governing the sanitary conditions in places of manufacture.

This in general is welcomed by reputable manufacturers and in fact rules are just now being instigated that will allow the manufacture of cream only in places that are properly lighted and ventilated, and that comply with the reasonable standards of decency.

The finest of co-operation applies within the state between the trade and the law enforcement department which is the Bureau of Dairying, and Michigan manufacturers believe that the ice cream industry is in the healthiest condition from point of favor with public and prospect for increased gallonage that it has ever been.

National cone week, national slogans, and co-operative advertising all are holding high to view of the the public the fact that ice cream is not only a food, wholesome and delicious, beyond that of any other confection, but it establishes the business of the ice cream industry in the mind of the public and sells to the thinking man the idea that the industry is backed by genuine business people who are in the game because it is substantial and sound.

Twenty-Eight Years in Michigan Dairy Industry

C. J. W. Smith has been Prominently Identified with Organization Progress in Michigan. A Review of Association Activities

TWENTY-EIGHT years with the Michigan association is the record of C. J. W. Smith, present secretary and treasurer of the Michigan Dairy Boosters. The first meeting he attended of the Michigan Dairy Association, later reorganized as Michigan Allied Dairy Association, was held at Ypsilanti, Mich., in 1896. At that time exhibit was held in a vacant store and the principal exhibitors were the Creamery Package Mfg.

**C. J. W. SMITH, Secretary
Michigan Dairy Boosters.**

Co., The Diamond Crystal Salt Co., and the De Laval Separator Co. These three concerns each contributed \$25.00 and some small prizes. Other expenses were met by the dues assessed each member, namely \$1.00 a year.

As Mr. Smith recalls it, one outstanding feature of this meeting was a "round table" visit of a few dairy salesmen with the governor of Michigan, Hazen S. Pingree, on the evening before the opening session. The governor was present to give an address of welcome.

Of the original organizers of the Michigan Dairy Association—some forty years ago—Mr. Smith believes E. A. Stone, publisher of Michigan Tradesman, Grand Rapids, and E. A. Haven of Bloomingdale, are the sole survivors. It is believed that Simon Hagedorn of Fenton, is the only remaining exhibitor of butter at the first meeting held at Grand Rapids.

The supplymen's association was organized at the Armory, Detroit, during the meeting of Michigan Dairy Association May 8, 1917. The name of the organization was "Exhibitors' Federation of Michigan Dairy-men's Association." The officials were D. W. Shiel, president; J. B. Hill, vice-president, and C. D. Knapp,

secretary-treasurer. The by-laws committee consisted of J. F. Ruff, A. J. Ratz, and W. M. Quirk. The objects of the organization were outlined in the by-laws as follows:

1. To promote the welfare of the dairymen of Michigan.
2. Good fellowship among its members.
3. To co-operate with the Michigan Dairy Association.

The membership then consisted of sales managers and salesmen of firms and corporations doing business in connection with the dairy industry of Michigan. The twenty-nine members were assessed \$2.00 a year for membership.

AT the second annual meeting held with the Michigan Dairy Association, February 6, 1918, at the auditorium in Saginaw, the incumbent officials were re-elected and the directors were W. E. Graves and C. J. W. Smith. The membership at this meeting numbered twenty-seven.

The third annual meeting was held in conjunction with the Michigan Allied Dairy Association gathering at Lansing, December 5, 1918. The membership of the Dairy Boosters had increased three in number over the preceding year, and the officers were elected as follows: J. B. Hill, president; R. J. Ellwanger, vice-president, and C. J. W. Smith, secretary-treasurer. The directors were D. W. Shiel and O. E. Julian.

On January 29, 1920, the fourth annual meetnig was held at Grand Rapids' Chamber of Commerce. At this meeting action was taken and the Michigan Dairy Association was reorganized as the Michigan Allied Dairy Association.

**C. J. YUNCKER, President
Michigan Dairy Boosters.**

The Exhibitors' Federation of Michigan Dairymen's Association was also reorganized at this time under the name of Michigan Dairy Boosters and became a full unit in membership of the Michigan Allied Dairy Association. Complete organization consisted of the following units: Michigan Association of Creamery Manufacturers and Owners, Michigan Association of Ice Cream Manufacturers, Michigan Milk Producers, Michigan Market Milk Distributors, Michigan Cheese Manufacturers, Michigan Condensed and Dry Milk Manufacturers, Michigan Farm Bureau, and Michigan Dairy Boosters.

The officers of the Michigan Dairy Boosters were elected as follows: R. J. Ellwanger, president; C. J. Yuncker, vice-president and C. J. W. Smith, secretary-treasurer. No exhibition was held during this meeting.

**LET SOLAR SERVICE
HELP YOU CARRY
THE PEAK LOAD!**

SOLAR
ICE CREAM CANS

Warm June days, a "4th" that sizzles, and blazing hot summer days following. Three months of big ice cream demand. Check over your stocks of ice cream cans now. Are you prepared to handle the increased production? Turn to Solar Service to take care of your needs.

We build both types of Ice Cream Cans—soldered and welded. Hundreds of thousands of Solar Soldered "Ultra" cans are in use—because they are unequalled for service. And their quality is matched by the Solar Welded "Tin-Okeh"—a heavier, stronger can, with practically an indestructible bottom.

Each is the best you can obtain of its type. And pound for pound they COST YOU LESS.

Order today before the rush strikes you!

EVERY MANUFACTURER IN THE COUNTRY SHOULD BE A MEMBER OF THE NATIONAL ASSN. OF ICE CREAM MFRS.

Hotel Pantlind, Grand Rapids, was the meeting place of the Fifth annual meeting of the Michigan Dairy Boosters on February 17, 1921. The officers and directors were all re-elected, and the total membership was thirty-seven members. No exhibits were made at this meeting.

EXHIBITS were made at the sixth annual meeting held at the auditorium, Saginaw, February 15, 1922. At this gathering C. J. Yuncker was elected president, H. D. Black, vice-president and C. J. W. Smith, secretary-treasurer. The membership at this time had increased to sixty-three.

Elaborate exhibits were given by members of the Michigan Dairy Boosters at the meeting held in conjunction with the Michigan Allied Dairy Association at the armory in Kalamazoo, on February 21, 1923. C. J. Yuncker and C. J. W. Smith remained in their official positions as president and secretary respectively, but D. W. Shiel replaced H. D. Black as vice-president. The directors were Elmer Mack, H. W. Black, Claude A. Grove, A. G. Traeder, and Lloyd L. Hughes. The membership at that time was reported as eighty-one.

On February 4, 1924, the eighth annual meeting was held at the Hotel Columbia, Kalamazoo, and the biggest exhibition in the history of the Michigan Dairy Boosters was held at the Armory building. The incumbent officers were re-elected and the directors are as follows: Elmer Mack, Lloyd H. Hughes, R. Warner, Jr., Claude A. Grove and S. A. Von Jasmund. The secretary reports their present membership as incomplete at this time but up to date it numbers sixty-eight members.

NO action has been taken regarding plans for next meeting. Neither has it been decided whether or

not exhibits will be given in connection with the next gathering.

For the benefit of the non-members, C. J. W. Smith, 561 Continental Ave., Detroit, gives the following facts:

The dues which are \$10.00 a year for each firm or corporation are used

1st. To pay the pro rata unit assessment to the Michigan Allied Dairy Association.

2nd. To defray legitimate expenses.

3rd. To provide entertainment as decided at the annual meetings.

4th. For any other expenses as the board of directors decides to be for the welfare of the dairy association.

The Michigan Dairy Boosters enjoy representation on the board of directors of the Michigan Allied Dairy Association, and membership in the Boosters carries also membership in the Allied Association and its units. The object being to give each interest in the dairy industry of Michigan full representation in the Michigan Allied Dairy Association.

MICHIGAN COMPANY ENTERTAINS DEALERS.

The White Ice Cream Co., Flint, Mich., recently celebrated its first anniversary by entertaining its dealers and representatives in the Hotel Durant. A six-course dinner was served, and a five-piece orchestra furnished the music throughout the evening.

The toastmaster, F. H. Rankin, called for short speeches, and in a brief talk he congratulated the company on its splendid progress during the first year. J. E. Andrews, a director of the company, said, "To build up a business such as the White Ice Cream Co. now has in one year seems like a remarkable success and nothing in the world is as good for success as good fellowship and a general feeling of co-operation."

The White Ice Cream Co. has about fifty dealers and, according to officials, is continually improving its plant to take care of the steady increase in business.

The directors are Charles H. Bonbright, A. C. White, George W. Cook, J. E. Andrews and E. McLogan.

OHIO FIRM GROWS.

Dave W. Heckler, Napoleon, O., opened a small ice cream plant 18 years ago, and was successful. Five years ago he purchased a bottling plant to manufacture soft drinks and added it to his ice cream business, and last year he purchased a piece of ground on the main street just half a block from the court house and built a very fine building of brick and concrete blocks for his business. He has an up-to-date plant and is producing 30,000 gallons of ice cream a year.

NEW EQUIPMENT FOR INDIANA PLANT.

The Quality Ice Cream Company is installing all new equipment and machinery in its Bloomington, Indiana, plant. A ten-ton enclosed compressor, two freezers and 1 six-ton vertical shell and coil type brine cooler with 5-inch cork insulation and wood jacket are being added. All machinery is to be direct motor-driven. Clyde E. Shoddy tells us. The ante room for storing ice and mix is 10 by 12 by 9 feet. The shelves hold 1,500 gallons of bulk and 300 gallons of brick ice cream. At the present time the Quality Ice Cream Company is buying their mix, but according to Mr. Snoddy, they intend to later on add the milk business and their present location will permit this expansion.

Organization Has Played Important Part in Development of Indiana's Dairy Manufacturing Industry

By R. L. HAMMOND*

THE idea of an association of ice cream manufacturers in Indiana was first conceived in 1907. During that year a small group of manufacturers who foresaw the benefits which might be obtained through the proper sort of an organization sought to interest other manufacturers. Much of the first year was spent in laying out plans and it was not until 1908 that the actual organization, later known as the Indiana Association of Ice Cream Manufacturers, was perfected. The active leaders in the early days of the organization were Sig Frank, Kokomo; H. L. Conter, Decatur; John Chamberlin, LaFayette; Julius Kreusch, Anderson; W. F. Shearer, Logansport; Fred Yoars, Marion; Charles Field, Indianapolis and F. S. Plasterer, Huntington. Mr. Frank served as the association's first president and Mr. Conter served as the first secretary.

Almost immediately after being organized the association set out to seek a reduction in express rates on ice cream. In 1910 the association, through its efforts, was successful in securing a twenty-five per cent reduction in express rates and thus accomplished the primary purpose for which it was organized. Being successful in its first undertaking the association proved to the ice cream manufacturers of the state that much could be accomplished through organization and from that time on it has been an important factor in the ice cream industry of Indiana.

The association has constantly sought to improve conditions within the industry by encouraging the use

* General Secretary Indiana Manufacturers of Dairy Products.

and sale of ice cream, by creating a friendly spirit among competitors, by discouraging the use of unfair practices and by encouraging the manufacture of ice cream of high quality.

In legislative matters pertaining to the ice cream industry the association has always taken an active interest. The sanitation law, referring to ice cream plants, the clean can law and other laws for the betterment of the industry have been fostered and supported by the association.

In 1920 the association again, through its efforts, prevented an increase of fifteen per cent in the estimated weights of intra-state shipments of ice cream.

The object of the association has always been to promote the interest of its members and to safeguard the industry as a whole. The association works in close harmony with the Pure Food and Drug Department of the state and Purdue University.

The Indiana Association of Ice Cream Manufacturers continued as an individual association until 1918, at which time it affiliated with and became a division of the Indiana Manufacturers of Dairy Products Association. The present officers of the ice cream division are W. R. Coffroth, Chamberlin Ice Cream Company at Lafayette, Ind., and A. W. Antrim, Jessup and Antrim Ice Cream Company, Indianapolis, Ind. Mr. Coffroth is chairman and Mr. Antrim is secretary of this division. The ice cream division now has fifty active members.

INDIANA PLANT IN NEW QUARTERS.

The Royal Ice Cream Co., 114 North Fifth St., Terre Haute, Indiana, moved into its new building early in May. Officials will continue to add new equipment as the increase in business demands. At the present time two 40-quart freezers are being used, one 15-gallon filling machine, and the refrigeration is furnished by the People's Ice Company, who occupy the building jointly with the Royal Ice Cream Co. Two large delivery trucks and one Dodge light weight truck will distribute the company's product.

The People's Ice Company is an all electric ice manufacturing plant, and according to reports, it is the most up-to-date ice plant in the state of Indiana. The Royal Ice Cream Company has entered into contract with this company whereby they freeze and hold cream, furnishing the necessary refrigeration on a gallonage basis. The rent for the first year is \$2.00 per hundred gallons of cream manufactured, and after the first year, this will be increased to \$3.00 per hundred gallons. This, of course, is advantageous inasmuch as the overhead of the ice cream company will not be gauged according to the amount of business done.

The ice cream company occupies 193 feet by 22 feet, basement, main floor and second floor, and garage for six trucks and a room on the side of the building 60 by 20 for storing salt and tubs.

I. H. King, manager, advises that his company makes a very high quality of ice cream; that they were compelled to turn down much business because of the lack of facilities for manufacture. However, they will endeavor to make an even higher quality product and their new plant will enable them to meet the steady increase in business, he says.

OHIO FIRM SHOWS THE PUBLIC HOW.

The Gem City Ice Cream Co., Dayton, O., believes in taking the public inside of its doors to show them how ice cream is made. It is one of the most up-to-date plants in this state.

The business was begun twenty-two years ago in a little frame building on the present site by Louis E. Ellis. He made the ice cream, sold and delivered it, using a one-horse outfit to give service, and from this modest beginning has grown to a building on ground space of 125 feet front and 90 feet to the rear, with the title to adjacent property, which in time will be used for further expansion.

Inside of the plant most every detail of ice cream manufacturing is complete. From the making of brine, ice, cold storage and repairing of automobiles, every detail of management is complete. The power house is located across the alley from the main plant. The laboratory, according to report, has no equal in the city of Dayton. Seventeen trucks are required to handle the company's trade. These trucks cover zones of business in all directions from Dayton, extending as far south as Hamilton and as far north at Piqua.

ICE CREAM PLANT ADDED.

Guernsey Milk and Ice Cream Company, Lebanon, Ind., has added an ice cream plant to its dairy, having bought equipment. The building is of dark red brick, size 30x120, one story. Two trucks and two wagons will be operated. J. A. Fowler, Chas. A. Thompson and Emmett Thompson are owners. Mr. Fowler formerly was with the Fleming Ice Cream Co., Jackson, Mich.

Heckler Co., Napoleon, O.

Dan. Heckler, Napoleon, O., has purchased back his ice cream and bottling plant.

Bryan Ice Cream Co., Bryan, Ohio, has added five new auto trucks. Other improvements are being made and the company is for bigger business. Two new refrigerated, 8-hole ice cream cabinets have been bought.

ICE CREAM PLANT ADDED TO DAIRY.

Guernsey Milk and Ice Cream Co., Lebanon, Ind., has added an ice cream plant to its dairy, having bought an emulsifier, freezer, pasteurizer, ice crusher and other equipment. The building is dark red brick, size 30x12 feet, one story. Two trucks and two wagons will be operated. J. A. Fowler, Chas. H. Thompson, Emmett Thompson are owners. Mr. Fowler was formerly with Flenina Ice Cream Co. at Jackson, Mich.

Interior & exterior views of new Virginia Av. plant
of The Terminal Cold Storage Co., Wash., D. C.

Door Satisfaction is assured in this New Plant

THE building pictured above represents the very last word in modern cold storage plant efficiency. It embodies every new feature for the reduction of wasted refrigeration and, standing as vanguard against this enemy of the cold storage plant are a total of 103 Jamison Cold Storage Doors and Windows, including 34 Jamison Doors, 20 Jamison Double Fireproof Doors, 10 Jamison Single Fireproof Doors, 15 Jamison Bunker Doors, and 24 Jamison Windows.

The building was built to withstand Time—and as it was desired that the Doors be worthy of

the structure, specifications were for Jamison's. Science may be striving to make most equipment lighter—but such is not the case with Refrigerator Doors. Weight means strength, durability, dependability! The hard use to which they are put requires such character! That's why, if put to the test, you would find that Jamison Products are **heavy duty products**—that the doors themselves weigh more than other doors—that the hardware used, aside from being the most practical and efficient, weighs three times as much as the hardware on other doors.

If you care to make comparative efficiency tests, we shall be glad to have you do so — at our expense.

Jamison Doors
for better refrigeration

JAMISON COLD STORAGE DOOR CO., Hagerstown, Md., U. S. A.

The Ice Cream Manufacturers' Association of West Virginia

In 13 Years the Association Has Done Much to Advance
Quality Production and Business Ethics

By C. J. JAMISON, Secretary of the Association

THE idea of organizing an ice cream manufacturers' association in West Virginia, had its inception in the mind of W. M. B. Sine, at the time and for several years afterward, general manager of The Imperial Ice Cream Co. of Parkersburg, West Va.

Pursuant to a letter addressed by Mr. Sine, in November of 1911, to the few ice cream manufacturers operating in West Virginia at that time, inviting them to meet at the Kanawha Hotel at Charleston, West Va., for the purpose of discussing the possibility of organizing an association in the state for the general good of the ice cream industry.

At this meeting the following manufacturers were present:

John Kloss, Kloss Ice Cream Co., Wheeling; K. Aurady, Kanawha Velvet Ice Cream Co., Charleston; C. D. Gentry, Gentry Bros. Ice Cream Co., Scarbo; Joe L. Wilson, Wilson Creamery Co., Huntington; J. J. Wallace, Wallace Ice Cream Co., Elkins; C. F. Jamison, Montgomery Ice Cream & Bottling Works, Montgomery, and W. M. B. Sine, Imperial Ice Cream Co., Parkersburg.

The meeting was called to order and after some preliminary discussion an association was organized and named The Ice Cream Manufacturers' Association of West Virginia.

AT THIS meeting, the seven manufacturers attending were named the directors for one year and these directors in turn elected the following officers:

C. F. Jamison, Montgomery, president; J. J. Wallace, Elkins, vice-president; Joe L. Wilson, Huntington, Treasurer, and W. M. B. Sine, Parkersburg, secretary.

A committee was appointed to draft a constitution and by-laws for the government of the association, which committee made a report and the original constitution and by-laws were adopted at this meeting.

Several subjects of interest in the manufacturing of ice cream were discussed, the correction of abuses employed by the express companies in transporting ice cream, the insanitary condition of empty containers returned by customers were given criticism and ways were suggested looking toward putting the industry on a new plane. The convention adjourned after a four hours' session to meet at Parkersburg, W. Va., at a date to be selected by the board of directors, and thus The Ice Cream Manufacturers' Association of West Virginia was born at Charleston, W. Va., on December 6, 1911, with a total membership of seven.

FROM the original seven members forming the association at Charleston, in 1911, the Ice Cream Manufacturers' Association of West Virginia has increased in numbers and today the membership is between 25 and 30, which comprises 90 per cent of the manufacturers operating in the state and have an associate membership of 50 to 60, composed of ice cream supplymen and their representatives. Annual conventions have been held alternately at Charleston, Parkersburg, Wheeling, Clarksburg, and Huntington since the organization of the association. The convention this year (1924) will be held at Clarksburg, in November.

Several of the largest manufacturers in the state have been boosters for the association and have helped to make the organization a great success, prominent among them being, John Kloss, of Wheeling; Joe L. Wilson, Huntington; S. B. Haffner, Elkins; J. J. Schmidt, Charleston; J. J. Wallace, Elkins; J. Truman Swager, Clarksburg; W. M. B. Sine, Clarksburg; J. H. Randolph, Parkersburg.

Sterilizing Will Cost Much Less, This Way!

Every creamery operator or cheese maker wants to know how to run the factory at lowest cost. Here is a suggestion that may help you cut the cost of sterilizing in the coming summer months when the problem of keeping things purified is important.

Instead of **rinsing** large pieces of equipment such as vats, pasteurizers, holding tanks, etc., with B-K dilution, use a compression sprayer for this work. A compression sprayer containing B-K dilution covers large surfaces with little fluid—quickly and cheaply. This method requires less sterilizing dilution and does excellent work.

The above illustration shows how and where a compression sprayer can be used. Most any hardware store supplying a farm trade sells compression sprayers. The B-K dilution for spraying should be the same one you would use if you were rinsing by the old method. But in using a sprayer far less dilution is required, and thus you save money on the operation.

Easy to Purify Difficult Places

Such places as underneath the lids of pasteurizers, lids of starter cans and tanks, are hard to reach by the rinse method. But by spraying with B-K dilution it is very simple to cover these difficult places as easily as any other place.

Use Our Service Department

The first hot days of summer will soon be here. If bacteria trouble shows up in the slightest way, **write us immediately**. If you don't root up bacteria trouble when it first appears, you may get off odors and flavors, rotten smells, mold, etc., **all summer long** from the same source. We have a staff of bacteriologists who will gladly advise you on your problems. In fact, they will gladly co-operate **now** to see if you are properly prepared to meet the demands of hot weather on your sanitary methods. Just write and tell us what part of your equipment for which you would like to have sanitation directions.

CLIP AND MAIL COUPON

General Laboratories, Dept. 29B.
Madison, Wisconsin.

Please send me full information and directions on how to keep purified the following pieces of equipment:

Name

Address

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Until he severed his connection with the ice cream industry in West Virginia, Mr. Sine was a prominent leader in association and convention work and was for several years president of the association. He built and maintained several large plants in the state, and was a big factor in developing the ice cream business, and in increasing the per capita consumption of ice cream in West Virginia.

The association stands for a good, pure food product, made correctly under sanitary conditions and has increased friendship among the manufacturers in the state. It has created interest in the ethical way of soliciting business and treating the competitor fairly and squarely.

The present directors and officers of the association are: Directors, J. H. Randolph, Parkersburg; C. F. Jamison, Huntington; S. B. Haffner, Elkins; J. J. Schmidt, Charleston; G. W. Shetler, Wheeling; P. D. Woods, Bluefield; W. H. Bonner, Morgantown; J. T. Swager, Clarksburg, and E. E. Livesay, Lewisburg.

Officers: President, J. H. Randolph, Parkersburg; vice-president, G. W. Shetler, Wheeling; sec-treas., C. F. Jamison, Huntington.

ONE OF OHIO'S HANDSOME NEW PLANTS.

The new plant of the R. L. Graham Company at Lima, O., is one of the finest exclusive ice cream plants in the state. R. L. Graham says he started in the manufacture of ice cream in a very small way. On October 1, 1904, he was in the milk business on Union street and a friend called over the phone, and, in a kidding way, asked Mr. Graham to make him a gallon of ice cream. Mr. Graham had a one-gallon hand freezer at his home and he filled the order.

The friend thought it was so good he told others about it, and the following week another party phoned Mr. Graham an order for one gallon of ice cream for Sunday. From then on Mr. Graham took orders for ice cream. Later he bought a 10-gallon freezer and worked day and night to fill his orders for 15 years, after which time he bought more freezers and tubs and opened up a larger plant on East Market street, where he outgrew his plant and now runs an exclusive ice cream plant in a new two-story, concrete building, 60x100 feet, with modern machinery. Twelve trucks are operated.

Growth of Indiana Ice Cream Industry

Review of Past Ten Years Shows Healthy and Rapid Growth

By PROF. W. G. GOSS*

THE Indiana ice cream industry has enjoyed a healthy and rapid growth during the past ten years, according to records compiled by the creamery license division, dairy department, Purdue University, Lafayette, Ind. Indiana licensed factories have more than doubled the output of ice cream since 1914. The following tables give a brief summary of the development of the Indiana ice cream industry from 1914-1923, inclusive.

Table 1 gives the number of ice cream factories licensed for the years stated:

Table 1.

1914	39	1919	26
1915	29	1920	30
1916	27	1921	26
1917	27	1922	33
1918	19	1923	28

The number of factories are those that reported ice cream as the major product. In this connection it is interesting to note that many of the factories whose major products is butter, condensed milk, or market milk, produce more ice cream than many factories that report ice cream as the major product.

Ice cream manufactured by licensed plants constitutes about 60 per cent of the total estimated consumption in Indiana. For the years 1914 to 1923, the production of ice cream by all licensed plants, together with the per-

* Acting in charge, Department of Dairy Husbandry.

centage increase over the preceding year and the increase over 1914, is given in tabulation No. 2.

Table 2.

Year	Licensed plant ice cream production Gallons	Per Cent increase or decrease over preceding year	Per cent increase over 1914
1914	2,035,974		
1915	1,577,557	-23.03	23.03
1916	2,111,701	33.85	3.73
1917	2,124,636	.61	4.35
1918	2,595,233	22.14	27.47
1919	3,227,413	24.16	58.52
1920	4,132,318	28.00	103.02
1921	3,529,415	-17.08	73.85
1922	4,121,946	16.79	102.02
1923	4,447,125	7.88	118.4

Table No. 2 shows a yearly increase, with two exceptions in 1915 and 1921, over each preceding year. The output of ice cream has more than doubled in ten years. The production of ice cream in 1923 was 118.4 per cent greater than in 1914, and there has been an average yearly increase of 9.9 per cent each year.

THE ice cream market seems to be very sensitive to economic conditions, which will be noted in the output in 1915 and 1921. The war having an effect in 1915, and the heavy slump in credit conditions being a contributing cause in 1921.

During the same ten year period the consumption of ice cream is estimated as follows:

Table 3.

Year	Estimated consumption, gallons
1914	3,429,394
1915	2,657,334
1916	3,556,025
1917	3,578,916
1918	4,395,830
1919	6,311,379
1920	6,960,703
1921	5,945,163
1922	6,943,259
1923	7,489,232

Again you find a low consumption for the years 1915-1921.

Using the figures for consumption as given in the above table, together with the population of Indiana, the capita consumption for the last four years is as follows:

Attention Ice Cream Makers

Make your supply fresh condensed milk from "MADE OF THE MIST" Powdered Sweet Milk.

Analysis of "MADE OF THE MIST"

Moisture	4.36 %
Butterfat	5.90
Ash	7.78
Protein	32.46
Lactose (Milk Sugar)	49.63
Acidity, As Lactic Acid	2.08 %

Table 4.

Year	Per capita gallons
1920	2.37
1921	2.00
1922	2.31
1923	2.48

An increase of .17 gallons per capita is shown for 1923 over 1922 or 7.29 per cent.

The graphic illustration below shows clearly the trend of the ice cream industry in Indiana. What will happen in 1924 is a matter of conjecture. If the agricultural conditions improve and credits are good, an increase can be expected.

Should the situation remain unaltered, the industry cannot expect an increase in consumption of its product greater than the 1923 level plus the small increase in consumption due to increased population. Further, the season's conditions seem to have a direct influence upon the consumption of the ice cream manufactured. Should the warm season be late or continue comparatively cool, the industry can hardly expect an increase over the previous year; however, if the season turns out to be very warm, and becomes truly ice cream weather, there is very little doubt but what the output of this state will enjoy a good market and an increase in consumption can be expected.

With an increased output of 118.4 per cent and a yearly increase of 9.9 per cent for ten years, together with an increasing per capita consumption, the outlook is bright for a continuous growth in this important branch of the dairy industry in the future.

HENDLER CO. CELEBRATES OPENING.

As this issue of The Ice Cream Review goes to press, officials of the Hendler Dairy Company, Baltimore, Md., are making extensive preparations for the opening of their enlarged plant, which they call, "a sort of improvement upon perfection." The company recently announced the program of three evenings of "good time," with a delightful entertainment, refreshments, music and souvenirs for everybody.

The Mark of Merit.

Eliminate Repair Bills!

BY USING

A UNIVERSAL HOMOGENIZER

Built to Keep Upkeep Down!

The universal embodies all the advantages of old time machines in addition to many much needed improvements.

So constructed that it will stand up under severest of tests day in and day out—year in and year out—without adjustments or replacement of parts.

Individual cylinders machined from rolled Tobin bronze bars (not cast).

High pressure manifold machined from rolled Tobin bronze having tensile strength of 55,000 pounds.

Individual shimming of cross-head slides maintains correct individual alignment of pistons at all times.

Chrome vanadium steel shafts.

Monel metal pistons not affected by milk acids.

Homogenizing valve—internal spring type—plug and seat are made of an alloy of semi-precious metals so hard it cannot be machined but must be ground with carborundum.

Built in belt or motor drive sizes 200, 400 and 800 gallons.

NOAKER ICE CREAM FOOD SHOW EXPLOITATION AT CANTON, O.

Exploitation of its products through the medium of a booth at a pure food show was successfully promoted recently by the Noaker Ice Cream Company, Canton, O.

The object of the display, Lloyd Bletzer, advertising manager, said, was to show the people just what was possible from ice cream. The Noaker concern presented

in its booth a display showing a half hundred molds from which ice cream in the various forms is made for parties, lodges, organizations and most any occasion.

These forms were presented on a large table, in full view of the spectators who passed the booth afternoon

and evening. It was interesting to note the few persons who really knew just what process was employed in making ice cream forms.

In a refrigerator to the rear of the exhibit were shown a half hundred forms ice cream can be made up into, and this display also proved a most interesting feature of the food show.

The Noaker Ice Cream Company, besides putting out a different flavored brick each week, makes some 100 or more different ice cream novelties, many of which are always available from stock, and others, of course, being made up to special order.

It is estimated that fully 50,000 persons inspected the Noaker display the week the show was in progress.

Bletzer considers this stunt brought the firm more in the way of advertising than any of the past year and was the least expensive.

PACIFIC MANUFACTURERS PREPARE FOR RECORD CONVENTION.

Jay H. Kugler, secretary of the California and Southwestern States Association of Ice Cream Manufacturers, was in Milwaukee last month long enough to visit the plant of The Olsen Publishing Co. and tell of the plans for the joint convention and exhibition to be held on the coast in December. That it promises to be the largest gathering of ice cream manufacturers ever held in the Far West was understood at the outset, and Mr. Kugler says that the Pacific Slope Dairy Show, of which the ice cream manufacturers' convention will be a feature, also promises to be a success in spite of the terrible ravages of the hoof-and-mouth disease. This dread plague, says Mr. Kugler, has taken toll of approximately one-fifth of California's dairy cattle.

The Pacific Ice Cream Supply Men, headed by H. P. Jacobsen, will stage the exhibition in connection with the ice cream men's convention. The Pacific Ice Cream Manufacturers' Association will meet with the California manufacturers.

IMPERIAL ICE CREAM COMPANY HAS SIX WEST VIRGINIA PLANTS.

The Imperial Ice Cream Co. is one of the largest organizations of its kind in the world. The company operates plants at Parkersburg, Huntington, Wheeling, Clarksburg, Fairmont and Grafton, making six plants in all in West Virginia.

The officers of the company are George W. Strong, president; C. T. Hiteshew and J. H. Swager, vice-presidents, and J. H. Randolph, general manager and secretary-treasurer.

The first Imperial plant was erected at Parkersburg in the year 1908. The company now has 23 ice cream plants, located in six different states, with a creamery with three plants under a different name. Nearly every town of any importance in West Virginia is more than fully covered, according to J. H. Randolph, general manager of the company.

VIKING Improves Pumping Service

Put a VIKING rotary pump in your plant and notice the improvement in your pumping. First, its performance is thoroughly dependable. It operates unceasingly for years with slight need for attention.

Then, the type for creameries, food plants, ice cream plants, etc., is bronze-fitted and highly sanitary. It is made to take down in a few seconds for easy cleaning.

For brine circulating, there is a VIKING iron-fitting pump.

Get the VIKING catalog. Order direct from factory or from any creamery supply house.

ADVERTISEMENT No. 2

This series of advertisements is designed to inform ICE CREAM MANUFACTURERS of the unusual methods employed in the production of our POWDERED MILK.

Powdered Cream

Powdered Whole Milk

Powdered Skimmed Milk

How the Fresh Milk is Received at Our Plant

Liquid Cream

Powdered Orange Juice

Powdered Lemon Juice

YOU already know the rigid conditions concerning the farms from which we receive our milk supply. (See our advertisement in last issue of this publication.) The next step, then, is the manner in which the milk is received at our plant.

As each farmer's wagon arrives at the receiving platform, the cans are removed and the milk in each can is inspected, weighed and sampled for butterfat. At regular intervals each patron's milk is inspected for sediment, and acidity. All milk found to contain sediment or showing a high acidity or a temperature higher than 60° F. is re-

jected. All milk is also subjected to the Breed Method test for bacteria count, and if this test reveals a high count the milk is rejected. When the whole morning's milk has been received, a composite test is taken and this test must confirm, accurately, the findings of the several individual tests, or a re-check is made all along the line by our Control Laboratory. Thus the milk, from model sanitary farms, is received and started in its process to the powdered form.

Follow this series of advertisements for a complete record of manufacture. Next month's advertisement will deal with our factory equipment.

Kentucky Ice Cream Industry Rapidly Expanding

New Organization Doing Much to Develop Ice Cream Industry
of Blue Grass State, Which Last Year Produced
3,000,000 Gallons of Ice Cream

ALTHOUGH not among the leading states in ice cream production, Kentucky is the home of some of the industry's most constructive workers. Many ice cream manufacturers in other states are familiar with such men as Charles G. Vahlkamp of Paducah, Hargis Hughes and John Kloecker of Lexington, Harry A. Cuscaden, C. F. Hoppe, W. A. Heuser, W. B. Hurley and Neil Mortensen of Louisville, and even Carlton Ball, in the short time he has been at work as general secretary of the Kentucky Dairy Products Manufacturers, has become well known outside of his state.

The ice cream investment in Kentucky is approximately \$2,000,000. The annual output is estimated at 3,000,000 gallons. There are thirty wholesale factories. It will be well to take note of these figures for there is little likelihood that they will stand long. Kentucky has many natural advantages for the development of dairy manufacturing, particularly ice cream, having a large percentage of that type of population which more largely consumes ice cream in other sections—native Anglo-Saxon stock.

DAIRY development is the urge of the hour in Kentucky. The ice cream manufacturers are working hand in hand with creamerymen for the advancement of their industry. In the April issue of *The Ice Cream Review* it was related how an "Evangelism of Quality" was sweeping Kentucky. Harry A. Cuscaden was one of the

principal speakers at different rallies held in the interest of better ice cream. At one of these meetings Mr. Cuscaden made this remark:

"We hope that the seed we are planting today will grow into a large industrial tree, with its branches extending all over the United States, and loaded down with nothing but quality ice cream. There is no reason why in the next few years Kentucky should not have the lead in quality ice cream."

THE Cuscaden Ice Cream Co. of Louisville is one of Kentucky's oldest plants. It was founded in 1875 by George Cuscaden, Sr., whose death on March 11 was reported in the April issue of *The Ice Cream Review*. He was the first in his part of the country to ship ice cream by rail, and in 1899 he invented a machine for making ice cream in four colors and flavors.

KENTUCKY is the home of Neil Mortensen, who probably was more active than anyone else in the undertaking that led up to the organizing of the Kentucky Dairy Products Association. Mr. Mortensen, who is one of the most popular members of the Southern supply industry, is the head of the Standard Milk Machinery Co. of Louisville. He is a past president of the Dixie Flyers. No one is more interested in the ice cream development of Kentucky and the entire South.

JOHAN KLOECKER is one of the Southern industry's outstanding figures. He is head of the Dixie Ice Cream Co. of Lexington. Mr. Kloecker has been looking forward to entertaining the Southern Association of Ice Cream Manufacturers in his home city, but when the national association voted to go to New Orleans for its 1924 convention he was perfectly willing to hold his peace until some other time. Mr. Kloecker was one of those looking forward to the formation of an effective association for Kentucky.

REQUIRES DEALERS TO MEET PROPER STANDARD.

From a very small beginning, the Steffen Ice Cream Co., Wichita, Kan., has grown to be one of the largest businesses of its kind in the Southwest. N. Steffen is said to have been one of the first men in Kansas to manufacture ice cream. John McEwan of the Steffens Company claims that his company is the only ice cream manufacturing firm in Kansas that requires dealers to be properly equipped to handle their ice cream before being allowed to serve it. The company is operating several plants in Kansas with a total capacity of 220 tons of ice and 6,000 gallons of ice cream a day.

The Dairymen's Manufacturing and Supply Company, St. Louis, Mo., has taken over the manufacture and sale of the Frick reinforced ice cream tub. In building this tub, it is explained, it required heavy duty presses. There are but few cities that have machinery that will handle this job, and as Mr. Frick is in the ice cream business in Texas he found the two businesses were so far apart he could not handle both successfully, so he turned this over to the above company. This arrangement covers both the Frick reinforced ice cream tub as well as the Frick Hoop Co., we are told.

Ohio Ice Cream Industry

Six Hundred Eighty-five Manufacturers Produced More Than 12 Million Gallons of Ice Cream Last Year

OHIO, according to the statistics of the Dairy Division of the United States Department of Agriculture, produced in 1922, 11,140,000 gallons of ice cream. In rank among the states, Ohio was fourth during that year. Reports which have been compiled in the office of the Ohio Association of Ice Cream Manufacturers indicate that the 1923 business exceeded the 1922 by 11 per cent, which would mean that the production during last year in this state was 12,500,000 gallons.

Ohio manufacturers ship ice cream into all of the surrounding states with a large volume of ice cream shipped from Cincinnati into Kentucky. On the other hand, there is considerable ice cream shipped from surrounding cities into Ohio, such as Ft. Wayne, Parkersburg, Wheeling, Pittsburgh, Huntington, etc. Hence it can be reasonably assumed that the ice cream shipped out of the state and that received from outside of the state will approximately balance and indicate that there was consumed in Ohio twelve and one-half million gallons. On the most recent basis of compilation of the population, this would make an annual per capita use in this state of about two and three-tenths gallons.

Some of the largest ice cream manufacturing plants in this state, namely, The Telling Belle Vernon Company, The French Bros.-Bauer Company, The Furnas Ice Cream Company, and the Crane Ohio Ice Cream Company, have been manufacturing ice cream for periods varying from twenty to thirty years. There are some other smaller

companies which have been manufacturing in the same location over an equally long period of time, which indicates that the commercial ice cream business in Ohio has been of as early origin and persevering nature as in any of the other states.

The reports of the State Department of Agriculture in their work of inspection and regulation of the ice cream industry, indicate that there are six hundred and eighty-five licensed manufacturers, many of these are small plants making only that which they retail in their own building. The membership in the Ohio Association of Ice Cream Manufacturers is one hundred and five which plants represent in excess of three-fourths of the total gallonage of ice cream made.

THE Ohio Association of Ice Cream Manufacturers has been a very active factor in the ice cream industry of the state since the winter of 1907. At that time a law was proposed in the Ohio legislature fixing a standard for ice cream. Several meetings of the ice cream manufacturers were held during that winter and an organization finally developed, of which W. E. Telling of Cleveland was made president, Jacob Mandary of Columbus vice-president, and Everett Antrim of Columbus secretary-treasurer. The active men in the association at that time, besides the officers, were: L. W. McCray, W. C. Shorb and Frank French, Cincinnati; L. J. Noaker, Canton; H. C. Hatcher, Tiffin; M. J. Beekley, Dayton; G. B. Antrim, Dayton; L. E. Ellis, Dayton; R. L. Graham, Lima.

These men with others interested in the ice cream business, held intermittent meetings but not regular until the winter of 1914, when R. L. Graham of Lima called a meeting in regard to the difficulties being experienced in express service and the question regarding express rates. At that meeting Mr. Graham was elected president, and J. J. Schmidt of Cincinnati, secretary. Through the period which followed, the association has become more active and increased in membership and strength.

The presidents of the association have been, following Mr. Graham: J. J. Schmidt, S. M. Ross, L. J. Noaker, W. W. Trout, J. J. Hemmer, John Schubach.

The records of the early activities of the association are not very complete and, until 1915, only the memories of those who have been active serve as means of information.

An active interest in the question of legislation in Ohio, as it influenced the ice cream industry, again in 1914 occupied the attention of the association and a legislative committee was appointed who secured the services of an attorney and endeavored to have enacted the improved standards for sanitary conditions in the ice cream plants of the state. This met with only partial success. In the season of 1915, the records show that there was much consideration given to the proper construction of fountain cabinets. A report of a committee at the convention held February 4, 1916, on this question, reads as follows:

"All fountain cabinets should be carefully insulated on all four sides and bottom, with not less than one and one-half inches of solid cork board or its equivalent in insulating efficiency and that they should be so constructed that no cooling properties of the ice used for the

Many ice cream manufacturers often find
summer profits are eaten by winter losses.
The Eskimo Pie plan builds more summer
profits, and insures against winter losses.

We have facts and figures to prove it.

It is easier to sell Eskimo Pie than com-
pete against it, and the profits are greater.

To be sure of profitable winter gallonage
this winter—start profiting from Eskimo
Pie this summer. Costs nothing to find
out. *Send coupon today.*

Wirfs' "Airtite" Cushion Door Gasket

\$AVES YOU DOLLARS\$

Many efficient refrigerating and cold storage plant managers have learned that dollars are to be saved by applying the "AIRTITE" CUSHION DOOR GASKET to the overlap of the doors of the plant.

No. 0 JUMBO

No. 1 LARGE

No. 2 MEDIUM

No. 3 SMALL

No. 4 SPECIAL

The GASKET is a rubberized, insulated strip that is water-proof, tough, yet flexible and resilient, and will last for years. It pays for itself in a very short time by stopping cold air leaks and so reducing the cost of refrigeration.

To prove this—run your hand or a lighted candle along the sides and bottom of your door and feel and see (by the flickering light) the cold air that flows out, 24 hours a day, every day.

Easy to apply
*Simply tack on—
Turn the corners*

PACIFIC COAST PLANS ELABORATE ICE CREAM SHOW.

(Continued from page 44)

and had been making a practice of supplying the entertainment for those gatherings, without any attempt at organization or co-ordination of effort. Several of the energetic spirits each year got together, called for contributions to the entertainment funds from everybody interested and arranged the entertainment features. Since the organization was effected, under the name of the Supply Men of the Pacific Ice Cream Industry, the supply men make their entertainment contributions annually in the form of association dues and the organization handles the entertainment and such other work as might come before it. The annual meetings are held at the same time and place as the ice cream conventions and the supply men have found that much benefit is to be derived from the association.

H. P. Jacobsen of San Francisco, coast representative of the Solar-Sturges Manufacturing Co., is president of the Supply Men of the Pacific Ice Cream Industry; R. E. MacFarland of Los Angeles, representing the Essex Gelatine Co., is vice-president; and Russell B. Tripp, editor of Western Confectioner, San Francisco, is secretary-treasurer. The other directors are Charles M. Lee of the Lee-Greefken Co., San Francisco, J. C. Capron of Los Angeles, representing the Menasha Printing & Carton Company, and Edgar B. McKnight of the O. J. Weber Company of Los Angeles. The organization is a permanent one and meetings of the board of directors are held several times during the year, as occasion may demand. Standing committees on grievances, credit, auditing and entertainment function when called upon and the efforts of the organization are directed toward the "Promotion and Protection of the Ice Cream industry," as announced in the motto which accompanies the association's emblem on its letterhead.

THE ICE CREAM INDUSTRY IN CHINA.

The only ice cream prepared and consumed in China is for the resident foreign population exclusive of Chinese. This is prepared in the few hotels, cafes, clubs and homes devoted to the service and use of the foreigners. The Chinese have an inherent dislike of cold foods and drink which is commonly evident in their universal use of hot tea and boiling water and the absence of the cold water drinking habit. There has been in recent years a large increase in the consumption of bottled charged and flavored waters but it is hardly ever consumed by the Chinese ice cold or is the consumption of these universal.

While other foreign foodstuffs, such as canned goods, raisins, confectionery and fruits are increasingly popular with the Chinese, little or no future is expected for ice cream among the native Chinese due to the above reasons. Additional factors against the increased consumption of ice cream are high cost and limited amounts of milk and cream available, high cost of ice and its limited distribution. Outside of a few of the larger treaty ports ice is a rare commodity in other than the few winter months.

Trials of a Waiter.

Diner (in swell cafe)—I suppose people who dine here carry off quite a lot of silver.

Waiter—Yes, sir; we can't get all their loose change.
—Boston Transcript.

HOTEL ACCOMMODATIONS FOR EXPOSITION.

The hotel facilities of Milwaukee are plentiful and good. The Hotel Committee of the National Dairy Exposition has at its disposal 2,500 rooms, nearly all with bath, southern exposure, and every room in the lot as good as any man could possibly want regardless of his means of luxury and ability to provide it. And this does not in any way interfere with rooms equally as good that will be provided for the thousands of daily visitors. Milwaukee has large and well known hotels, many smaller hotels with 150 to 300 rooms, family hotels and apartment hotels, hotels at \$1.50 to \$10.00 per day, so nobody need worry or fear having to sleep in the park.

To help the committee, the hotels and the business men of Milwaukee, who are organized to make it a personal matter to see every one is happy, every one should send in a reservation request for their room requirements directly, to the Hotel Committee, care of National Dairy Association, 910 So. Michigan Ave., Chicago, or care of Association of Commerce, Milwaukee. Indicate date of arriving, how long you will stay, rate you want to pay, and name any hotel you may know and prefer, and you will be booked to walk right into your room on arrival.

FLORIDA COMPANY GROWING.

When the Miami Ice Cream & Dairy Co. began operations in Miami, Fla., in 1913, it was the only ice cream factory in that city, and it manufactured only ice cream.

In 1919 a second plant was built and is used for pasteurizing milk and cream. A complete line of trucks were added for retail delivery. In 1922 the above company took over the Edgemore dairy, at that time erecting a new, attractive, modern dairy.

The Miami Ice Cream & Dairy Co.'s plant is 100x120 feet, has 54 tons of refrigeration, 24 hours a day, according to E. P. Christiansen, president of the company, who gives the following facts concerning his firm: The company gets its power from a Diesel oil engine which they claim averages one-third the cost of electricity to run; the company manufactures 30 tons of ice a day, eight delivery trucks are in operation, a mechanical washer keeps the cases and bottles in a sanitary condition. One 180-quart freezer and two 10-quart freezers are used for the manufacture of ice cream.

Mean is Right.

The stingiest and meanest man has been discovered. The night before Christmas he told his little boy that Santa Claus was dead.—Pickup.

A Mathematical Method of Determining the Serum Solids in an Ice Cream Mix

At the upper left margin are given sugar alternates from 10 per cent to 15 per cent. Place pencil on 13 per

cent and run to the right until 11 per cent fat, the desired fat in this case, is reached; then drop down until the column intersects the line extending to the right from 11 per cent.

The figure 4.96 is exactly the number of pounds skim milk powder required per 100 pounds of mix if the mix is to be made from milk and cream or cream and skim milk, and to analyze 11 per cent fat, 11 per cent serum solids, 13 per cent sugar, .4 per cent gelatine. (To make the mix 11 per cent fat, 11 per cent serum solids, 13 per cent sugar, .4 per cent gelatine using butter and skim milk instead of cream as a source of butterfat).

The butter contains moisture, an average of about 16 per cent. It will require more powder with such a mix than when cream is used.

Associated with the fat in the upper portion of the table are decimals. In the case of 13 per cent sugar and 11 per cent fat this decimal is .22. If butter is to be used in the mix this decimal must be added to the figure in the main chart below. Then .22 pounds added to 4.96 pounds gives 5.18 pounds of powder necessary to each one hundred pounds of mix to make a mix 14 per cent fat, 11 per cent serum solids, 13 per cent sugar and .5 per cent gelatine if butter and skim milk are used.

Without any calculation the most inexperienced man could immediately, by use of this chart find the pounds of powder necessary to balance the serum solids in any mix.

A NEW PACKING IDEA.

The latest idea in the line of packaging ice cream proposes the packing of the frozen delicacy in a tube made of stout paper, according to a news item appearing in the Philadelphia, Pa., Record. As call is made for this container, the column is cut according to the quantity desired, a cap is placed on the ends of the detached piece and the customer is all ready to eat on the spot or to carry the ice cream home. On either end of the cylinder a slight pressure can be made to force the ice cream up so it will be accessible to the spoon.

SOUTHERN MANUFACTURER RAISES WAGES.

A recent announcement by W. E. Drake, manager of the Union Ice Cream Company, Nashville, Tenn., added pep to all his employees. Every employee who had been with the company for a period of one year or more will receive a 10 per cent increase in salary. Mr. Drake says he "believes in recognizing good and faithful service and showing his appreciation in a substantial manner." In the written announcement, he thanked the company employees for their co-operation and loyalty to the company's interests and asked that they continue to work with him for the best interests of all.

News from the Eastern Front

From The Ice Cream Review's New York Bureau

THE Dairy Made Ice Cream Co. of Paterson, N. J., has finished alterations, construction, installing of new machinery, etc., and now has one of the most modern and complete plants in the state.

Officials have revised their hardening rooms to enable them to handle their large production at the peak seasons in the most approved fashion, without lost motion. They have five of these modern rooms with a capacity of forty thousand gallons in each. They have made valuable additions to their mixing room equipment in the way of glass-lined holders, tanks and homogenizers of latest type, and also have re-arranged their freezing room accommodations, giving them a fine large dairy and commodious room of the most sanitary type, where they have installed eight 120-quart machines of the most approved type, with batch mixers capable of turning out one thousand gallons an hour. All of these machines are run double and empty into glass-lined troughs, the product carried by gravity to the floor below, where it is run off into cans and placed into hardening rooms with the minimum of lost motion.

They have also furnished up a very substantial laboratory, fully provided with equipment of the most approved type. Many radical changes have been made in their engineering department, all tending toward producing the maximum of results, from a manufacturing standpoint, with minimum of effort. The company also is doing some extensive experimenting with iceless cab-

inets, and Mr. Knippenberg reports he is getting very satisfactory results to date.

The Dairy Made Co. has certainly used excellent judgment in the arrangement of its new plant and has the courage of their conviction that, in aiming to supply the wants of the ice cream buying public in its vicinity.

A SMALLER but very compact plant in the same territory (Northern New Jersey) is the plant formerly known as the Taylor plant and now incorporated and known as the Treat Creams, Inc., of Paterson, N. J. This plant was taken over last year by a new company, several of the members of which were for years affiliated with the ice cream industry. Its general manager and chief faction is Mr. Lawson, who is very well known in the trade. This company installed modern equipment, consisting of tanks, viscolizers, pasteurizers and freezers, enlarged their hardening room area, installed portable conveyor breaker, and added several new refrigerated trucks.

They have one of the most complete small sanitary plants in the state; an ideal location with very picturesque surroundings. Mr. Lawson is the personification of good nature and filled with the sole ambition of proving to the people of northern Jersey that while he can't make all the ice cream for that section, he can at least make it as good as can be bought.

Mr. Lawson also is very optimistic about the business outlook for the coming season; in fact that spirit seems to animate everybody in the line in that section. The capacity of this plant is five hundred gallons per day.

ANOTHER North Jersey ice cream plant showing the optimistic tendency of the industry is the recognized and rejuvenated plant of the North Jersey Ice Cream Co. as Passaic, N. J., which has recently been taken over by Mr. Evans, formerly for years superintendent of the Keystone Dairy at Jersey City, N. J.

Mr. Evans has thoroughly renovated the interior of the plant, installing new glass-lined tanks, homogenizer, and four 120-quart freezers and now has a capacity of about four thousand gallons of ice cream a day.

The superior facilities of this plant, which is very complete, its ideal location and direction under the skillful guidance of a man who has proved his merit as an executive, bid fair to make it one of the successful plants

NEW FIELD Opens for Ice Cream Manufacturers

Patented

Consists of revolving tumbler containing six sets of moulds of 12 cones each baking 72 cones each revolution.

Progressive ice cream manufacturers should equip their plant with the "Philadelphia Cone Making Machine" and produce their own cones BECAUSE—

Small investments net big Profits. No extra labor or space—regular salesmen solicit orders — helpers bake cones. Fresh, Crisp, Delicious Cones increase ice cream consumption.

This machine saves time, space and positively produces a better cone at less cost than any other machine on the market — Write for details today.

A GROWING NEED

There is nowhere where the value of dependability and uniformity in cleaning operations means so much as in the ice cream plant.

This is so true that one of the largest producers of milk foods advertise that they spend more time in cleaning than in actual manufacture.

And nothing emphasizes more significantly this growing need for dependable sanitation than does the increasing demand for

in that section of the state. The new management is very optimistic over prospects for the present season.

* * *

C. Mortensen of the Standard Milk Machinery Co. of Louisville, Ky., and past president of the Dixie Flyers, spent a few days in New York recently. Mrs. Mortensen

C. MORTENSEN.

accompanied him and they apparently were having an enjoyable visit. Mr. Mortensen has worked out another very valuable asset to the dairy industry in the way of a new piece of machinery, of which he appeared to be very enthusiastic and judging from the brief opportunity we had for examining the details, it's our opinion and hope that it will do all he expects of it. We don't feel privileged to explain the character of this machine, not having his permission to do so, but we do know that, if it comes anywhere near up to the principle it is intended for.

The Hydrox Company of New York has set a new fad in the "Big berg" by sending out a new fleet of trucks and wagons printed in a very artistic fashion, using their standard colors, lemon, yellow and gold letters with dark green running gears. They have carried out the same color scheme on their side walk signs and are to be complimented on their good taste.

* * *

VERNON F. HOVEY, president of the National Association of Ice Cream Manufacturers, has made the following announcement to The Ice Cream Review:

"The meeting held in Washington was in no sense a directors' meeting, but was simply a meeting of the standards committee, together with a few members of the executive committee. We met with Dr. W. W. Skinner, chairman of the committee on definitions and standards, together with some of his associates, for the purpose of discussing the proposed standard on ice cream.

"It of course goes without saying, that we are opposed to a weight standard, as there is not necessarily any relationship between weight and value, and also because present day equipment makes it impossible to control the weight of our finished product. We have filed a brief with Dr. Skinner, and expect to have a meeting before the complete committee on definitions and standards, when they have their next meeting, which may possibly be in June.

RECENTLY I have not found the time necessary to properly care for all the things that have required attention, so cannot say much regarding the industry in New York state. The gallonage production in the Eastern states speaks for itself, as to the development of the ice cream industry. The business in this continues to thrive, showing consistent gains from year to year, the increase in 1923 probably being about 10 or 15 per cent over 1922.

"If the New York state fellows have achieved anything unusual, it is in connection with cost accounting work. Some fourteen manufacturers, in this state, have adopted a uniform classification of expenses and are making distribution of all overhead expenses in a uniform manner. After the elimination of raw material costs and executive salaries, the statement from each of these plants are being sent to Prof. W. W. Fiske of Cornell University, who, in turn, is getting out a comparative statement, the identity of the different plants not being disclosed. This work should contribute to efficiency."

GETTING READY FOR INCREASED BUSINESS.

The Lake City Ice Cream Co., Jamestown, N. Y., is getting in readiness for the increase in business with the approach of warm weather. This company supplies many surrounding towns and distributes its product to many lake resorts which is the cause of its tremendous increase in business during the summer months. The modern ice cream plant is located at 25 Richmond place, and the most up-to-date equipment is used in the manufacture of the cream. The plant is at all times open to the public and many visitors have been pleasantly surprised by cleanliness of the plant and its sanitary method of manufacture.

STUDENTS SEE ICE CREAM MANUFACTURED.

Every year the students of the University of Illinois tour the farming district of Southern Wisconsin. On their recent tour, they were shown how ice cream is manufactured in large quantities in a modern factory. The student group was in charge of E. A. Stiritz, associate professor of dairying of the agricultural school. They were taken to the Kellogg Ice Cream factory where complete details of ice cream manufacture were explained.

NEW PLANT IN IOWA.

The Crowell Company, Waterloo, Ia., is erecting a new ice cream plant in Oelwein, Ia., at 219 West Charles St. The building will be constructed of brick and tile, and will be 30x40 feet, one story and basement.

The company expects to manufacture 40,000 gallons of ice cream in their Waterloo plant this year.

A ten-ton compressor is included in the new equipment for the Oelwein plant, and Earl C. Glasson, secretary, advises that two 40-quart freezers, and a 100-gallon holding tank will also be added. A refrigerated ice storage, a 1,500 gallon hardening room with vestibule, and necessary sanitary pumps and piping are expected to be installed soon.

EVERY MANUFACTURER IN THE COUNTRY SHOULD BE A MEMBER OF THE NATIONAL ASSN. OF ICE CREAM MFRS.

Carolina Plant Has Impressive Opening

Enlarged Plant of Forsyth Dairy Co., Winston-Salem, N. C.,
is Thrown Open to the Public

PEOPLE who had never before been inside of a dairy plant attended the opening of the enlarged plant of the Forsyth Dairy Co., Winston-Salem, N. C., on the evening of April 8. During this period more than 5,000 people passed through the plant and took away

CHARLES E. LANDRETH.

with them 5,280 slices of "Mystery Brick," the company's special novelty; 4,400 Eskimo pies, 50 gallons of bulk ice cream and 100 gallons of chocolate milk.

The expansion of the Forsyth Dairy Co. makes that plant one of the most up-to-date and modern of its kind in the South. Charles E. Landreth, secretary-manager of the plant, has been widely congratulated upon the completion of the large addition to his plant.

The capacity of the enlarged plant is 3,000 gallons of milk and 2,000 gallons of ice

cream a day. Butter production is about ten thousand pounds a month. Most of the butter and milk is consumed in Winston-Salem and High Point. A very profitable city service is maintained in High Point, a neighboring city of approximately twelve thousand inhabitants. Winston-Salem residents have been educated to drink large quantities of pasteurized milk.

The Forsyth Dairy Co. now is under control of the Carolina Creamery Co. of Asheville, N. C., a concern that began business in 1912 with Curtis Bynum as sole owner. In 1915 a corporation was formed. Mr. Bynum was elected president and Hans Brody was named vice-president.

The Forsyth Dairy Co. was established in the fall of 1918 through the efforts of the Winston-Salem Chamber of Commerce. That city now has a milk supply superior to most cities its size in the state.

CHARLES E. LANDRETH became connected with the Asheville concern and went to Winston-Salem in 1919. He recommended that a subsidiary be formed to take over the assets of the Forsyth Dairy Co. as a whole. The plant was taken over February 1, 1920, with local stockholders retaining their full interest. Mr. Landreth was elected president of the North Carolina Ice Cream Manufacturers' Association at the 1922 convention at Raleigh.

The present officers of the Forsyth Dairy Co. are: Curtis Bynum, president; Hans Brody, vice-president, and Charles E. Landreth, secretary and manager.

At the time the Asheville company took over the business it was confined to the handling of milk and butter, very little ice cream being made. The volume of milk being received then ran between 300 and 400 gallons a day. The business has grown until today the company handles between 1,500 and 2,000 gallons a day. Ice cream is being shipped over a wide range of territory.

A LITTLE more than a year ago the Carolina Creamery Company opened a certified milk and dairy farm seven miles from Asheville, on the Waynesville road, so customers could secure milk produced under prescribed rules and regulations. There was erected on this farm a barn that is the last word in sanitation and modern construction.

This farm was named "Valkyrie Farm," and it is being visited by thousands of tourists that go to Asheville, as well as people from all parts of the country who are interested in the dairy business. Members of the International Dairy Council, which recently held a conference in Washington, went down to Asheville to see this farm.

The milk on this farm is produced from a herd of registered Guernseys, the foundation stock of which was purchased from a leading New York breeder.

WHY ICE CREAM IS NOT COMPETING WITH SOFT DRINKS.

(Continued from page 12)

And if the clerk is very busy, the customer may stand around shifting from one limb to another and, in disgust, just pick up a package of candy from the fountain, drow down a nickel and dime and pass out. The clerks—the fountain people—have made it so easy to buy, you know—easy to buy things besides ice cream.

Ice cream has to be good. It has to have a decided taste appeal. It has to have a reputation for purity and wholesomeness. Otherwise, it would not have one ghost of a show in competition with the scores of things that clutter up the average soda fountain, either on the fountain itself or on the large shelf behind it, over which there generally are mirrors where the soda fountain people write such things as "Cold Pop," "Try Our Whatsa-Cola," "Everybody likes Blue River Special," etc. Seldom is there anything about ice cream.

OCCASIONALLY some "live" ice cream manufacturer co-operates with his retailers by preparing window displays. Too many, however, won't bother about this matter.

When the thing is sifted to the bottom, we find that the ice cream industry has no one to blame but its own members for the stiff competition they meet. We have folded our hands and let the dealers and the soft drink people have their way. Now, we must either be up and doing and get out after that business that the soft drink people find so easy to get or hold our peace. None of us can have any quarrel with the soft drink people; we cannot blame them for getting the business they have developed, but we can blame ourselves for sitting idly by

and wondering why in the name of heck we can't make people understand why they should eat ice cream every day for health and satisfaction when the beverage people are getting the public to that very thing when they have nothing to feature in their advertising except such merits as "thirst-satisfying," "delicious and refreshing," "hits the spot," "makes you call for more," etc., etc.

WE UNDERTOOK to get our readers to tell us something about methods of meeting this situation. All agreed that the ice cream industry must co-operate with retailers and encourage them to push ice cream at least in proportion to the effort they put behind other merchandise; must advertise ice cream, its palate appeal as well as wholesomeness, and must keep everlastingly hammering away at the development of winter consumption.

Here are some of the things readers have to say:

Shreveport, La.

In reference to ——— as a competitor of ice cream, it is the strongest competition that we have, but I believe that we are gradually taking inroad on the consumption of ———.

We are doing quite a lot of advertising, backing our advertising with quality and service. This, it seems to us, is the best medium to fight any competitor.

We are now packing ice cream in small packages for the consumer, and with the advent of the refrigerated cabinet, I believe we will be able to put ice cream in all of the suburban grocery stores throughout this section.

This is about the outline of our 1924 operations to overcome the competition of soft drinks.

Campbell's Ice Cream Factory,

W. W. CAMPBELL, President.

Corsicana, Texas.

Re-Coca Cola Competition.

There is no doubt but that the soft drink is a competitor of ice cream in a way, yet in the warmest weather, the general idea is a "thirst quencher." and, of course, one cannot really call ice cream a "thirst quencher." It is therefore necessary that the ice cream manufacturers use advertising both personal and publicity, informing the public of the delicious, thirst-quenching, body-building qualities of a real true fruit ice cream soda.

Furthermore, if the ice cream manufacturers will use a great deal of good display advertising on his dealers' back bars he will see an added advantage. You have perhaps noticed the great many that come up to the soda fountain and when asked their desires, will stand and gaze around and say, "Oh, I don't know, I guess you can give me a soft drink." Now, there is no doubt but that they came to the fountain with an open mind and with simply an idea of "something cold" and, upon looking around for suggestions, see the ever present ——— advertising.

It is our opinion that ice cream manufacturers could stimulate this business a great deal by co-operative advertising; especially informing the public the value of ice cream as a food and body builder; Coco Cola was put on the market and was universally used in a very short time, all by good advertising.

Frick Ice Cream Company,

J. E. BASTON, Sales Dept.

Monroe, La.

We are indeed very glad to see The Ice Cream Review interested enough in this subject to discuss it through your magazine. This is a subject that we have given serious thought, being the greatest menace and the hard-

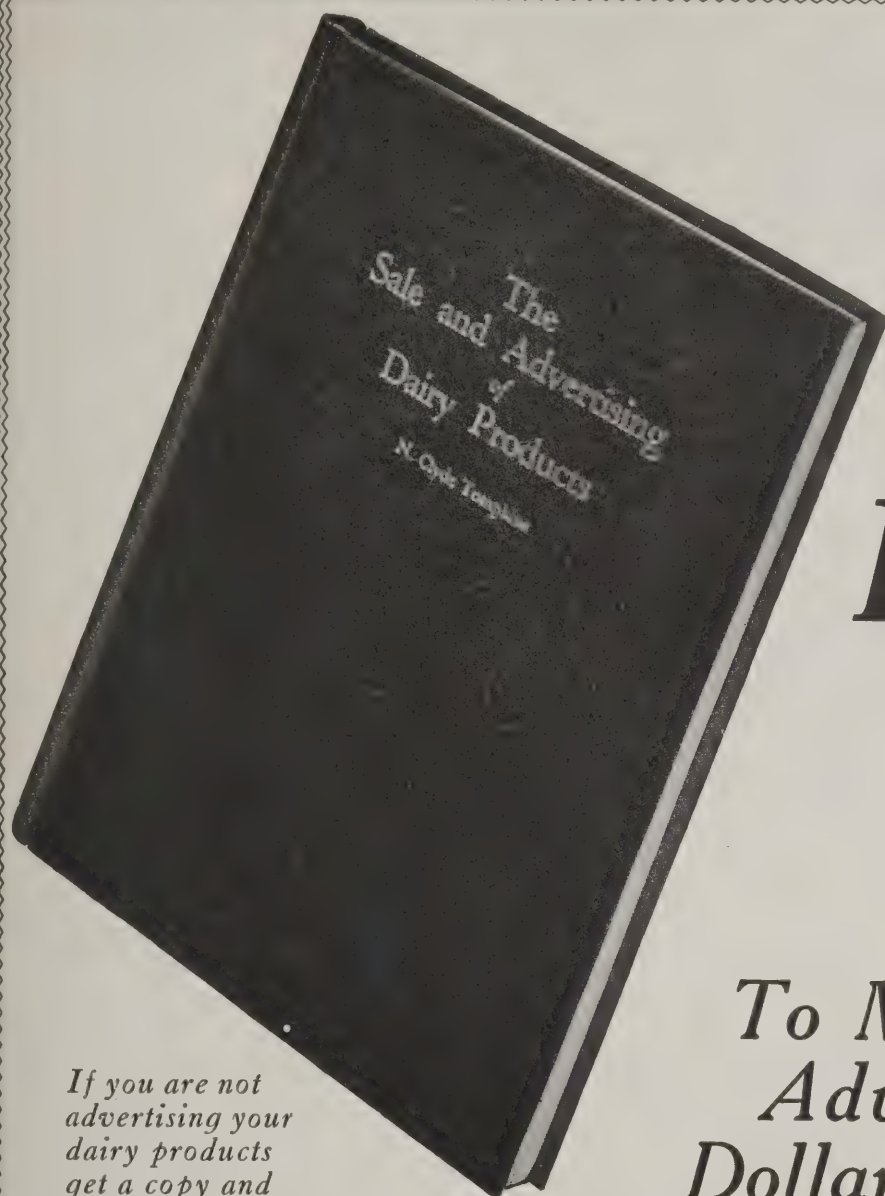

Why Richmond Cedar Does Not Rot

The gigantic cedars from which Richmond White Cedar Tubs are made come from an immense swamp. These white cedars practically grow in water. Only a wood with tremendous moisture resisting qualities could survive in an environment like this. It's the natural saturation with resin that preserves this wood indefinitely. And it does not lose this quality when cut and put to commercial uses. Its lightness of weight and ability to resist moisture and great strength makes an ideal tub.

For fewer replacements order a quantity of these tubs now.

est, most unworthy competition that the ice cream manufacturer in the South has to contend with. There is no reason, from any reasonable standpoint, why there should be more soft drinks consumed than ice cream.

But there is a great deal more of it consumed for the following reasons:

First—One certain soft drink must contain a drug that is temporarily stimulating, as this is one of its noticeable effects, this stimulating quality creating a nervous desire for more in all who drink it, both men and women. The writer rarely ever touches the drink, and to take a bottle today would result in a sleepless night, which proves in itself that it is not healthful. As to food value, we are unable to see where there could be any. Therefore, it is in our estimation, a drink sold to millions of people who never derive anything but harmful results from it.

Second—The popularity of the drink is due further to the fact that it is locally and nationally advertised in every conceivable form, being in all probability the most highly advertised product on the market; and, as everybody knows, continuous, attractive advertising gets results.

Third—As to why more of this drink is sold in the South than ice cream: The ice cream manufacturer has done very little local advertising and little, if any, national advertising. On the other hand he has centered his activities on his fellow ice cream manufacturer, seeming to consider him his biggest competitor and ignoring the greater menace of the soft drink, and by so doing put out a cheap product in whose favor very little, if anything at all, could be said in the way of advertising.

But to overcome this competition is, to our minds, an easy matter, requiring time of course, and co-opera-

tion among ice cream manufacturers, as we have the advantage over soft drinks in every sense of the word, providing all manufacturers will make GOOD ICE CREAM that will stand the test of vigorous advertising.

We believe that the shortest route toward bringing ice cream into its own for the manufacturers to co-operate as mentioned above and put through the legislatures in each state a law that will require pasteurization and a high standard of butterfat and total solids and absolute sanitation in every respect. From our experience in the ice cream business we believe that the most satisfactory grade of ice cream, from the standpoint of both manufacturer and consumer, is an ice cream that contains twelve per cent butterfat and thirty-eight per cent total solids. This is a rich, well-balanced product, not only delicious but high in real food value, not so rich, however, as to tend to cut down the consumption as in the case of any over-rich product, a little of which goes a long way. On the other hand, it is rich enough and delicious enough for kings and queens to eat.

The making of such a product will create a growing demand that will gradually take the place of inferior products, and with the proper local and national advertising, with a strict obedience to the laws suggested, the ice cream industry will grow in such proportions in the next few years that this particular soft drink will no longer be a competitor and will be practically forgotten by the public as well as the ice cream manufacturer.

Yours very truly,

Orvin-Kent Ice Cream Co., Inc.,

J. H. ORVIN.

* * *

Springfield, Tenn.

We are in both the ice cream and bottling business and the answers to the discussion are not hard.

The first question, "Do you think — is a serious competitor to ice cream?"

As we all know, the soft drink is here to stay; therefore we must look at it from a standpoint of trying to help convince the manufacturers of soft drinks to use better and make better drinks. A lot of the bottlers are trying to make drinks with cheap extract and a low sugar content and every way to make a cheap drink. Now, if the ice cream men will get after the bottler and show him the value of quality and try to get him to use at least 32 degree syrup and make a quality drink, that will get the public to ask for more; they will not only build the ice cream trade up but get more people to places that handle both ice cream and drinks.

There is only one reason that in some places the drinks get ahead of the ice cream and that is where there has been some of the cheap ice cream sold. I meet this in our town where there is some cheap cream coming in, but every place that there is quality ice cream, you do not see very much of the bottler getting your trade. There are a good many things to do to get the people to like ice cream if it is not of a standard, but if they eat good ice cream and it is at their service when they call for it, they will not leave it for soft drinks of any kind. As for the food value of this soft drink, if it is made as it is supposed to be, it has a food value, but when you come to class it with ice cream—I mean at least 8 per cent ice cream—it has not the food value that the ice cream has. Eight per cent ice cream with 32 or 34 per cent solids has by far more food value than 6 ounces of soft drink if they do use 32-degree syrup.

The way I am going to meet the soft drink competition is with quality ice cream and not only start and get them with quality ice cream, but give them quality all

the way, and if every ice cream manufacturer will do the same thing and not fall off for at least one summer, he will soon have his soft drink competition to one side so that the trade that soft drinks get would not eat ice cream if it were free.

Yours very truly,
Velvet Pure Milk & Ice Cream Co.,
RUSSELL A. SMITH

NEW YORK PLANT CHANGES HANDS.

Arrangements have been completed for the purchase of the Geneva Ice Cream Company, Geneva, N. Y., by the Rochester Ice Cream Company, Rochester, N. Y. The Rochester concern took over all the stock of the Geneva firm, which included the plant at Geneva, is the information received from Rochester. Only minor changes will be made in the plant, according to S. T. Nivling, president of the Rochester Ice Cream Company. Mr. Nivling advises that their branch at Geneva will be consolidated with the Geneva Ice Cream Co., and the name, "Geneva Ice Cream Company," will be maintained in that city.

DAMPIER SUPERINTENDS NEW YORK PLANT.

C. P. Dampier, superintendent of the Anheuser-Busch Company, New Orleans, La., has left "America's most interesting city" and now is in New York as superintendent of the new Anheuser-Busch plant, which is in operation on 164th and Brook Avenue.

C. P. DAMPIER.

Mr. Dampier has added considerable prestige to his established reputation as an authority on America's frozen food product since his efforts in the South were in accord with the most discriminating requirements of the trade, featured by a quality ice cream product — together with a service, second to none. His many friends and associates wish him a continued success in the Eastern metropolis, where the "A.-B." plant

as built under his recommendations as to exclusiveness of design, equipment, etc.

ICE CREAM TRANSPORTATION DEMONSTRATED.

Evidently the Kirk-Maher Co., Inc., Malony, N. Y., believes in demonstrative advertising, for it recently gave an interesting illustration of the latest equipment for transporting ice cream on the main thoroughfare of their city at the busiest hour of the day. At midnight a fleet of three motor refrigerators paraded the streets. These trucks were recently acquired to distribute Purity Ice Cream to branches at Saranac Lake and Massena. They have the brine system refrigerating bodies.

Master—"What would your father pay if he owed the baker three pounds seven, the butcher four pounds one and fivepence, the milkman—"

Boy—"Notthink, sir; 'e'd move."—The Passing Show (London)

NATIONAL CONVENTION—NEW ORLEANS—NOVEMBER 17-20, 1924.

1—Pen Pressure and Position Adjustments

2—Fountain Pen Point

3—Fixed Pivot

4—One Size Chart

5—One Turn Chart Holder

6—Improved Case

Inside the case you will find the reason for the extraordinary ruggedness and accuracy of TAG Recorders. By reason of a patented cam arrangement, the TAG is the ONLY Recorder with uniform chart graduations for ALL ranges. A special seasoning process prevents "setting" of the spiral spring. The development of a single-piece welded bulb and of a capillary tube of exceptionally fine bore are other TAG achievements. The following distinctive structural features also contribute to TAG superiority.

1—Pen pressure adjustment and pen position adjustment, the latter providing an exact and convenient means for correcting accidental bending of pen arm.

2—Fountain pen point writes a clean sharp record line and requires less frequent filling. The non-corrodible pen arm is inverted so that ink cannot run down into operating mechanism.

3—Accuracy of time indications is assured by mounting pen arm on a FIXED pivot so that pen point will always follow radial lines of chart (with clock stopped). Positive pen-arm stops, specially designed clock, convenient clock starter-lever are other features.

4—By standardizing on one best size of chart, manufacturing costs have been reduced making possible unusual refinement of construction at the usual price.

5—Improved chart holder, secured to case by light chain, is attached and removed with a single turn. Charts are printed in green ink on specially seasoned high quality ledger paper.

6—Improved case construction incorporating moisture-proof feature, if desired.

TAG DIAL-INDICATING Thermometers embody the same improved construction and operate according to the same reliable principles as TAG Recorders. The exceptionally easy reading dial is a feature.

News of Interest Concerning What Our Readers and Advertisers are Doing to Develop the Industry. We Invite Correspondence Relative to New Products and New Equipment.

NIZER CORPORATION APPOINTS DISTRICT MANAGERS.

The Nizer Corporation, Detroit, Mich., has announced the appointment of two new district managers and the acquisition of a new salesman. L. A. Forsyth has been appointed

L. A. FORSYTH.

manager of the Chicago district office of the Nizer Corporation, to supervise sales and service throughout the states of Illinois, northern Michigan, Nebraska, Wisconsin, North Dakota, Iowa, Minnesota, South Dakota and western Indiana.

Mr. Forsyth has been in the dairy industry as a sales engineer, plant engineer and service engineer for over 14 years. His connections with Carnation Milk Products Company, The Creamery Package Manufacturing Co., and other nationally known concerns, have given him an extensive acquaintance throughout the United States.

Officials believe that, "because of his experience in practically every phase of dairy industry," he will be able to render valuable service to dairy

products manufacturers. The Chicago sales and service office is located at 816 Sharples Building, 565 Washington Boulevard.

* * *

F. B. Ruoff has been appointed manager of the New York district office of the Nizer Corporation. Recently he was manager of Division No. 3 for the Eureka Vacuum Cleaner organization. Previous to his work with Eureka he was sales manager of the Klaxon Company making Klaxon horns.

Mr. Ruoff's knowledge of merchandising should make his assistance in the building up of ice cream volume worth seeking by manufacturers of ice cream and other dairy products, officials believe.

The territory covered by the New York office includes Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New Jersey, Delaware, New York (east of Syracuse), Maryland (east of Hagerstown), Pennsylvania (east of Huntindon), Washington, D. C., and Virginia.

The Nizer New York sales and service offices have been opened at 944 Marbridge Bldg., 34th and Broadway.

F. B. RUOFF.

Lewis C. Chamberlin, until recently with the Frigidaire, has joined the sales organization of the Nizer Corporation, manufacturers of Auto-

matic Iceless Ice Cream Cabinets, according to announcement, and will be available to ice cream manufacturers in the following states: Lower Michigan, eastern Indiana, Ohio, western Pennsylvania, western New York and West Virginia.

Mr. Chamberlin has had long experience in the dairy industry. The connection with which he was most widely known, was the A-B-C Refrigerator Truck Body made by Anheuser-Busch, Inc., St. Louis, Mo. He also was connected with the C. Nelson Manufacturing Co. of St. Louis.

He will make his headquarters in Detroit, at the plant of the Nizer Corporation.

LEWIS C. CHAMBERLIN.

A NEW PINEAPPLE PRODUCT.

J. L. Philpneau, 246 Water St., New York City, is offering to the ice cream trade a pineapple product from which the moisture has been removed in a manner, it is stated by the company, which preserves the fresh pineapple flavor. It is concentrated about eight times the strength of the ordinary juice, contains no preservative, artificial coloring or additional sugar, in fact, no other substance has been added, we are told. If any ice cream manufacturers desire to try out this product for the manufacture of pineapple ice cream, and will be willing to give the company their unbiased opinion of it after using, J. L. Philpneau will send them samples free of charge for the asking.

* * *

REPAIR PLANT.

The Bristol Co., Waterbury, Conn., manufacturing recording instruments and distributing radio equipment, has leased 2,740 sq. ft. in the Larkin Building, 3617 South Ashland Avenue, Chicago, in order adequately to take care of the Middle West business, which has grown to large volume according to officials of the company. Most of this area will be devoted to repairing and recalibrating Bristol instruments sold and used in the Chicago territory, but some will be used for stocking made-up instruments for quick deliveries and various lines of radio merchandise, they say. The present salesroom and offices of the Bristol Company will be maintained in the Monadnock Building.

ANNOUNCEMENT OF A NEW HOMOGENIZER.

The Creamery Package Mfg. Company, 61-67 W. Kinzie St., Chicago, announce the placing on the market of a new machine to be known as the CP homogenizer.

The distinctive feature of the new homogenizer, we are told, is in the construction of the homogenizing head. This is similar to a safety or relief ball valve held closed by a

powerful coil spring, adjusted to open at any specified pressure depending on the results desired. The material of the ball valve and valve seat is Stellite metal—a material so hard that it cannot be machined but must be ground to its final shape and finish, according to officials. The valve and seat are practically non-wearing.

Another distinctive feature, claimed for the machine, is the cylinder construction. The three cylinders are made of high tensile strength hydraulic bronze cast en bloc and machined and bored from the solid casting. This eliminates the necessity of separate discharge and suction headers with their attendant joints.

The new homogenizer is built in a full range of standard sizes and is designed to sell at a moderate price. Complete description can be obtained by addressing the manufacturers.

McCORMICK ORGANIZES MIDWEST GLACIFER CO.

The Midwest Glacifer Company has been formed to handle distribution in the Middle Western states for The Glacifer Company of Somerville, Mass., and Philadelphia, Pa. W. B. McCormick, well known in the dairy manufacturing industry of the West, is in charge of the company as president and general manager.

The company is expecting to handle a large volume of business in the middle West. Mr. McCormick has just established Milwaukee headquarters and entered upon his duties of explaining to ice cream manufacturers why Glacifer packers keep ice cream in good condition, without ice or salt, from 15 to 36 hours.

The Glacifer dry packers, widely used in transporting ice cream, are a real connecting link between the manufacturer and the dealer, it is pointed out by Mr. McCormick, especially in

cases where there have been installations of iceless cabinets. The territory of the Midwest Glacifer Company embraces Wisconsin, Illinois, Iowa and Minnesota. Mr. McCormick

reports that much interest has been aroused in the tub, which weighs only 90 pounds when fully packed with five gallons of ice cream and is ready for shipment. A recent ruling by the Interstate Commerce Commission requires dry packers to be filled at 25 per cent less than actual weight, which makes the express billing rate of the Glacifer packer only 68 pounds, this applying in interstate and intrastate shipments. This saves an express rate, the company states, of from five to ten cents a gallon.

Glacifer packers are supplied for brick as well as for bulk ice cream. They are constructed of a seamless tube of heavy gauge, hard vulcanized fibre. Corkboard is used for insulation. The inside of the package is finished with a complete metal liner of rust-resisting material. A hard bottom is used and electrically welded galvanized hoops. The cover is hard wood and locks in place with a simple spring latch. The refrigerant is enclosed in a sealed metal drum, small, compact, and easily handled. This drum is removed from the packer and placed in the hardening room to be frozen. There is no magic in the Glacifer—merely the adaptation of a well-known principle of refrigeration.

* * *

SHIMP SANITARY NON-LEAKABLE VALVES.

"They do not leak," this is the slogan adopted by the Shimp Manufacturing Company of Minneapolis. This company is manufacturing the Shimp Sanitary Non-Leakable Valve used in creameries, milk plants and ice cream factories and, according to Mr. Grostephan, secretary of the company, the slogan means just what it says—that the valves will not leak. These valves are used as inlets to large vats and glass lined tanks, as well as outlets for transportation tanks. They connect up closely, prevent freezing and are easily installed, we are told. They are also used in the freezing room on the line through which the mix is drawn to the freezer, and in various other ways. The Shimp type of valve does away with the usual loss of a pint or more of mix in the pipe leading from the main feed line down to the freezer, for the valve is in direct line with the main feed pipe. These valves are now being used in several large ice cream factories.

Omaha, Neb.

NEW PORTABLE PUMP.

The Alsop Engineering Co., 49 West 63rd St., New York City, manufacturers of the "Hy Speed Portable Mixer," now is putting out what it claims to be a very handy portable electric pump.

This pump, illustrated below, is made of bronze, and is driven by a strong, air-tight motor with fully enclosed gears, and is designed for long and continuous service, according to officials of the company. The handle makes it convenient

to carry to any part of the plant where liquid is being used, for transferring from one tank to another, or from barrels to tanks or vice-versa. The company supplies 15 feet of flexible hose and the machine can be connected to any lamp socket. The price is \$115 complete with switch and cord, ready for operation.

* * *

NEW ICE CREAM CABINET SERVICE.

A consulting engineer in Chicago has inaugurated an ice cream cabinet service which he is offering to ice cream manufacturers. This service consists of furnishing to the ice cream manufacturer what is called the Irefrette Fridgers direct from the factory at a low cost and which the ice cream manufacturer uses to mechanically refrigerate his cabinets and ice cream delivery trucks.

It is claimed that the new system will cut the cost of selling and delivering ice cream in half. Mr. Wolf claims to have spent a great many years in the development of this system and has many machines in use that have been giving satisfactory service for the past five years. Among other things claimed for the new system are: To attract new dealers on five year contracts; 100 per cent new stops between present ones; save 14c per gallon delivery expense; dry up and make old cabinets last; banish forever the salt and ice havoc; salesmen on trucks—not strong arm icemen; sell ice for \$4.00 now given away free, new Fridgers paid from savings made.

The Fridger consists of a coil of bright smooth pipe, easy to bend into circles around the tops of the cans in the shapes of figures eight. These are placed four layers high in which subzero alcohol is circulated by pumps usually located in the basement and connected to the cabinet in the cellar. The refrigerating unit is automatically controlled and operated by a one-quarter horse power motor. We are told that the complete operation is circulation of cold alcohol at a very low pressure and temperature and that there is no loss of alcohol or oil, no adjustments to make and nothing to rust or wear out in less than twenty years time. Anyone interested in this may write to Fred W. Wolf, 1347 N. State St., Chicago, for complete details.

* * *

NEW VISCOLIZER DESCRIBED IN BULLETIN.

Announcement has been made by the Cherry-Bassett-Winner Co. and the John W. Ladd Co., well-known dairy supply houses, that a bulletin on their new viscolizer recently has been issued. The bulletin describes the machine as being heavy in construction and equipped with special valve, gauge, crankshaft, cylinder heads, cylinder valves, and other points "which make it excel." The viscolizer valve is said to be made of viscolite metal which virtually eliminates re-grinding. This metal has been tested for a period of two

NIZER CORP. ISSUES BOOKLET.

Nizer Corporation has just issued a new booklet on the
Nizer cabinet. It is beautifully illustrated and gives a brief
history of the automatic refrigerated cabinet and a lot of
other information about electric cabinets that is well worth
having. There is information in this booklet that would be
very useful to ice cream manufacturers who are having dif-
ficulty in convincing retailers that they should buy the cab-
inet outright. The company will be glad to send a copy to
anyone on request.

OHIO ICE CREAM INDUSTRY.

(Continued from page 128)

purpose of keeping the ice cream hard be used for cooling other materials, except that which is the natural surplus refrigeration running from said cabinet."

This would indicate that at that time there was beginning to be rather an active interest in questions of icing service. In fact, it is one of the first records found in this office of the discussion of that subject which later began and still is, a very live question.

IN 1916 we find that considerable activity was carried on by the association to prevent what appeared unwarranted increases in the rates by express companies of Ohio on both ice cream shipments and returned empties.

During the year 1918, much consideration was given to uniform cost accounting and, though no record here indicates how satisfactorily this was accomplished at that time, there is indication of considerable thought. During the period of the war, it seems that the association was especially successful in its efforts to protect the ice cream manufacturer in the many matters which were involved at that time, and particularly in regard to the procurement of supplies and the arrangements for transportation of ice cream.

In 1919, arrangements were made with the Ohio Milk Distributors' Association and the Ohio Association of Creamers Owners and Managers for the employment of an active secretary who should devote his time and energy to the services of the three associations. Naturally this enterprise brought forth more activity and more interest in the association, and since that date considerable has been done for the promotion of the industry in this state.

During the legislative session of 1920 and 1921, it became quite necessary to secure active resistance to proposed legislation which was unwarranted in its demands upon the industry. Through the very active work of the association, a law was passed establishing an 8 per cent butterfat standard with a standard for some other ingredient set forth and very rigid and complete sanitary requirements for the plants with a provision for a license fee of one dollar and a half per gallon capacity of ice cream freezers, which fee creates a fund to make possible the rigid enforcement of the law. Since that time, the association has been active in the co-operation with the department of agriculture in bringing about enforcement of the law and the consequent development of the industry. It has been considered by the ice cream manufacturers of Ohio that that law was and still is, one of the progressive statutes regulating the ice cream business.

During the past few years, the association has been active in the development of regular meetings for groups within the state, through which much has been accomplished promoting the industry, and during the past few months the activity has been especially centered upon ways and means of obtaining an active outlet for and trials of the mechanically refrigerated cabinet without inflicting unfortunate and unfair competitive situations throughout the state. A careful survey of the situation in Ohio indicates that there are now in use throughout the state, approximately four hundred of these cabinets which are giving a very fair test of their effectiveness and a satisfactory outlet for the cabinet manufacturers. These are centered quite largely in three or four cities and the balance of the manufacturers are securing infor-

mation in regard to these machines which will be of tremendous value not only to themselves but to those manufacturing such cabinets.

The officers of the association at the present time are as follows:

President—John Schubach, Sanitary Milk Company, Canton, Ohio.

Vice-President—Everett Antrim, Furnas Ice Cream Co., Columbus.

Treasurer—George Horen, Ohio Toledo Ice Cream Co., Toledo, Ohio.

District Chairmen:

District No. 1—L. F. Monte, Marion, Ohio.

District No. 2—R. L. Graham, Lima, Ohio.

District No. 3—J. H. Schindler, Telling Belle Vernon Co., Cleveland, Ohio.

District No. 4—B. A. Milliken, Youngstown Sanitary Milk Co., Youngstown, Ohio.

District No. 5—J. J. Hemmer, Hemmer Ice Cream Co., Zanesville, Ohio.

District No. 6—J. J. Schmidt, Cline Ice Cream Co., Athens, Ohio.

District No. 7—W. C. Shorb, White Ice Cream Co., Cincinnati, Ohio.

District No. 8—L. E. Ellis, Gem City Ice Cream Co., Dayton, Ohio.

The board of trustees are made up of chairmen who have been elected in the eight districts of the state, which districts are so arranged that they cover a territory of natural competition or approximately equal division of the number of ice cream plants throughout the state. In these districts, regular meetings are held approximately every six weeks, with the exception of the active production months during the summer.

* * *

Cleveland, the fifth city in the United States, has forty-three licensed manufacturers of ice cream. Of these, eight do by far the largest volume of business. The total gallonage of ice cream manufactured in the city is approximately four million gallons per year, with virtually all of it consumed within the Metropolitan area.

Cleveland is surrounded by such cities as Lorain, Elyria, Akron, Canton and Youngstown, each of which cities do a large shipping business. With a population of close to 950,000 people, it would be indicated that there is an average consumption during the year of nearly four million gallons per capita. This, perhaps, is as high as any city of comparable size in the United States.

* * *

Columbus, with a population of approximately 300,000, manufactured in 1923, 2,400,000 gallons of ice cream. A large shipping business is done by the largest manufacturing plants in Columbus, they serving considerable territory in the central and southern part of Ohio, as well as West Virginia. In proportion to population, Columbus perhaps ranks among the most important cities of the country in its ice cream business.

NEBRASKA'S FIRST ICE CREAM.

A reader recently asked The Ice Cream Review for information concerning the first ice cream made in that state. Information furnished by R. E. McGinnis, secretary of the Nebraska Ice Cream Manufacturers' Credit Association, indicates that as long ago as 1883 or 1884 ice cream was being made and sold to dispensers by Wolz & Balduff of Fremont, Neb. Later on, so far as Mr. McGinnis could learn, the firm dissolved, Mr. Wolz continuing the Fremont business and Mr. Balduff going to Omaha to open a plant there. Mr. Wolz still is in business in Fremont.

Get a Good Ice Breaker—Get a CREASEY

DON'T say, "Oh, there is nothing much to an ice breaker," and find later on that you have made the mistake of buying a source of expense—that the cheap breaker fails right in the middle of a busy day and has only a short life.

During the past 20 years we have built the MAJORITY of all the ice breakers that are in service today and we have kept Creaseys constantly in the lead by such features as the Creasey socket-held pick, the movable semi-steel front plate and interchangeable combs which regulate the size of the broken ice, hopper bottom for machines delivering into chutes, semi-steel drums, independent motor drive, etc.

Many users have confirmed their first selection of the Creasey ice breaker by repeat orders, as:

HOW ICE CREAM CONES ARE MADE.

Modern factory methods tell the story of the advancement of the cone industry. In view of the fact that ice cream men of the country at this time are giving more or less thought to pushing the popularity of the ice cream cone, it is believed that much interest will be felt in a description of one of the country's largest cone manufacturers, the Consolidated Wafer Co., whose plant

Ice Cream Cone Machine

in Chicago recently was visited by a representative of The Ice Cream Review. Max Goldberg, vice-president of this company, has taken an active interest in recent movements looking to the spreading of public information concerning the food value of ice cream cones.

The Consolidated Wafer Co. has approximately one million dollars invested in cone making machinery, offi-

cials of the company say, and it is further claimed that their cones are eaten from coast to coast.

The first process in cone making consists of sifting the flour and forcing it into an automatic mixer into which filtered water is caused to flow. Sugar is added to this base, as also milk in dry form and certain flavoring extracts. The liquid mass flows from the mixer through sanitary pipes to the next floor, where it empties into large tanks near the baking machines.

The baking machines can best be compared to large wagon wheels, about seven feet in diameter and revolving on their own axles. Each wheel is divided into 36 spokes and there is a double iron mold on each spoke. The molds are made in two parts and shaped like the familiar cone, the outside being a cone-shaped cup and the inside a solid cone.

The batter is automatically fed into the machines and is spouted into the succession of round openings. Into each open, cup-like receptacle is inserted the inverted pointed piece of metal which pressed the dough out into the shape of the cone. Rows of these receptacles run across the machine at frequent intervals. One minute and 35 seconds transpire from the time the batter is pressed into the shape of the finished cone, during one revolution of the wheel, until the cone is ready to be dropped. This space of time permits the cone to be well baked, both from within and without. Officials say the machines are the result of many years of experimentation and have been perfected to such a degree that they now run 99 per cent perfect, each wheel turning out 2,000 cones an hour.

A tin form catches the cones in rows of six after baking and carries them down to the next floor, where they are dropped into perforated paper racks. The keeping qualities of cones are determined by the fact that they are packed immediately, in addition to the care with which the wheat is grown and the method followed in blending and seasoning the flour. The Consolidated Company operates its own wheat farm to obtain a selected flour of the quality desired.

DIXIE FLYERS NOT TO EXHIBIT AT NATIONAL CONVENTION.

A letter received by The Ice Cream Review just as the last form of this issue was ready for the press gives strong assurance that the strongest kind of co-operation is being carried on in the interest of making the New Orleans convention the most enjoyable in every respect. We are sorry that the following letter from Harry A. Benners, president of The Dixie Flyers, did not reach us in time to be incorporated in the news article in the first section of this issue, telling of the preparations for the convention, as it explains how arrangements have been made for the various angles of the conventions are to be handled without conflict:

The Dixie Flyers will in no way attempt to stage a show during the national convention, our days being November 14 and 15, after which we will surrender the city to The National Association of Supplymen whom we have pledged to co-operate with in the successful handling of the national convention and I sincerely hope that our joint efforts will result in a feeling of good friendship, peace and harmony between the two organizations for all time to come.

You may state that from a personal visit made by myself as well as members of the several committees to the ice cream manufacturers throughout the Southern territory, at least ninety-five per cent will be present at the Southern convention which should be an inducement to the supply houses to show their products with The Dixie Flyers.

With very kindest personal regards, I am,

Yours very truly,

H. A. BENNERS,

President, The Dixie Flyers.

THE priceless ingredient of any product is the honor and integrity of its maker. If you can depend on the reliability of the House from which you buy, you can be assured of satisfaction.

Into the composition of DERYCOTE Tub and Can Enamel, The National Paint & Varnish Co., has put that dependability and reputation achieved from twenty-one years of satisfactory service, and distribution of "paints for specific purposes."

has given satisfaction because of our desire to live up to our reputation and give you the BEST that years of experience and research can possibly give.

You can soon learn why DERYCOTE does please. Try it yourself.

The "Tank" makes the Cabinet just as the Motor makes the Car

LIKE the motor in your car, to be of real service the tank of an ice cream cabinet must function regularly under all sorts of conditions without an everlasting "tinkering" to keep it in condition.

For example: Only willful destruction with an ice bar can puncture the No. 19 gauge hardened steel tank in Tiffany Cabinets.

The zinc coating on Tiffany Tanks is four times as heavy, because Tiffany tanks are made out of rolled steel sheets, then welded and dipped into a hot galvanizing bath. Most tanks are made out of regular commercial galvanized sheets with only the thinnest kind of zinc coating.

Drain connection is welded directly to tank, and fitted with a $\frac{3}{4}$ " brass drain cock and nipple cast in one piece, making a connection that will not leak and needs no attention.

And the outside appearance of Tiffany cabinets has not been neglected. There is equal value in the case. The class of lumber, design and finish is the best.

Our booklet gives full details of interior and exterior construction. Send for it.

Slogan Campaign Awakens Widespread Interest

Officials Well Pleased with Slogan Contest, Which Results
in Valuable Advertising and Illustrates
Value of Co-operation

WIDESPREAD interest in the campaign for an ice cream slogan is indicated by replies reaching the headquarters of the slogan committee of the National Association of Ice Cream Manufacturers.

Due to the advertisements of the slogan committee and the co-operation of different regional and state associations, the committee has received slogan suggestions from every state in the Union and from Canada, Hawaii, the Philippines and several other distant points.

A bulletin recently issued by E. C. Sutton, chairman of the slogan committee, from his office in Buffalo, declares that a careful check-up on postmarks thus far indicates that mail is heaviest from those states where state associations have been co-operating.

This serves to bring home what the slogan committee had in mind when it launched its campaign. At that time it was pointed out by The Ice Cream Review that not only would the campaign serve greatly to advertise ice cream, nationally, but also it would bring about a splendid object lesson as to the value of co-operation.

"The returns from states where associations are not so active have been lighter, thus indicating very plainly that where proper co-operation is being shown by state associations the manufacturers must of necessity be deriving a direct benefit," the bulletin says. "In other words," it goes on, "where a vigorous advertising campaign is being carried on, manufacturers are securing results in increased business."

AS THIS issue of The Ice Cream Review was going to press there was no way of telling how the total number of replies will "line up," as several manufacturers are having the slogans sent through their own offices.

Mr. Sutton expresses himself as being well pleased with results, as also does Vernon F. Hovey, president of the national association, and N. Loewenstein, secretary.

The New England Association of Ice Cream Manufacturers probably gave more active support to the campaign than any other association. This body sent out more than a million reproductions of the ad which the slogan committee had published in the Saturday Evening Post and the Ladies' Home Journal.

In Buffalo, the headquarters of the campaign, workers last month were distributing material from house to house. A backward spring has not been particularly in favor of the movement at the start, but warm weather was in the offing for the closing weeks of the campaign, which was to end on Memorial Day, May 30.

THE following method of handling the work leading up to the submission of the various slogans to the judges has been announced by Walz-Weinstock, Inc., of Buffalo, which company is handling the advertising of the committee:

As the mail arrives daily, the number of pieces of mail are first counted and a record made thereof. The mail is then sorted by states from which they were mailed and a record is made of the number of pieces of mail coming from each state in the Union and Province of Canada. These statistics will be carried throughout the campaign so that each state association will know the number of replies coming from their state.

Each envelope is then stamped with a serial number, and is being filed in boxes which are securely tied and none of the envelopes are being opened. This plan will be carried forward to approximately June 5th, so as to allow all mail post-marked May 31st to reach the Slogan Headquarters.

Just as soon after June 5th as it is possible to do so, the letters will be opened and the original envelopes in which the letters came will be attached to the letter and slogan. Each slogan will then be typed on a separate card. The cards will then be filed in alphabetical order. When this is done the cards will be submitted to the judges for their decision. The name of the author of the slogan will not appear on the card. In other words, the judges will have no information as to whom the author of any slogan is. When the slogan is selected, they present the card and by referring to the serial number in the files the winner is identified.

A record will also be kept daily of the number of replies received from the advertising done in the Ladies' Home Journal, the Saturday Evening Post and the general publicity.

CALIFORNIA FIRM IN NEW HOME.

The Mission Candy Co., 5,749 Santa Monica Blvd., Hollywood, Cal., is now located in their beautiful new "Mission" home. The company manufactures candy and recently installed complete equipment for the manufacture of ice cream. The plant has a capacity of 200 gallons of ice cream daily, and W. Wallace informs us that the plant is modern and complete throughout. Mr. Wallace advises that the firm has procured the services of one of the ablest caterers in the ice cream trade and only the best merchandise available goes into their product. The company's product is served at eight of their stores located in Los Angeles, San Francisco, and different cities in California.

THIS Tall Tub

has been the first choice of discriminating ice cream manufacturers ever since it was introduced. They will buy no other, for this tub is backed by a three year guarantee. Let us tell you more about it.

Below is the new-style Ice Cream Cabinet we are now manufacturing. It is a vast improvement over the old-style box cabinets. It is equipped with cut steel

WISCONSIN DAIRY INTERESTS LAY PLANS FOR
WORLD'S GREATEST DAIRY SHOW.

(Continued from page 16)

Commissioner John D. Jones of the Wisconsin Department of Agriculture declared that Wisconsin has been so busy building up its mammoth dairy industry it has not had time to stop and visualize what a tremendous industry it has developed.

"People outside of the state know more about it than we within do ourselves," the popular commissioner declared. This gentleman, by the way, was named honorary chairman of the club. Stephen Cramer of Milwaukee was named chairman to preside at the luncheon to be held Thursday noon, May 29. Chairmen for the different luncheons will be named at the end of each. H. P. Olsen, president of The Olsen Publishing Company, was elected permanent secretary.

FOLLOWING the meeting May 15 a committee was appointed to attend the meeting of the Chicago Dairy Club Thursday, May 22, and report to the next meeting of their own club.

A representative of the California Department of Agriculture addressed the meeting and expressed the hope that the hoof-and-mouth epidemic that has wrought such havoc in that state, will be under control in time to allow California to take proper interest in the National Dairy Exposition. John D. Hollowell, manager of the De Laval Separator Co., Chicago, spoke interestingly of the coming pageant.

It is not to be understood that the National Dairy Club of Wisconsin is merely a Milwaukee institution. Every man in the state of Wisconsin and elsewhere interested in the future of the dairy industry is eligible to membership and will be given a cordial reception at every luncheon.

The only thing necessary to be a member is to attend a luncheon. This is the only thing necessary to catching the "dairy show spirit," too.

DRIVERS' STRIKE TEMPORARILY HALTS
CHICAGO ICE CREAM PLANTS.

Ice cream was tied up in Chicago for four days as a result of a decision passed at a meeting of the Chicago Ice Cream Wagon Drivers' Union to cease all deliveries until a definite decision had been reached regarding the wages of the drivers. This ruling affected 357 drivers who were asked to quit immediately. It was reported that some of the largest ice cream manufacturers had cancelled their cream orders and made preparations to shut down their plants.

After several meetings between the Chicago District of Ice Cream Manufacturers, members of which represent 26 large ice cream plants, and officials of the Drivers' Union, a settlement was anticipated which would avoid shutting down ice cream plants. But later negotiations were indefinitely broken off and preparations were made to continue the strike. When the ice cream strike started, Thursday, May 1st, most of the dealers had a two-day supply on hand. No deliveries were made Saturday or Sunday, May 3 and 4, and Chicago "suffered" an ice cream famine which caused children to be sad and grown-ups to realize what it meant to want for an ice cream sundae.

According to J. W. McCarthy, chairman of the union, his members demanded a weekly increase from \$10.00 a week to \$17.00 on their summer rate and from \$21.00 a week to \$28.00 on their winter rate, with an additional

increase in commissions. Officials of the union claimed their requests were justified inasmuch as the drivers had received no increase in wages since 1921, although the price of ice cream had increased several times since then.

After a meeting of the ice cream manufacturers at the Hotel Sherman, it was made public that one driver last year earned more than \$7,200.00, while many of them averaged from \$4,000 to \$5,000.

At a meeting, held May 4, representatives of manufacturers and drivers agreed on a continuation of the 1923 wage scale, with a \$3.00 a week increase for special drivers. The latter will now receive \$45.00 a week. Route drivers will be paid \$10.00 a week in the summer and \$21.00 a week in winter, and a commission of 7 cents a gallon on all goods delivered.

As soon as the agreement was reached, members of the Chicago District Ice Cream Manufacturers' Association ordered their forces to start loading wagons. It is estimated that 100,000 or more gallons of ice cream was delivered on the day following the agreement.

2. Enclosed "Safety-First" gear case. Cut gears run in oil.
3. All brine connections are brass. Durable plug type of valve used.
4. Symmetrical lines of the solid cast, white enameled base adds to beauty of freezer.
5. Heavy tinned copper batch tank complete with strainer has abundant over-capacity.
6. Fruit hopper is separate from batch tank. Feed fruit independently. No leaking.
7. Belt shifter handle within easy reach of operator.
8. Peep hole, covered, to enable operator to watch condition of mix during freezing stage.
9. Head secured by four slotted clamps held in place with tinned brass wing nuts. Head easily removable.
10. Outlet gate designed to empty freezer straight downward into cans.
11. Large square base assures rigidity and no vibration when freezer is running.

A Medium Sized Freezer—MODERATELY PRICED

Has every advantage of larger units—and priced well within reach of every manufacturer. Ask for Bulletin No. 2063 and learn more about this line.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

THE personalities of men, the changings of markets will always enter into the making of terms. But fundamentally one truth holds always: that no terms can fairly place the total risk and burden of a transaction on one party only to it. . . . In all its branches ice cream is a great industry today. In none of its branches is there much room left for the willing worker on the other fellow's capital, the man who sells for spot cash only but must have six months when he's the buyer . . . Good terms are fair terms. Ice cream manufacturers and supply men both, who prosper, make good terms to their customers and then stick to them.

JULY 1924

ICE cream consumption increased about 12 per cent last year. The 1923 output is estimated at 294,000,000 gallons, an increase of approximately 30,000,000 gallons over the output of 1922. This represents a per capita consumption of about 2.66 gallons.

The figures of the United States department of agriculture for 1924 show a considerable gain in the production of the factories reporting, though the total number of reports was less than for the previous year. Conditions last year were very nearly what we are facing this year, and in the light of the substantial gains in production last year it would seem that we have reasons to believe the 1924 production will proportionately increase.

The growth in production should make it clear to all of us that weather should not be regarded as having everything to do with ice cream consumption. Though there is no doubt that warmer weather would have disposed of more ice cream, it has been demonstrated that even unfavorable conditions will not prevent the public from buying ice cream so long as the proper effort is made for business—the public's business. Not the dealers.

ON a short business trip a few days ago we visited several ice cream manufacturers in a northwestern state, where the weatherman has been unable to gain his "batting eye" so far this Spring and Summer. In fact, he skipped Spring entirely and has offered little evidence that he intends to do the right thing by ice cream men at all.

We found these men in an ugly frame of mind, and we couldn't blame them very much. We would much rather hang bunting than crepe, but these men have our sympathy. A greatly decreased demand for ice cream for the season of year is not their only trouble. They have added others because of the first. Each one seems to be trying to boost his gallonage by taking business away from the other fellow, and you know what that means.

One manufacturer told us of a deal which illustrates the general situation. A new confectionery store was to be opened up in a residence district, in fact clear out in the outskirts of the town—one of those little 2x4 affairs, with living rooms in the rear. The proprietor telephoned a couple of weeks before the opening date that he would like to handle the manufacturer's ice cream. Of course, the latter called on the new proprietor and assured him that he would be glad to take care of his needs. The proprietor then asked for a special sign on his building, to extend over the sidewalk. The deal was finally made and the ice cream manufacturer was to furnish the sign at an estimated cost of fifteen dollars. He figured that his profits on the man's business for the first year would probably pay for the sign.

Now, listen to what happened. A few days later a competitor called on this dealer and when he found out the details he offered to paint the entire building, put the sign up as requested, and in addition he promised to put another, and a larger sign, across the front of his store. "He will spend his profits for the next five years to get that fellow away from me, and long before the five years are up the fellow will probably be dead—or bankrupt," was our friend's parting comment about this particular deal.

Why do men who are supposed to have business judgment indulge in such practices? Is it fair to assume that their actions are guided alone by hatred for a competitor? We wish somebody would give us the answer.

YOU will notice that the best thing about critics is—criticism. That is the best thing they do. You rarely or never find a critic who can do much of anything but point out wherein others are wrong. More often he waits until after something has taken place and then he shows how the mistake was made.

How many of us realize that we are very good critics of other people but not of ourselves—of our own actions and policies? Self-criticism of the right kind is rarely ever seen. The fellow who poisons the minds of a flock of your dealers and takes them away from you this summer is a very bad egg, and you don't hesitate to spread the joyful tidings. But when you step in on the other

side of the street and rake over a whole battalion of dealers to your fold you are not doing anything out of the ordinary run of business; of course, you are just pulling a stroke of good business.

"Good business!" How many contemptible things have been done in that name! Nothing covers a greater multitude of sins. The condition is not so bad today as it was in other days, but it is much worse than it should be, and far, far worse than it will be in the sweet bye and bye when men learn that there is nothing to be gained by being unfair to one another. "Good business!" That is the sort of thing that has made short-story writers, literary reformists and yellow newspapers hold up the business man as just a refined sort of bandit. If a man calls you a liar he runs a big risk of having to go to the mat with you. Yet there are times when you wished from the bottom of your heart that you had not made certain unfounded remarks about a companion-in-trade.

We like to criticize—we stiff, proud humans. It is very satisfying to sit down and show how Bill Jones is following the wrong track. But it is quite another matter when Bill Jones shows us that he was right after all and then starts in to do a little criticizing of his own. That is the time when Bill becomes one big nuisance.

If we hate to hear criticism from others so badly, for goodness sake let us save some of that criticism that we spend on others and use it on ourselves. Goodness knows we need it most.

Then maybe we'll stop much of the dirty work that has been going on under the guise of "good business," for by that time we shall realize that it is the worst kind of business—extremely bad business.

MUCH has been said about the ice cream industry's problems. That's the biggest problem that faces the trade magazine. Another of our big problems is the problem of the ice cream manufacturer. They are very closely associated, but are quite different subjects, if you do not know it. Indeed they are.

The manufacturer who reads a trade magazine solely for the good that he can get out of it is trying to work out some of his troubles. The trade magazine would, indeed, be a miracle worker if it could completely ease that man's mind by printing something that would leave the rest of his activities wholly in the direction of making much ice cream and receiving lots of money for it.

We shall make much more progress toward working out the troubles of this industry when we get more ice cream manufacturers interested in the problems of the industry as a whole. You alone don't mean much. The man reading this editorial doesn't count for hardly anything in the affairs of the industry, even if you head the largest plant in the country. When we can get together and work out ways to promote the popularity of ice cream over other competitors, we shall be doing much

to overcome the real problem that affects every ice cream manufacturer in the country. To do this means not only doing the best you can for better ice cream, but also to help see that everybody else does the same thing. The industry will rise or fall on ice cream, regardless of who's to blame.

The trade magazines can tell you much about the production matters that bother you every day, but in the big, far-reaching proposition that counts in the expansion of this industry it can do nothing except help bring together the sleeping power that lies behind the men in this industry who can but don't like to think.

When you go through this magazine in your hands, be sure to read closely everything that affects your business and your peculiar troubles, and make the most of it. But please bear in mind that the most important thing in your magazine is that matter which helps you to consider the troubles of the industry as a whole. It is this which gives you a bigger picture of your industry. It shows you a better place that you can fill, a better work that you can do, a broader, more helpful spirit that you can cultivate.

The trade magazine is merely "a voice crying in the wilderness." The best thing that it does is to point out how manufacturers can work for their own individual, selfish interests by pinning a little more faith to their own industry and a little more charity for fellow members.

The problems of the industry as a whole are what count. The problems of the manufacturers cannot stand when the former are solved.

SOME of these days, not very far away, we are going to pull down the cover of our roll-top desk and go away. We are going due north, up where the tall pines grow and where printers don't holler for copy; where the "muskie" jump into your boat if you don't feed them fast enough; where you sit on the lake shore at eventide and watch the sun sink behind hemlock covered hills; where the black loon challenges the stillness of the night and brings back memories of boyhood days. We are going to forget all about advertisers who are prone to complain about the position we gave their advertisement in last month's issue, and we are going to forget about the subscriber who kicked because we misspelled his middle name, or entirely failed to give him a "personal." We shall refuse to talk with anyone about ice cream mixes, overrun, hardening rooms, deliveries, collections, or competition. We shall look up a place where we can get an inexhaustible supply of good ice cream. That is the only connection with the business that we shall cling to.

We are going to try to pick out a real hot spell for the trip. We want to go when you, dear reader, are working and sweating at least sixteen hours out of twenty-four. Then we shall know that you are happy, too.

ICE cream manufacturers will be perfectly at home at the National Dairy Exposition this year. It is now quite evident that the industry will be widely represented when the dairy clans gather in Milwaukee. Leading ice cream supply houses will have exhibits.

Prominent manufacturers of various sections of the country have signified their intentions to attend. Vernon F. Hovey, president of the National Association of Ice Cream Manufacturers, may be among those present. N. Loewenstein, secretary of the association, no doubt will be on hand. Officers of many state associations of ice cream manufacturers are shaping up plans in this direction.

Even our ice cream friends in the South also are looking forward to the exposition, and it is expected that a large committee of Dixie Flyers will pass through the turnstiles and tell the big world about their plans for a memorable occasion when the national and Southern conventions are held in New Orleans in November.

There is no doubt the dairy exposition this year will be the greatest event in American dairy annals. The setting is superb. It is to be held in one of America's greatest ice cream manufacturing cities. Ice cream delegates will see a good exhibition of supplies, machinery and equipment used in their industry. At the same time they will have the opportunity to inspect some of the highest type plants in operation in this country.

PROBABLY the most misunderstood thing in connection with trade journals is the handling of those interesting items commonly termed "write-ups." It is not clear just how this term ever happened to be coined to apply to trade items of news interest. It is generally used in a contemptuous way.

The dictionary has no such word as "write-up." It does not mean anything. Years ago small town newspaper editors were commonly spoken of as having "written up" something when they were seen visiting a home. Generally they wrote many paragraphs more than was justified by the actual news value of their subject, this to please their readers. At least they thought they were pleasing them.

It has been clearly shown that indiscriminate use of space to describe an event defeats the purpose. Extravagant praise of merchandise seldom makes an impression upon the reader. Truthful, accurate, dignified English is all that is necessary to give the reader an understanding of what you are describing.

The Ice Cream Review conducts a department for the publishing of trade notes—items of interest concerning members of the supply industry and their merchandise. It is one of the most interesting departments in the paper. Information concerning equipment, supplies and machinery offered for the carrying on of this advanced industry should be of interest to every progressive ice cream manufacturer. Every effort is made to keep the items in this department confined to plain, simple, straight-forward statements, with no effort to place upon

the commodity described greater merit than it really possesses.

The supplyman who would ask us to go beyond this point is not the sort of man who gives careful thought to such matters. For this would actually defeat the supplyman's purpose. The Ice Cream Review is a product, just as definite as any commodity sold to an ice cream manufacturer. It must be an honest product. It cannot practice deception and be honest. It cannot give undue merit to one man's merchandise and expect its readers to believe it when it describes other men's merchandise.

These trade items must be brief, concise and make no over-statement. No reputable supply house would let one of its salesmen misrepresent its merchandise. It is the policy of The Ice Cream Review, so far as possible, to see that this is not done in its advertising and news columns. It is not that anyone would deliberately tell a falsehood but that business men usually do not understand news values. News is our merchandise. Each item has a certain valuation. When one item is overstressed it at once becomes cheapened, and whatever event or article of commerce may be described in that item, also becomes cheapened.

The Ice Cream Review makes every effort to keep up with our friends in the supply industry, their new products, changes of location, new officers and representatives, and even with their personal movements to a certain extent. But The Ice Cream Review cannot afford to cheapen itself by making over-statements, and that is the reason why our department for trade notes holds so much interest and profit for our readers.

BULLETIN OF EVENTS

- National Dairy Exposition**—Wisconsin State Fair Grounds and the City Auditorium, Milwaukee, September 27 to October 4. Secretary, W. E. Skinner, 910 South Michigan Ave., Chicago.
- Southern Association of Ice Cream Manufacturers**—Twelfth Annual Convention, New Orleans, November 14 and 15, 1924. Secretary, J. W. Clopton, Decatur Ice Cream & Creamery Co., Decatur, Ala.
- National Association of Ice Cream Manufacturers**—Twenty-fourth Annual Convention, New Orleans, La., November 17, 18, 19 and 20, 1924. Convention headquarters, Hotel Roosevelt. Secretary, L. Loewenstein, 155 N. Clark St., Chicago.
- Louisiana Association of Ice Cream Manufacturers**—Annual convention, November 21, 1924. New Orleans, La. Secretary, N. F. Maning, Monroe.
- Texas Ice Cream Manufacturers' Association**—Annual Convention, Dallas, first week in December, 1924. Secretary, A. J. White, San Antonio.
- Georgia Ice Cream Manufacturers' Association**—Annual Convention, Augusta, Ga., December 2, 1924. Convention headquarters, Richmond Hotel. Secretary, Sam Marshall, Marshall Ice Cream Co., Albany, Ga.
- Oklahoma Association of Ice Cream Manufacturers**—Annual Convention, Tulsa, December 8-9-10. Secretary, W. M. Hawk, Tulsa.
- Pacific Slope Dairy Show**—Exposition under the auspices of the California Dairy Council with co-operation of dairy councils of the Western states and dairy divisions of the agricultural colleges and departments of the Pacific Coast states, Oakland, Cal., December 10 and 16 inclusive. Secretary-manager, Sam H. Greene, 216 Pine St., San Francisco.
- Pacific Ice Cream Manufacturers' Association**—Annual convention, Oakland, Cal., December 10, 11 and 12. Secretary, Bert H. Walker, Tacoma, Wash.
- California & Southwestern States Ice Cream Manufacturers' Association**—Annual convention, Oakland, December 10, 11 and 12. Secretary, Jay Kugler, San Francisco.
- Supply Men of the Pacific Coast Ice Cream Manufacturers' Association**—Exhibition in connection with joint convention of Pacific Northwest, Pacific Coast and Southwestern States, City Auditorium, Oakland, Cal., December 10, 11 and 12.
- Kansas Association of Ice Cream Manufacturers**—Annual convention, Topeka, Kansas, December 16, 17 and 18. Convention headquarters, Hotel Kansas. Secretary, B. T. Perkins, Pittsburgh, Kans.
- Arkansas Ice Cream Manufacturers' Association**—Annual Convention, Little Rock, some time in December, 1924. Convention headquarters, Hotel Marion. Secretary, Charles Hoober, Pine Bluff.
- North Carolina Ice Cream Manufacturers' Association**—Seventh Annual Convention, Charlotte, January 13-14, 1925. Secretary, A. E. Dixon, Fayetteville.

What Burden Should Advertising Carry?

Advertising Has Its Limits in the Ice Cream Industry. What Are They?

By MILES D. ALLEN*

SO FAR as the modern ice cream manufacturer is concerned, advertising and salesmanship have come to take a very important and necessary part in helping to increase the use of the product. In fact, advertising in every field has become the gigantic moving force which is the determining factor as to whether the manufactured article will sell or not. It has oftentimes been stated that anybody can make anything but anybody can't sell everything. This statement was never more true than it is at the present time, when the keen rivalry of competition is so great.

Advertising has steadily grown in value until today it is recognized as the moving force in business which will sell anything so long as the article advertised has genuine merit and is of good quality. However, many ice cream manufacturers have never taken the time nor had the inclination to study enough on the problems of advertising to make a safe and sane evaluation of its merit.

Even today some ice cream manufacturers look upon advertising as a necessary evil in their business which can not seem to be avoided and they enter into it in a half hearted, dispirited manner. The results of such advertising are always disappointing. Salesmen must always be sold on the article they are selling. The ice cream manufacturer must be sold on his advertising to get maximum result.

HALF-HEARTED advertising effort is almost always practically wasted, for by the very fact that it is looked upon as a necessary evil in a man's business, indicates that that particular manufacturer does not realize the value of it and therefore cannot be expected to derive a great deal of benefit from his effort. We have heard it said many times that millions of dollars are wasted annually in advertising, and there is no refutation to this statement, but did you ever stop to consider the millions of dollars that are expended and deliberately wasted each year through other means of salesmanship?

There are reported to be 600,000 traveling salesmen in the United States today. All of these men are an expense and a direct liability to the concern they represent and they are expected to produce results commensurate with their salary and ability. Yet if each one of these salesmen were to save but fifty cents a day on his expense account, it would mean that in one year's time all would save a grand total of \$93,600,000. These are but aggregate figures, yet they say advertising is wasteful and extravagant. The author doubts this assertion, and without casting any intentional reflections on any salesman, he asks the question candidly. Would it not be possible for the majority of traveling salesmen to save their company fifty cents a day by a little carefully directed economy?

Advertising, being a specialized form of salesman-

ship, can be expected to bear its proportionate share of the salesmanship expenses in an organization, but it should not be called upon to bear the burden of the expense expended in other lines.

ADVERTISING should not be looked upon as necessary by any manufacturer so long as it does not bear beneficial and traceable results. In other words, advertising must pay for itself. It cannot lean on anything, it must be self-supporting. If advertising shows a direct loss on an ice cream manufacturers books, and he feels that even though he continues, it will still show a loss, then he should strike it out and not fool with it. But before the manufacturer eliminates advertising, he should analyze the reason why it is not paying dividends for his concern. If he probes into the reasons, he is liable to wake up to the realization of the fact that it wasn't the advertising that was at fault, but it was the way it was carried out. There are several reasons why some advertising campaigns fail to bring the proper and desired results. For convenience, these might be listed under the following headings:

1. Too much effort is expended in too few or too many advertising mediums, and the distribution of advertising effort is not general enough or becomes too general.

2. The advertising campaign is laid out to please yourself, not to please the public or your dealer.

3. You try to please the public without taking any consideration of your own dealer who is your best salesman.

4. Resorting to stunt publicity and novelty advertising before you have developed the result producing types of advertising to their maximum efficiency.

If you have decided on the amount of money you expect to spend on advertising during the year, your first task is to choose the mediums of

advertising which you think will bring you the greatest amount of business for the least amount of money expended. The task of choosing the different mediums is a hard one because there are so many types open for you to consider. As a hypothetical case, let us take an advertising appropriation of fifty thousand dollars and see just how we would lay out the campaign to spend the money to the very best advantage. First of all, we should classify all the advertising under two headings, the first heading being "primary mediums"—or mediums which are absolutely necessary to be used by any concern, and secondary mediums, or mediums which might readily be used to supplement and augment the primary mediums. Under the primary mediums, the writer would classify the following mediums, according to their relative importance:

1. Outdoor display, including painted walls, illuminated and unilluminated city and highway displays, and small signs of one sort or another.

2. Direct dealer literature, including broadsides, letters,

(Continued on page 90)

Is Advertising Wasteful?

THEY say advertising is wasteful—that millions of dollars are spent foolishly each year.

There are approximately 600,000 traveling salesmen in the United States today. If each salesman saved fifty cents a day on his expense account, it would amount to a grand total of \$93,600,000.00 a year.

When you look to the waste in your business, stop to consider every angle of it.

Dixie Flyers to Bring South's Invitation to Dairy Exposition

Committee from the Affiliated Body of the Southern Association of Ice Cream Manufacturers to Spread Tidings About New Orleans' Ice Cream Classic at Dairy Pageant in Milwaukee in September

THE Dixie Flyers will take the trails north and extend the South's invitation to the convention of the National Association of Ice Cream Manufacturers in the fall. Although plans are incomplete at this writing, there is assurance that a large committee of Dixie Flyers will do the honors for the South at the dairy exhibition. C. Mortensen of Louisville, past president of the Dixie Flyers; James J. Harvey and Ben Brown of Atlanta and Memphis, respectively, will be

C. MORTENSEN.

among those to compose the committee and to assure everybody of a hospitable reception when the national association holds its twenty-fourth annual convention November 17, 18 and 19, with the Hotel Roosevelt at New Orleans as the scene of action.

Miss Sally Mahoney of Chicago, president of the Ladies' Auxiliary to the Dixie Flyers and the Southern Association of Ice Cream Manufacturers, and Mrs. R. J. Massey, vice-president of the organization, will represent their association in extending a similar welcome.

The Southern association, as is generally known, will

hold its convention the last two days of the week preceding the national convention, holding sessions on November 14 and 15. The Dixie Flyers will stage an exhibit for this convention. The exhibit will not continue through the national convention, though the Flyers will join with the members of The National Association of Ice Cream Supply Men in entertaining and extending courtesies to the national convention delegates.

INFORMATION concerning New Orleans will be spread at the dairy exposition, which will have the largest attendance of ice cream manufacturers of any similar event in the history of American dairying, according to officials of the National Dairy Association.

The official booth of the Southern Association of Ice Cream Manufacturers will be conducted by The Ice Cream Review, much in the same manner as the one at Cleveland at the national convention last year. Printed information concerning the convention, convention programs, entertainment programs, hotel literature, announcements by Southern ice cream officials, etc.—will be distributed from this booth.

In addition, the Dixie Flyers' committee will pass along the word of welcome to all ice cream manufacturers who pass through the exhibit hall.

Reports from the Southern states show that wide interest is felt over the New Orleans gathering of the national association. The Southern association is expecting the largest attendance in its history on the strength of the honor that has been bestowed upon Dixie by the national body. These delegates will remain over for the national sessions and will assist in every way possible to make the ice cream men from the nation-at-large enjoy their visit, according to Southern officials.

Spend a Week in Dairyland

EVERY dairyman who wants to keep up with the latest inventions in dairy equipment—who wants to reduce his labor costs or improve the quality of his product—will learn more from a visit to the NATIONAL DAIRY EXPOSITION than he can learn in a year in any other way.

Marvelous machines that perform every process in the making of butter, ice cream, cheese, or preparation of market milk, will be shown in bewildering array.

Conventions, meetings and conferences of all branches of the industry will bring leaders from every part of the country.

At the Municipal Auditorium, in the heart of Milwaukee, Dairy Factory Equipment and Supply Exhibits will be displayed.

At the Exposition grounds, Dairy Cattle—Farm and Barn Equipment Exhibits—Dairy Products—U. S. Government Exhibit—College Judging Contests—Boys' and Girls' Club Department—Human Welfare and Nutrition Displays and other departments, will be located.

Additional Reports in Industrial Survey

More Manufacturers Discuss Iceless Cabinets, Icing, Prices, Total Solids, Etc.

IN THE June issue of The Ice Cream Review it was stated that some of the reports received in connection with this publication's industrial survey came in too late to be compiled and would be published in the July number.

Of the late reports only one manufacturer states that he owns outright the iceless cabinets used by his dealers. Of the ten who reported that some of their dealers own their iceless cabinets, two showed an allowance of 10 cents a gallon, and one 20 cents a gallon, and the balance no allowance at all.

Nine manufacturers advise that they do no icing, while some stated that the icing charge was included in their price. Three charge one dollar a week per hole, and two of these make large dealers exempt. One manufacturer charges 50 cents for 100 pounds of ice, one 20 cents a gallon for icing, two 15 cents a gallon, and one 10 cents a gallon.

The average wholesale delivery price of those reporting from California is \$1.33; for Idaho, \$1.23; Maryland, \$1.35; Montana, \$1.20; New Hampshire, \$1.50; New York, \$1.29; North Carolina, \$1.10; Oregon, \$1.15; Virginia, \$1.30; Vermont, \$1.28; Washington, \$1.10; Wisconsin, \$1.00.

The average wholesale express shipment prices for those reporting from each state are: California, \$1.18; Idaho, \$1.23; Maryland, \$1.35; Montana, \$1.50; New Hampshire, \$1.45; New York, \$1.15; North Carolina,

\$1.00; Oregon, \$1.00; Virginia, \$1.00; Vermont, \$1.35; Washington, \$1.00; Wisconsin, 95 cents.

The retail prices, per quart brick, for the different states, averaged from reports, are:

California, 55 cents; Idaho, 85 cents; Maryland, 85 cents; New Hampshire, 70 cents; New York, 60 cents; North Carolina, 60 cents; Oregon, 55 cents; Virginia, 60 cents; Vermont, 60 cents; Washington, 50 cents; Wisconsin, 50 cents.

Per pint brick:

California, 30 cents; New Hampshire, 40 cents; New York, 30 cents; North Carolina, 30 cents; Oregon, 30 cents; Vermont, 30 cents; Wisconsin, 25 cents.

The retail prices per bulk quart:

California, 60 cents; Idaho, 55 cents; Montana, 50 cents; New Hampshire, New York, North Carolina, Oregon, Virginia and Vermont, 60 cents; Washington, 50 cents; Wisconsin, 50 cents.

Per bulk pint:

California, 35 cents; Idaho, Montana, New Hampshire, New York, North Carolina, Oregon, Virginia and Vermont, 30 cents; Washington and Wisconsin, 25 cents.

The percentage of total solids:

California, 36; Idaho, Montana, New York, North Carolina, Oregon, Virginia, Vermont, Washington and Wisconsin, 35.

DIXIE FLYERS TO BRING SOUTH'S INVITATION TO DAIRY EXPOSITION.

(Continued from page 10)

ALTHOUGH The Association of Ice Cream Supply Men was not able to find a hall suitable for its exhibits, this condition does not imply that New Orleans is short in hotel accommodations. The city is equipped with some of the very nicest hotels to be found in any city, and the Roosevelt, the scene of the national sessions, is one of the finest in America. This hotel formerly was known as the Grunewald. It was the gathering place of the Southern association in 1922.

New Orleans ice cream manufacturers are making extensive preparations for the coming of the ice cream men of the nation. The Crescent City, known far and wide as "America's most interesting city," long has been a favored place for the gathering of the Southern ice cream manufacturers. It was in New Orleans eleven years ago that the association was organized, and in that city it has held five sessions since. It was unanimously decided to meet again in New Orleans when the national association decided upon the city as its 1924 meeting place.

Have Safe Temperatures All the Time with Minimum Expense and Care

Outstanding Features of the Climax Model C Rotary Unit

- 1—Rotary compressor a marvel of simplicity—positive and efficient in operation.
- 2—Model C operated by $1\frac{1}{2}$ H. P. motor. No power wasted in belts or other transmission.
- 3—No valves—no small frail parts.
- 4—Only 3 moving parts—all heavy, rugged and permanent.
- 5—Most compact—Model "C" size only 52" long, 21" wide, and 36" high. Weighs only 750 lbs.
- 6—Compressor direct connected to electric motor.
- 7—Continuous flow of gas through the compressor.
- 8—All lubricating oil confined to the high pressure side of compressor.
- 9—No oil can come in contact with liquid refrigerant.
- 10—No violent fluctuation of hands on pressure gauges.
- 11—Simplest starting. Just open water valve to start, close water valve to stop.
- 12—No throwing of electric switches—tightening of belts—or clattering of valves.
- 13—Nothing to forget. Shuts off automatically in case of failure of cooling water supply.
- 14—Particularly adapted to automatic control.
- 15—All parts made interchangeable.
- 16—Each unit factory tested before shipment to produce refrigeration in excess of its rated capacity.

WHY not settle this Refrigeration question once and for all? You know what it means in your business. You know what absolute control of room temperatures within the seven degree safety range—33 to 40—would mean to you. You know what an improvement it would be to be rid of sloppy, mussy and uncertain ice deliveries. You know how much better, fresher and cleaner you could keep foods—always free from water soaking. You know how easily extra money can be made by laying in stocks of perishable foods at low prices and taking profits when prices are higher.

CLIMAX

Model C Rotary Refrigeration Unit

—is an ideal outfit for many types of businesses. More compact than any Refrigeration Unit has ever been before, we also believe it is more efficient. Surely it is simpler to install, to operate, to maintain. It will solve your refrigeration problem with minimum expense and care. Our nationwide service organization backed by our \$2,500,000 corporation insures the utmost in service and satisfaction.

Write us about your requirements or send coupon. The services of our engineering and sales department are offered freely without expense or obligation to you. We also make Climax Reciprocating Type Units for larger requirements.

Ice Cream Manufacturers to Visit Dairy Capital

Wide Representation Expected at Dairy Exposition to Study Milwaukee's Highly Developed Ice Cream Industry

ICE cream manufacturers of the nation have their eyes on Milwaukee. The industry is sure to have the greatest representation at the National Dairy Exposition that it ever has had at any previous event of this kind. The exposition will be held Sept. 27 to Oct. 4.

There are many reasons to believe ice cream manufacturers will be interested in Milwaukee and the dairy exposition. Reports to officials of the National Dairy Association and to The Ice Cream Review strongly indicate wide interest. Perhaps the greatest assurance of this, though, comes from the judgment of the ice cream supply houses, who have made large demands for exhibition space this year.

The dairy exposition will be the ice cream manufacturers' only chance to see a national show this year. Many manufacturers will make it convenient to visit Milwaukee and take in the exposition and later on journey down to New Orleans to take part in the convention of the National Association of Ice Cream Manufacturers.

But probably the real magnet that is drawing ice cream manufacturers to Milwaukee and the dairy classic is the fact that this city, widely heralded as America's dairy capital, also is one of the premier ice cream cities of the country, having plants that have developed the science of this industry to a point of highest efficiency.

The ice cream consumption for the nation is something like two and one-half gallons. In Milwaukee, where half of the entire state's 1923 production of six million gallons was made, the per capita consumption is about four gallons. This has been done by plant efficiency, advanced merchandising methods and—quality. Milwaukee and Philadelphia long have been regarded as America's leading ice cream cities. In quality production the Wisconsin metropolis probably is not surpassed by any city, much of its ice cream being shipped great distances into many states in different directions.

IT IS to see Milwaukee's dairy plants that many ice cream men are coming. Stories of these plants have been broadcast far and wide by supplymen. It is generally known that the high standards set by Milwaukee ice cream manufacturers has brought about a condition whereby many retailers cannot get certain brands of ice cream unless they are properly equipped to handle this merchandise. Many stores have had to clean up and adopt up-to-date methods in order to be

served Milwaukee's high-grade ice cream. This has resulted in up-to-date salesmanship.

People from many nations visit Milwaukee's dairy plants every year. The leading ice cream plants of the city each represent an investment of about a half million dollars. Their construction and operation are worked out according to individual ideas of the operators, some of the equipment being especially designed. The fame of the plants has spread to Europe, Asia, Africa and the Latin Americas. Seldom a week passes that someone from other cities or other nations do not stop in Milwaukee to see through the plants. These visitors include school children, college students, distant ice cream manufacturers, bankers, farmers, food experts, welfare workers—all after new ideas on advanced methods in producing "America's greatest food dessert."

Japanese dairy manufacturers come to Milwaukee when they wish to see and study the American idea of dairy production. The ice cream industry in many lands is patterned after ideas gained in Milwaukee.

THE National Association of Ice Cream Manufacturers has found good timber in the dairy capital for its constructive movements. William F. Luick, head of the Luick Ice Cream Co., is a past president of the national association; George D. Mansfield, head of the Mansfield Ice Cream Co., is a former director; Arthur H. Graeszell, secretary of that company, is secretary of the Wisconsin Association of Ice Cream Manufacturers; Walter Bendfelt of the Bendfelt Ice Cream Co. is treasurer of the same association. John LeFeber, head of the Gridley Dairy Co., is a past president of the International Association of Milk Dealers.

Milwaukee has an excellent cream supply. That is the basis upon which quality has been built. The city is surrounded by the most advanced system of dairying practiced anywhere in the world today. For the past half century, southern Wisconsin and adjacent points in other states have been advanced dairying sections. Purebred cattle are raised in abundance. Waukesha county, from which Milwaukee ice cream manufacturers draw largely for their cream, has more purebred cattle than any other county in the country.

Virtually all of Milwaukee's ice cream plants are well worth visiting. One of the largest manufacturers goes

to his office every morning at about 8:30. As samples from each batch of ice cream pass through his laboratory for testing they go into his office, where he personally tastes every sample and passes judgment. That firm alone produced one and one-half million gallons of ice cream last year, shipping some of it as far as the Upper Peninsula of Michigan. The plant is equipped with machinery especially designed by the owner, in addition to the most advanced types on the market.

THE dairy exposition will have a distinct appeal to ice cream manufacturers this year. Thursday, October 2, will be Ice Cream Day at the exposition. On that day the ice cream men will have the limelight and can count upon seeing their friends of different states.

Vernon F. Hovey, president of the National Association of Ice Cream Manufacturers, advises The Ice Cream Review that he expects to visit the exposition. Officials of many other ice cream associations also expect to be on hand. Secretary N. Loewenstein is expected to be among those present. O. S. Jordan, president of The Association of Ice Cream Supplymen, also probably will be on hand.

The word has gone forth that no less than 100,000 people will attend. This will be the greatest attendance on record. Bankers, manufacturers, railroad officials, farm experts and business men interested in the development of dairy prosperity in many sections will be on hand. This wide interest is due to the fact the exposition will be held in the greatest dairy state in the country. Wisconsin is preparing to open wide its doors and show the world what it has been doing in dairying and dairy manufacturing.

People from the South, where dairying has gone forward rapidly in late years, are coming up to see what it is all about. Ice cream manufacturers of that section are among those co-operating with the Southern farmers to get them on the right path in dairying. Bankers of the South wish to study conditions in Wisconsin so they can better prepare themselves to judge as to under what conditions the dairy cow will be a good investment.

NORTHWEST TO BACK PACIFIC DAIRY SHOW.

Ardent support of the Pacific Slope Dairy Show is promised by George W. Weatherly of Portland, on behalf of the ice cream industry of the Pacific Northwest. Weatherly is the pioneer of the ice cream industry of Oregon and Washington and is commonly known there as the "Ice Cream King."

Weatherly has been in San Francisco several days for conference with Sam H. Greene, secretary-treasurer of the Pacific Slope Dairy Show Association, relative to plans for the forthcoming exposition. The Pacific Slope Dairy Show will be held in the Oakland Civic Auditorium December 10-16, 1924.

"The ice cream people of the Northwest are looking forward to a very profitable meeting at the dairy show this year," said Weatherly. "I think you can count on us practically 100 per cent. We did not join with the show last year, but we recognize now that we are an important part of the dairy industry and we shall be with you 100 per cent."

Value of Ice Cream Windows

Results of Display Tests in the Average Small Stores

By H. E. COOKE*

IF EVERY storekeeper realized just exactly what portion of his rent was going into his window he probably would put more stress on the condition of that window. We will take the average small store. It has been proved by statistics that the area occupied by the window is equivalent to approximately ten to twenty per cent of the entire expense of the rental. Now, considering that, if you are getting absolutely no benefit from your window, to begin with, before you attempt to put anything into your store, you have a loss of from 10 to 20 per cent. Therefore, we feel one of the most important places in a store is the store window.

In fact, we have put so large stress in the store window that it has been termed the "silent salesman." By that we mean as follows: People walking along the street naturally look around and find out the most pleasing things to look at. The object of our experimentation and tests is to determine just what part illumination bears in the making of the people to look into windows.

We have run a series of several tests in large cities—some in New York, some in Brooklyn, some in Cleveland, Ohio, and some in Newark, N. J., as a result of which tests we have compiled these statistics. In the first chart I have here we have an intensity of fifteen-foot candles in the show window. At this intensity there were 100 people attracted. That is, one hundred people

* Edison Lamp Works, Harrison, N. J. An address before sales convention of the Breyer Ice Cream Co., Philadelphia, Pa.

of the total number on the street paused to view a display which was being illuminated by light which had the intensity of 15-foot candles.

BY INCREASING this intensity, we found 33 per cent more of the passerby stopped to view this display, when the intensity was raised from 15 to 40-foot candles.

On the other hand, when we raise the intensity up to 100-foot candles, we found 21 per cent more of the people stopped than had stopped at the 65-foot candles. So you can see the direct relation light had to attracting people.

One of the best ways of decorating your show window and causing people to stop and look at what is in the window is by the use of colored lights. Take a display in a confectionery store of select candies. Add a blue background, blue trimmings and you will have a very nice display. If we placed ordinary light—the white light—on that display it would look just exactly as it is. However, if we cast a slightly bluish light upon the entire display, can you imagine how that would raise the attracting powers of that display? We all like color and color is one of the best ways of attracting people to a show window.

Now, to get these results, there must be some definite way of going about putting in the layouts. All these computations have been made by the illuminating engineering of the Illuminating Engineer Society of New York. When an installation is made it is not a hit-or-miss proposition. From tests, surveys and so forth, we have found it and know exactly what will take place if the recommendations are followed out. Here we have a typical layout for a store window. This is the ordinary store window. The entrance is over here on this side; take the length of the window, the width of the window and the depth. By spacing our units equally and placing them at the top of the windows the light will be cast directly upon the display. By using the proper reflections there will be absolutely no light coming into the eyes of the passerby. That is an important fact, because whenever there is a tendency to have a glare on the passerby's eyes there is a tiring effect on the optic nerves.

ATTRACTIVE ICE CREAM BOOKLET.

"Art Creations in Ice Cream" is the title of a very handsome publication recently issued by Moores & Roos, branch of the Crane Ohio Ice Cream Co. of Columbus, O. The story of ice cream as produced in modern plants of today is told in a very appealing manner from cover to cover. The book is handsomely and appropriately illustrated. It goes to considerable effort to dislodge from the popular mind the fallacy that ice cream is just an occasional treat for dessert. Not only does the booklet tell the story of ice cream, but also of the different products which go into the frozen beverage, interestingly describing the respective places in the mix of fruit, nuts, chocolate, vanilla, sugar, etc. In telling of how ice cream is made in its plant, the booklet sets out by reminding its readers that only high scored milk and cream ever enter into its products. It devotes considerable space to describing the careful cleansing processes in the company's plants. Flavors and their combinations are covered in a separate chapter. One chapter deals exclusively with the forms of varieties, showing the many different ways in which ice cream can be served at social gatherings.

THE ICE CREAM INDUSTRY IN MEXICO, CUBA, AND CENTRAL AMERICA.

Mexico.

With regard to the ice cream business in Mexico City, there were approximately five modern ice cream factories in that city (Sept., 1922), according to the Department of Commerce. These concerns deliver ice cream at the house for four pesos a liter (approximately 2.00 U. S. currency per quart). In addition to these large establishments, there are numerous small street vendors who manufacture ice cream and fruit ices by hand process and sell them from small carts.

Ice cream is consumed in Guadalajara and the larger towns of the district in considerable quantities and is becoming more and more a favorite dish.

Panama.

During the last quarter of 1923 a large company installed a plant in Panama for the manufacture of ice cream. The capacity of the plant is about 300 gallons of ice cream daily. It is proposed to supply the cities of Colon and Panama, the Canal Zone, and the army and navy posts with ice cream.

Cuba.

Practically all the important cafes make their own supplies in the way of ice cream and in addition to these there are numerous small makers in nearly all the larger cities and towns, who make cream which is peddled on the streets by vendors with small carts, in Cienfuegos, Cuba. The people of Cienfuegos, as well as other parts of that consular district, do use ice cream very extensively and it is also generally procurable.

Ice cream is retailed by the cafes to their patrons from 20 to 30 cents and over a glass. The street vendors sell it in small cardboard packages or in the usual cones, the price in either case being five cents. There is no regular wholesale business in ice cream except that when the street vendors buy of the makers they usually now pay 50 cents a liter, about, of which they make 16 packages or cones.

There is an adequate supply of fluid milk of medium quality. There is, however, little cream on the milk and it is therefore not separated. It is understood that for ice cream imported evaporated milk in cans is generally used, being cheaper than the milk obtained from local dairies.

Local dairy milk retails at from 20 to 30 cents a quart. Imported evaporated milk retails at about 20 cents a can, which contains about a pint, but in use is mixed with at least equal parts of water.

CALIFORNIA PLANT COMPLETED.

A modern day-light factory has just been completed by the Valley Dairy Co., El Monte, Calif., for the manufacture of ice cream, milk and butter. The factory is completely equipped with the latest type Creamery Package Mfg. Co. machinery and has a daily capacity of 10,000 gallons of ice cream and 3,000 gallons of milk. Products are sold under the name of "Valley Maid" ice cream.

I. Fratkan, formerly of the City Dairy Co., Ltd., of Winnipeg, Canada, is president and general manager of the company, and A. J. Andrews of Los Angeles is in charge of production and sales.

SPEND A WEEK IN DAIRYLAND — NATIONAL DAIRY EXPOSITION — MILWAUKEE, WIS., SEPT. 27 TO OCT. 4.

1—Pen Pressure and Position Adjustments

2—Fountain Pen Point

3—Fixed Pivot

4—One Size Chart

5—One Turn Chart Holder

6—Improved Case

Inside the case you will find the reason for the extraordinary ruggedness and accuracy of TAG Recorders. By reason of a patented cam arrangement, the TAG is the ONLY Recorder with uniform chart graduations for ALL ranges. A special seasoning process prevents "setting" of the spiral spring. The development of a single-piece welded bulb and of a capillary tube of exceptionally fine bore are other TAG achievements. The following distinctive structural features also contribute to TAG superiority.

1—Pen pressure adjustment and pen position adjustment, the latter providing an exact and convenient means for correcting accidental bending of pen arm.

2—Fountain pen point writes a clean sharp record line and requires less frequent filling. The non-corrodible pen arm is inverted so that ink cannot run down into operating mechanism.

3—Accuracy of time indications is assured by mounting pen arm on a FIXED pivot so that pen point will always follow radial lines of chart (with clock stopped). Positive pen-arm stops, specially designed clock, convenient clock starter-lever are other features.

4—By standardizing on one best size of chart, manufacturing costs have been reduced making possible unusual refinement of construction at the usual price.

5—Improved chart holder, secured to case by light chain, is attached and removed with a single turn. Charts are printed in green ink on specially seasoned high quality ledger paper.

6—Improved case construction incorporating moisture-proof feature, if desired.

TAG DIAL-INDICATING Thermometers embody the same improved construction and operate according to the same reliable principles as TAG Recorders. The exceptionally easy reading dial is a feature.

SINCE 1769

Dairy Manufacturing in Honolulu

Climate Makes for Good All-Year-Round Business

By R. P. FAITHFULL

THE Honolulu Dairymen's Association and the Rawley's Ice Cream and Dairy Products Co. are the only two wholesale plants in Honolulu, and the combined output is from 25,000 to 30,000 gallons per month. This figure includes the ice cream that is being shipped to the other islands, as well as what is being consumed in and around Honolulu, army and navy.

About a year and a half ago a third concern started a large combined wholesale and-retail ice cream factory at the corner of Keeaumoku and Beretania Streets, which is a junction where the heavy automobile traffic passes to and from the city. This plant is located about one mile from the center of town. This concern was started by a man by the name of W. G. Rawley and he first called his firm the W. G. Rawley Ice Cream and Farm Dairy Products Co. As the name was so similar to the other concern, which had been in operation for many years, it caused hard feelings and finally wound up in the courts, and the name of the new company was authorized changed to the W. G. Rawley Company.

This concern operated about nine months, but at a very heavy loss, due to the fact that Honolulu, with a population of not over 80,000 people, could not support three large ice cream plants, any one of the three being able to have taken care of the entire business if worked to full capacity. The firm got in debt to such an extent that they made overtures to the Honolulu Dairymen's

Association, who bought 60 per cent of the stock direct from the stockholders, at the then supposed valuation, namely, 50c on the dollar. To avoid confusion in names the Honolulu Dairymen's Association immediately upon taking control, changed the name from the W. G. Rawley Company to the Purity Ice Cream Company, and continued to operate same, under new management, for three months. During that time an absolute appraisal of the plant was made, and after a careful audit it was

* Manager, Honolulu Dairymen's Assn., Ltd., Honolulu, Hawaii.

NEW FIELD Opens for Ice Cream Manufacturers

Patented
Consists of revolving tumbler containing six sets of moulds of 12 cones each baking 72 cones each revolution.

Progressive ice cream manufacturers should equip their plant with the "Philadelphia Cone Making Machine" and produce their own cones BECAUSE—

Small investments net big Profits. No extra labor or space—regular salesmen solicit orders — helps bake cones. Fresh, Crisp, Delicious Cones increase ice cream consumption.

This machine saves time, space and positively produces a better cone at less cost than any other machine on the market — Write for details today.

THE PHILADELPHIA ICE CREAM CONE MACHINERY AND ART METAL WORKS.

68 N. Fourth St.

Philadelphia, Pa.

discovered that the actual valuation of the stock at that time was \$6.00 a share on a par value of \$20.00.

Owing to the inability to make a profit it was decided that the best thing, for the community as well as for the Purity Ice Cream Company, was to consolidate same with the Honolulu Dairymen's Association. This consolidation was effected on March 1 of this year, and we have moved our ice cream department from our main plant to the new ice cream factory, formerly the Purity Ice Cream Co. At the present time the general offices and the ice cream department of the Honolulu Dairymen's Association are located at Keeaumoku and Beretania Streets.

By combining the equipment we are in a position to manufacture up to 1,000 gallons a day. The plant is equipped with the latest machinery, four horizontal freezers, five 300-gallon holding vats, and three good-sized hardening rooms.

NOW, regarding the ice cream situation in general, I wish to state that owing to our climatic conditions we have a fairly good all-the-year-round business, though there is a drop in the winter months of around 30 per cent, due to the heavy rains and cooler weather. Honolulu is becoming quite a cosmopolitan city and all races are learning the value and participating in the consumption of ice cream. We find that the Hawaiians, Chinese and Japanese are heavy users of this product.

We are manufacturing at the present time a very high quality of ice cream and have many compliments from the tourists who visit us as well as from the steamers that touch at our port on their trip around the world. We are enjoying a nice ice cream business with the T. K. K. steamers running from San Francisco to the Orient and the Canadian-Australasian line running from Australia to Vancouver and return, also a small business with the Pacific Mail line. As you doubtless know, the Hawaiian Islands, being a territory, are under Federal laws and our ice cream has to contain 14 per cent butterfat. We are, therefore, manufacturing an ice

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

A Cream Supply that you can depend upon!

Every Ice Cream manufacturer knows that, in order to be 100 per cent. successful in the use of reconstructed cream, he must be sure of two things:

1. **QUALITY**—it must be high and uniform—identical one day with the next;
2. **FLAVOR**—it must be fresh and sweet—free from objectionable acid or scorched taste—approximating, as nearly as possible, the flavor of natural sweet cream.

Obviously, then, only the best is good enough. And in powdered skim milk—as successful Ice Cream Manufacturers have proved, the country over—“the best” means **GOLDEN STATE**. Send today for *free* illustrated booklet.

POWDERED SKIM MILK & PURE MILK FAT

cream that I think is richer than the bulk of the ice cream on the mainland.

We have considerable business on the other islands, which is an overnight run from Honolulu, and ship a great deal of ice cream to the different stores there. In Hilo, Hawaii, which is the second-largest city in the Hawaiian Islands, we have a branch factory where we are manufacturing all the ice cream for that island. Our method is, I think, unique in this particular, that we ship the mix in refrigerated cans to Hilo and keep one freezer there for making the finished product. This considerably cuts down the cost of operating the plant in Hilo and gives us an ice cream of as high quality as that made here in Honolulu.

In addition to the sale of bulk ice cream, the Hawaiian Islands have been right up-to-date in the manufacture of novelty ice creams, such as Polar Pies, Eskimo Pies, Baseballs, Goody-Good, etc., and all these novelties have been received favorably during their life. At the present time there is not much sale for the novelty ice creams, as the bulk of our business has gone back to bulk ice cream.

In the matter of distribution, Honolulu differs from mainland cities, in that we have a great many small retail stores which want to handle ice cream in a small way. In view of this fact, we have never attempted to give cabinet service, for there are too many establishments that sell ice cream from the doorstep in the original tub. At present, with a population of 80,000 people, we have close to three hundred and fifty wholesale accounts. This means that we are putting out a great many deliveries in 1-gallon lots, which considerably increases our cost of delivering here in Honolulu.

Another point that increases the cost of manufacturing here is that we have to import virtually all ingredients used in the ice cream, due to the fact that it

costs us about 6 cents a quart more to produce milk on these islands than it does on the mainland. Last year we paid our milk producers a fraction over 11 cents a quart for their milk, and of course at that price its use in ice cream is prohibitive. Still, with the increased material cost and the increased delivery cost over mainland cities, we are selling our ice cream wholesale from \$1.25 to \$1.60 a gallon, based on quantity.

I MIGHT add a few remarks regarding the Honolulu Dairymen's Association, which is a corporation valued at approximately \$250,000. We have been in business for twenty-three years, and in the milk business exclusively up to about ten years ago, when we went into the ice cream end.

At the present time we are handling the bulk of the retail and wholesale milk in Honolulu, which runs over 300,000 quarts a month. We run the milk department along co-operative lines, getting the milk from over fifty producers, the majority of whom are located within a few miles of our plant. The milk end is run strictly co-operatively for the benefit of the milk producers, while the other end of the business is run for the benefit of the stockholders.

In addition to our milk department we have a wholesale candy factory and are selling candies under the trade name of the Mid-Pacific Candy Factory. This factory was started three years ago at a cost of around \$50,000, and we are turning out over a hundred varieties of candies. The largest end of this business is our pan department, where we manufacture all sorts of pan good, and gum work, such as jelly beans, Boston baked beans, burnt peanuts, marbles, etc. This department, of course, is in direct competition with all the candy manufacturers of the Pacific Coast, but we are meeting this competition and the factory is growing each year.

THE above is a brief history of our association and the ice cream industry in the Hawaiian Islands, but while on the subject I would like to impress on you the fact that Hawaii is not what so many people on the mainland think. A great many people still believe that these islands are only semi-civilized, but at the present time we have a real up-to-date American city in Honolulu. Our telephone and street car systems are unsurpassed in any city of the United States. Our hotels and business blocks are meeting the approval of tourists from all over the mainland. So when visiting the most beautiful islands under the Stars and Stripes, don't look for grass skirts or grass houses, for Honolulu in that respect is no more. The Hawaiians are taking an active part in the social and business community, and Honolulu is rapidly developing into a large business center and a city of homes. Due to the abundance of rain our hills and mountains are always green, flowers bloom in profusion, and the entire islands are really a beautiful garden.

I hope that I have given you the information you desired, but if you want any further details regarding business conditions or any other phase of the life here, the writer will be very pleased to furnish such information to you on request.

ADDITIONAL EQUIPMENT AND FLOOR SPACE.

Steady increase in business has necessitated additional equipment as well as floor space for the Sayre Ice Cream Co., Elmira, N. Y. J. G. Anthony, manager, recently announced the company will double its equipment, and will double its hardening room space. An additional cooler will be erected in the main factory which is located at Sayre. A new ice machine and other machinery will be used in connection with the hardening rooms and ice tanks at Elmira.

The Dairy Industry of the Orient

Japan's Ice Cream Industry

By S. OKIMOTO*

AN EDITOR of The Olsen Publishing Company asked me to write something about the ice cream industry of Japan. I am sorry, however, that I cannot say very much about it, because our ice cream business in industrial form is just started out, and now in the trial stage, even though there are many ice cream makers in small scale.

Perhaps the ice cream department of our milk condensing plant near Tokio, which I established in 1921, will be the first one using the scientific method as you do in your own country in large scale. But the demand

Since people do not know that ice cream can be supplied from a large ice cream manufacturer, every drug store, restaurant, department store, etc., are making their own ice cream, using the primitive tub freezer, and also very well-to-do people are making their own ice cream, with much difficulty.

As this is the condition, our firm intends to make a strenuous effort to replace the old tub-freezer ice cream into the up-to-date brine-freezer ice cream. But one of the difficulties which impede the progress of our indus-

The company's milk condensing factory near Tokio in which the ice cream was established in 1921.

of this product is steadily growing year after year in Japan. I am sure that this industry will be grown in this country as great as in U. S. A. in near future.

As far as our firm is concerned, the first year I started the Tokio plant the maximum daily production of ice cream was only 120 gallons, but it was increased to 350 gallons in the second year. Last year I established another ice cream department in our milk condensing plant, which is situated in northern part of the country, and this year one more ice cream plant is going to be established in the southern part of Japan, here in Osaka. The plant in Osaka is the pure ice cream plant, not belonging to the plant for other products. I am getting busier year after year I should say.

* With the Far Eastern Condensed Milk Co., Osaka, Japan.

Milk Condensing Room.

Freezing Room.

try more or less is the ignorance of our people toward the quality of the ice cream. Added to this, we feel shameful that we have no legal standard whatever in ice cream, as you have in your country.

Probably some of your people will be surprised if I say you can have ice cream in a cone here for only one cent, American money. But it is true in Japan. That kind of ice cream (I don't think it would be called ice cream in the strict sense, but Japanese used to say so) is made of sugared water, with color and cheap flavor.

Most of the ice cream we are making in our plants

Hauling in Milk.

450 Pounds of protection without an ounce of worry

THERE is some satisfaction in knowing that the door service throughout your plant is 100% efficient and when one of the husky boys gives the door a good hard slam (the kind that makes most of 'em rebound) you're saving money because with Jamison doors the harder the slam the tighter the seal. It's all in the hardware!

They have multiple seals between door and frame where others have but one. Automatic self-tightening fastener that gets tighter and tighter and the adjustable spring hinges extending over one-half the width of the door, making the pressure controllable and renewing the seat against the multiple seals of contact. Three times more weight than other makes. All equipment bolted, not screwed to door and frame.

But why argue—so obvious is the superiority of Jamison equipment that one glance will settle your mind on any refrigerator door problem that might arise.

We would like to mail you our catalog Number 11. It is probably the most comprehensive treatise on modern refrigerator doors ever compiled. It will vitally interest anyone contemplating new equipment or replacements.

Send for it today!

is 8-10 per cent in fat content, and is sold for 10 to 15 cents a dish in retail stores.

EVEN at present there are a few Japanese who don't like to drink milk on account of its peculiar flavor, but there is no single exception in admiring the real

taste of ice cream. Especially the children and women are just crazy about it. Winter sale is also increasing every year.

As already stated before, our ice cream plant is one department of a milk condensing factory. We have no difficulty in getting dairy products in every form; we have plenty of them. So far as I know, I don't think there is any ice cream manufacturer in Japan importing his mix from the U. S. A., or any other country.

American people naturally think that Japanese people are the typical nation which does not use milk in any form, and that their diet consists of rice and fish exclusively. But that is the story of our grandfathers' day. The dairy industry of Japan has shown tremendous progress in the last half century. As an illustration, let me quote the yearly production of sweetened condensed milk during the past eight years, from the annual report of the agricultural department of Japan:

1915	87,579 c/s
1916	158,518 c/s
1917	179,838 c/s
1918	254,465 c/s
1919	359,262 c/s
1920	274,024 c/s
1921	266,636 c/s
1922	330,797 c/s

From these figures you might easily imagine that our condensed milk was also exported to Europe during the great war.

The BEST Vanilla Sells the MOST Ice Cream

Nothing takes the place of Michael's Mexican Vanilla

It is false economy to pare pennies when buying Vanilla. Far-seeing manufacturers recognize the wisdom of this. It is a fact that

MICHAEL'S Mexican Vanilla Powder "America's Favorite"

is more than worth the difference in cost. Because, in the end, it actually costs *less*. People unconsciously eat more ice cream when it is flavored with mellow-mild, deeply delicious Michael's Mexican. The average increase in your sales is 25 per cent!

DAVID MICHAEL & CO., Inc.
Front and Master Sts. Philadelphia, Pa.

Make This Test at Our Expense

Place a trial order. Use all you need to give it a full, fair trial. If MICHAEL'S Mexican Vanilla Powder does not produce the finest vanilla ice-cream you ever tasted, return the remainder at our expense, and we will cancel the charge. DO this, by all means.

Building The Dairy Trail

The Dairy Manufacturing Industry Can Accomplish Much Good Work by Encouraging Highway Development, Putting the Farmer Into Closer Touch With Cream Markets and Also Opening the Way of the Ice Cream Manufacturer to New Business

BETTER roads have a more important bearing upon successful dairy manufacturing than is generally understood. Dairy organizations have shown much interest in co-operating with officials for keeping quality standards high, which is as it should be, but it seems that too little thought has been given to working for better highways, for more distribution arteries.

The advancement of dairy manufacturing hinges greatly upon roadway work, as indeed all other forms of industrial development. Better distribution channels are splendid for general business, but they can help no one so much as the people whose plan of business is based upon the dairy cow.

Reflection upon distribution problems gives rise to the conviction that the dairy industry has never made the proper effort toward encouraging better roads. Dairy manufacturers generally understood that good roads mean less wear and tear to trucks, but few consider the many other benefits promised through additional adequate highways.

In sections of the country where population is denser

manufacturers can overcome distribution to a great extent through distributing stations and branch plants, but this only makes it possible to use the truck more in widening the manufacturer's sweep of service.

In the mountain states of the South and the Far West, where scattered population is a serious drawback to the development of the industry, the branch plant idea is almost entirely out of the question; it is certainly out of the question so far as overcoming the difficulties of transportation is concerned.

Good roads mean freer intercourse, and that, of course, means more frequent and rapid exchange of dollars, which is the very essence of good business. Farmers have something to sell, and when they are enabled to get to their markets they turn their produce into cash, which in turn is put into circulation for the good of everybody. The ice cream manufacturers get their share of business from this healthy condition.

To see the important bearing good roads have upon successful dairying it is necessary only to compare those states where dairying advancement is greatest with states

MENTION "THE REVIEW"—IT IDENTIFIES YOU.

where the dairy cow has not been given such a nice reception. Wisconsin, the greatest dairy state in the Union, has a system of good roads that has excited admiration from visitors from everywhere. Minnesota, the world's greatest state in butter manufacturing, has hundreds of miles of wonderfully well paved roads. California, which lately has made a strong bid for dairy honors, has a system of good roads for a foundation for dairying. Ohio, ranking high in the general output of dairy products, is well blessed with good roads. Pennsylvania, the world's leading state in ice cream production, has for many years been active in building better roads. New York follows Pennsylvania in ice cream production, and the fine highways of the Empire State are known from coast to coast.

North Carolina is regarded by many students of economical affairs as the South's most rapidly developing state, if indeed not the entire nation's most progressive state. North Carolina several years ago went to work building up an efficient system of highways to bring its trade markets into closer touch. Not only has it been building better roads within, but lately the Carolinians have called upon highway leaders of surrounding states to "sit in" with them and discuss road-way development, the idea being to get the other states interested in what can be done in this direction so they can co-operate with North Carolina in building supplementary highways and make the good work stretch over a greater territory.

It is significant to note that North Carolina, with its foundation of good roads, is rapidly building up dairying. The people of the mountains have been encouraged to turn to cheese production, and in other parts of the state creameries, milk distributing plants and ice cream

factories are going up. The North Carolina ice cream industry for a long time has been rapidly developing, probably more rapidly than the ice cream industry of any other Southern state.

WHAT have good roads to do with better dairying? It is not necessary to point out that they make for better business conditions. It is easy to understand that in the South, where ice cream consumption is not what it should be in view of its favorable climate, better roads would stir up the circulation of money and boost ice cream sales. It is readily understood that good roads enable dairy plants to reach into new ground, not only to collect cream from farmers and thereby stimulate dairy farming but also to distribute ice cream to new customers.

Territory now wholly inaccessible to dairy plants can be opened through urging legislators and state officials to keep after better roads.

The "Y & B" Corporation of Charlotte, N. C., for twenty-five years large manufacturers of ice, have announced their intention of entering the ice cream manufacturing field on a large scale.

A modern sanitary ice cream plant will be established and facilities for storing and distributing the product are included in the corporation's announced plans of constructing three additional electrically-driven ice plants of thirty tons capacity each. These plants will be located in convenient sections of Charlotte. Ice cream will be distributed throughout southern North Carolina and northern South Carolina, the company has announced.

In announcing its decision to enter the ice cream field the "Y & B" Corporation issued this statement: "The recently completed paved roads radiating from Charlotte make possible the rapid and economical distribution of ice cream by truck."

GOOD roads mean getting more out of a truck, prolonging its life in cases where it is used over roads not so good. They mean making it possible for the truck to go behind the mountains and establish a pathway of trade. It means building up and spreading farther the idea of dairying, and dairying is something that acts and reacts in many different ways for its own good. For it is only in the sections where dairying is established that ice cream is popular. Educating the farmers in dairy facts serves not only to spread appreciation of dairying but also of dairy products and their importance.

The Southern states especially have much to be gained by highway development. Encouraging an-

"SAXMAYER" BUNDLE TYER

Every user of a "Saxmayer" depends upon the perfect knot this machine ties in more ways than one.

It is neat looking, and every business man knows the value of a nifty package, free from trailing, uneven ends of string.

You can always depend upon these knots to stay tied, even when the packages are carelessly handled.

SAVES TWINE AND TIME

You do not need a trained operator for this machine. Anybody can operate it, many times faster and very much better than they can tie by hand, to say nothing about the big saving of string.

PACKAGES — BOXES — BUNDLES

The machine is automatic and ties various sizes and shapes without special adjustment.

Ten Days' Free Trial

We want you to try this machine in your own plant, on your own work.

That is the best way to decide just how much it will save you.

Write us to ship a machine.

The National Bundle Tyer Co.

BLISSFIELD, MICHIGAN

nouncements are made by the highway organizations of many Southern states in the form of plans for increased roadway building.

These new roads will do much to bring dairy cows to the South, and to promote the general scheme of dairying. They will promote business activities of a general nature. And with a dairy foundation established, the Southern ice cream manufacturers will find much more popularity for ice cream.

At the convention of the Southern Association of Ice Cream Manufacturers last winter a member expressed himself as opposed to the suggestion that the association aid in the dairy development of the South. The same member later made the statement that more ice cream is consumed per capita in the Northern states because many people in the North are brought up on a dairy diet, such as cornbread and milk, milk and crackers, etc.

Good roads promise more to the dairy industry than many people in the dairy industry seem to understand.

THE SMALL PACKAGE.

By F. Pace Woods.*

The past few years of depressed buying conditions have been educational, if nothing else. They have proved the value of using the most improved merchandising methods. In fact, it has been absolutely necessary for many companies to develop and use, for the first time, a real selling effort.

Ice cream manufacturers have been no exception to the rule. Necessity has always been the mother of invention. When ice cream manufacturers have needed a means of building business they have developed or found it.

Many have turned to the small package ice cream dainty, particularly the sort that feature their own name or ice cream brand. Invariably, the featuring of such dainties has met with marked success in two ways. First, the dainties themselves have proved profitable and, secondly, it has resulted in adding to bulk and brick sales. As folks have purchased the dainties and have formed a liking for the particular brand of ice cream, they have requested that make of cream when buying bulk and brick.

The small package ice cream dainty has been most successful in those territories where there are many outdoor resorts, fairs, excursion boats, etc. The East and West are particularly successful with the 5c and 10c ice cream packages. California, with its many ocean resorts, consumes great quantities. Large cities, where baseball is popular, use thousands a day.

Washington, D. C., last summer consumed an average of 12,000 a day of a single style. The crowds at the Nebraska State Fair last summer bought more of the same make of cartoned dainties than all the bulk and other ice cream items offered.

Many interesting instances could be related. An Eastern dealer was delivered 15 dozen cartoned ice cream dainties one day last summer. Within one hour the sale had been so rapid, he phoned in his order for 30 dozen more. All of which indicates clearly that the small 5-cent cartoned ice cream item has come to stay.

EVAPORATED MILK ASSOCIATION FORMED.

Representatives of almost all of the evaporated milk manufacturers of the country recently met in Chicago and organized the Evaporated Milk Association. L. R. Hardenbergh of the Carnation Milk Products Co. was elected chairman; C. T. Lee of Nestles Food Co., vice-chairman; E. G. Annell, Oatman Condensed Milk Co. treasurer. Other members of the executive committee are W. T. Nardin, Pet Milk Sales Corp.; C. S. Parsons, The Borden Co.; H. C. Carr, Libby, McNeill & Libby, and J. F. Enz, Danish Pride Milk Products Company.

The association will inaugurate a campaign of education, directed to the housewives of America, featuring the wholesomeness of evaporated milk; and the economy of distributing a billion quarts of milk each year in tin cans.

It has taken more than thirty years of painstaking effort to bring this method of marketing milk to the present high state of perfection. The new, handy, sanitary tin can now in use, makes possible the distributing of milk of the best quality to millions of homes, combining purity with freshness and high quality with lowest possible cost.

Herbert C. Hooks, well known throughout the milk industry, and a member of the committee representing the industry in the food administration during the war, has been selected to conduct the activities of the new association.

Mr. Hooks has been active as a manufacturer of evaporated milk since 1906 when he became identified with the Hires Condensed Milk Co. at Philadelphia. Having served in all the departments of a rapidly growing business, Mr Hooks became general manager in 1911, continuing until 1918 when the Hires Company combined with others to form Nestles Food Co. He recently resigned the treasurership of this company to administer the work of the Evaporated Milk Association.

HERBERT C. HOOKS.

SMALL PLANT OPENED.

A small ice cream plant was recently put into operation in Caruthersville, Mo., by Albert Lawson and John Edwards. Both men have had experience in the manufacture of ice cream; in fact, they are experienced in all phases of the dairy industry.

Two large pasteurizing and mixing machines were installed, and ice crusher, brine tub, cream freezer of ten gallons capacity, etc., with ice storage room, packing facilities, milk containers, and all necessary equipment to produce a quality product. For the time being the company will not install their own refrigerating plant but will depend upon the local ice supply.

You can't afford to miss a single copy of The Ice Cream Review. Did you send in your renewal?

Easy Computation of Mix

This is the Method that was Taught to all Regular and Short Course Students in Ice Cream Making at the University of Idaho During the Past Year

By H. A. BENDIXEN*

THE following reply to an inquiry illustrates how by the use of three simple formulas the amount of each ingredient for any mix may be accurately computed without juggling of figures, whatsoever.

Question: I am using a mix containing 80 pounds sweetened condensed milk, 8 per cent fat, 20 per cent serum solids, 40 per cent sugar; 35 pounds butter, 84 per cent fat; 190 pounds milk, 4 per cent fat; 17 pounds sugar; 1.5 pounds gelatine, 1.5 pounds vanilla—325.0 pounds mix. I would like to make a mix containing about 14 per cent fat, 10 per cent serum solids, 15 per cent sugar. Will you please check my mix and adjust it for me? I would like to have about 320 pounds mix.

Mr. Peterson told me that you were using some sort of formula in calculating your mix. I wonder whether you could give it to me if it is not too complicated. Thanking you in advance and for past favors, I await your reply.

Reply: I have re-calculated your mix and I find the following composition:

	Per cent fat	Per cent serum solids	Per cent total solids	Lbs. fat	Lbs. serum solids	Lbs. total solids
80.0 lbs. sweet. cond.	8	20	68.0	6.4	16.0	54.40
35.0 lbs. butter	84	1	85.0	29.4	.35	29.75
190.0 lbs. milk	4	8.64	12.64	7.6	16.45	24.02
17.0 lbs. sugar	100	17.00
1.5 lbs. gelatine	90	1.35
1.5 lbs. vanilla
325.0 lbs. mix	13.4	10.1	38.9	43.4	32.77	126.52
15.1 per cent sugar.						

Your formula is not far off from the desired composition except in fat where you have 13.4 per cent as against 14 per cent that you desired. The mix, however, should make a very fine ice cream if properly frozen.

I will give you the formulas as I use them and then show you how I solve your problem by the use of the same. The general formulas follow:

1. Pounds condensed, sweetened condensed, or powdered milk or skim milk to be used in the batch: Lbs. of batch and per cent serum solids in batch minus per cent serum in batch times .09.

Per cent serum solids in condensed minus per cent serum in condensed times .09.

2. Pounds cream or butter to be used in batch: Pounds batch times per cent fat in batch minus pounds condensed times per cent fat in condensed minus per cent fat in milk times pounds milk products in batch minus pounds milk products in condensed.

Per cent fat in cream minus per cent fat in milk.

3. Pounds milk or skim milk to be used in batch: Pounds milk products in batch minus pounds milk products in condensed minus pounds cream or butter used.

Milk serum in milk, skim milk, cream or condensed milk includes everything but the fat, in the case of sweetened milk everything but the fat and cane sugar,

SUGAR SURPLUS WILL EXCEED MILLION TONS. Federal Statisticians Predict Huge Carryover Because of Record Cuban Crop.

THERE will be a surplus of 1,364,854 tons of sugar (refined basis) available for the United States between now and next October, predicts Federal Sugar Refining Company as a result of a careful world survey just completed. As a result of this prospect, sugar prices have steadily declined, raw sugar reaching the lowest point since 1922. But despite several drastic reductions, demand has been restricted and buyers have purchased only for immediate needs, being doubtful about future prices.

The Cuban crop will reach the record total of 4,050,000 tons, according to the latest estimate of Federal's representative on the island. This will leave available 1,880,951 tons of raw sugar for the United States until October 1. Adding the balances available from Porto Rico, 141,060 tons; that from Hawaii, 305,630 tons; from Philippines, 149,547 tons, and 2,000 from Virgin Islands and 15,000 tons of full duty sugar to the refiners' and importers' stocks of raw now on hand, makes a total available of 2,761,140 tons. Deducting exports and meltings for the domestic trade (on the same basis last year) the total available on September 26 is estimated to be 1,364,854 tons of refined sugar.

Stocks in Cuba are over a half a million tons more this year than at the corresponding date last year. The estimate as of May 24, including sugar at plantations, ports and in transit to ports totals 1,724,616 tons, against 1,179,847 tons at the same time in 1923, an increase of 544,769 tons. Despite reports of revolution and strikes in Cuba, buyers have apparently realized that a huge carryover is inevitable and prices must stay in line with conditions of supply and demand. Talk of "large" sales of Cuban raw sugar and American refined to foreign markets has also not been borne out by the facts, while the normal season of heavier sugar consumption is approaching, stocks are larger than usual and will go a long way to satisfying any demand in the near future. Conditions during April were such that certain American interests were offering granulated sugar in England at prices nearly one-half cent a pound under prevailing domestic parity.

EUROPE'S 1924-25 beet sugar crop will total 6,770,000 tons if the outturn is based on the 1922-23 outturn and 6,056,000 tons based on the bad European weather conditions of 1923-24. The acreage sown this year exceeds last year's by 21 per cent, 1,975,000 hectares as compared with 1,633,137 last year. Germany reduced its consumption of sugar 300,000 in the five months ending March 1, according to one of Federal's European correspondents. This year consumption was 350,000 tons as compared with 650,000 tons in the corresponding period last year.

The improvement in the English sugar market, expected after the announcement of the new duties, has not materialized.

Stocks on hand May 1 totaled 410,000, about equal to the consumption during the first four months of the year.

Exports of sugar from the United States in the first four months this year were less than a half of those in the corresponding period of last year and about one-eighth of those in 1922, according to Federal's figures.

Don't let that used machinery of yours stand in your way. Turn it into cash by advertising it for sale in the "Review" Want department.

Can Liners and Summer Business

In the heat of summer when cans are most in demand—when the milk-stone just seems to bake to the sides—when the "leavings" in the can become a magnet for flies, then is when the user of

A L L E N One-Piece Sanitary CAN LINERS

appreciates another of their practical angles of real usefulness.

Keeping the ice cream away from the sides of the cans makes them easy to clean. The less time it takes to clean the cans the more they are available for service, and if the dealer junks the can liner as the can becomes empty, he need not be bothered with the annoyance of drawing flies about his place of business.

Let us tell you some more practical uses of Allen One-Piece Sanitary Can Liners.

Ice Cream Industry of the Mountain States

THE discussion of the ice cream industry of the Middle West is temporarily left off at this time to take up the activities of manufacturers in the Mountain states. The Dakotas and Nebraska are embraced in this group because of a similarity of problems. Dairying development is the force behind ice cream promotion in the states of Montana, Wyoming, Colorado, Nebraska and the Dakotas. Not having the heavy centralized population centers of other sections, the consumption of ice cream has not gone forward so rapidly as elsewhere, but in late years this condition has been overcome by advancement in distribution methods and through dairying development.

Good roads have helped in exploiting ice cream. Mountain passes have given way to smooth arteries of travel. The motor and electric trucks have done much to help the situation. As dairying has taken root the milk supply has been better, and quality ice cream has won new customers.

The Mountain states until late years had not gone in so much for co-operative efforts to promote the industry, though Nebraska has an association which has done much for the industry's development in that state. The Nebraska Ice Cream Manufacturers' Credit Association has been a very constructive force. Ice cream manufacturers in every section will do well to study what these gentlemen have done by concerted action for the promotion and protection of the industry. The association has developed understanding. Manufacturers know something about their merchandising field.

IT IS seldom that there is any trouble for an ice cream manufacturer in Nebraska over a bad account. Dealers are given co-operation and at the same time are made to understand that the ice cream manufacturers will not be "worked" against each other for the granting of special favors. The merchandising channel in Nebraska is highly developed. Manufacturers have gone in for intensified salesmanship practices, and the highest order of business methods are followed.

R. W. McGinnis, secretary of the Nebraska Ice Cream Manufacturers' Credit Association, has been a tower of strength in the industry's upbuilding in that state.

Picture to yourself, gentlemen of the ice cream industry, a condition whereby ice cream manufacturers of a given vicinity do not have to trouble themselves over this or that matter which may arise in connection with ethical trade practices, but merely put this in the hands of a party largely responsible for fair play, and you will get an idea of what Mr. McGinnis and the Nebraska association are doing for constructive progress.

L. E. Hurtz of the Fairmont Creamery Co., Omaha, was elected president of the association at the last annual convention and has been most active in efforts looking to better understanding and advanced business practices.

COLORADO called attention to its efforts in the upbuilding of the ice cream industry when the Colorado Association of Ice Cream Manufacturers was organized late in the winter, naming The Ice Cream Review as its official organ and letting the rest of the country know that Colorado intends to make a place for itself on the ice cream map.

The production report of the department of agriculture shows that Colorado manufactured something more than a million and a half gallons of ice cream last year. There is little doubt that the actual figure is nearer two million gallons, and observers of the situation in Colorado believe that, given some good weather this summer

and fall, the 1924 figure will be in the neighborhood of three million gallons.

E. L. Carlson, G. C. Carlson Ice Cream Co., Denver, is one of the moving spirits behind the Coloradans' efforts to boost the ice cream industry in that state, taking the initiative in bringing the manufacturers together. He is secretary of the association. The president is Earl B. Darrow of the Darrow Ice Cream Co., Pueblo, and he is giving much effort in bringing about a condition of good understanding in his state.

MONTANA and Wyoming, since early pioneer days great cattle states, have been rapidly turning from the beef cattle to dairying breeds, and in late years the ice cream industry has shown promise of becoming something of importance in those states. Although there have been group meetings from time to time, these states have no regular state associations, though their ice cream manufacturers have been very energetic in the activities of the Pacific Ice Cream Manufacturers' Association, in which Bert Walker of Tacoma has been such a bulwark

of strength. These states are expected to be well represented at the Pacific dairy classic at Oakland next winter, when there will be a joint convention of the Pacific association and the California and Southwestern States' Association of Ice Cream Manufacturers, in addition to several other dairy groups and a complete dairy exposition.

With purebred dairy cattle being imported into Wyoming and Montana in greater numbers every year, the ice cream industry has every promise of development.

The ice cream industry of South Dakota is covered in a special article.

The Ice Cream Review will resume its review of the ice cream industry of the Middle West in the August issue, taking up Wisconsin, the world's ranking dairying state; Minnesota, Illinois and other states in this group.

Preceding issues have covered the development of the industry in New England, the Middle Atlantic states and in Michigan, Ohio, Indiana, Kentucky and West Virginia.

Ice Cream Industry of South Dakota

Rapid Progress Due Largely to Co-operative Spirit

By C. C. TOTMAN*

THE ice cream industry of South Dakota is developing at a very rapid rate and is without doubt in fair proportion to the population as compared with any neighboring state. According to statistics of the state dairy expert, there has been in the last thirteen years an increase of 112 per cent in dairy production. The gallonage production for 1923 was approximately 1,200,000. The total amount of ice cream used was probably somewhat in excess of this amount, since some of our neighboring states ship considerable quantities into South Dakota. There are some very completely and modernly equipped factories in Sioux Falls, Brookings, Aberdeen, Mitchell, Huron and Watertown.

The first meeting of the ice cream manufacturers of this state was held at Sioux Falls, March 24, 1921. The purpose of this meeting was to organize a state manufacturers' association. Among those who helped to form this organization and who have been staunch members since are: F. J. Herrick of the Turner Creamery Co.

* Secretary, Ice Cream Manufacturers' Association of South Dakota.

of Mitchell; W. C. Gagnon of Huron, S. D.; Mr. Hopkins of Redfield; Wm. Arlt of Rapid City; E. E. Thompson of Mitchell; Mr. Binder of Yankton; Schaefer and Sons of Parker; Mr. Rognes of Madison; Mr. Heckmaster of Canton; I. J. Bibby, A. P. Ryger and Prof. T. H. Wright, Jr., of Brookings. The officers elected at the beginning of the association were: F. J. Herrick of Mitchell, president; W. C. Gagnon of Huron, vice-president; E. E. Thompson, secretary, and Mr. Heckmaster, treasurer.

IT WAS decided during the first year that the annual convention of the ice cream manufacturers' association would be held jointly with the state dairymen's association. This practice has been followed and works out very satisfactorily to both organizations. In April, 1921, soon after the organization of the association, a meeting was called at Huron and permanent officers for the year were elected as follows: Mr. Gould, president; Wm. Arlt, vice-president; Mr. Skoug, secretary, and Mr. Rognes, treasurer. The executive committee consisted of

SEATTLE, WASH.

MAPLEINE

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Mr. Binder, Mr. Hopkins, Mr. Bibby, Mr. Thompson and Mr. Gaggon.

AT THE second meeting, March, 30, 1922, The Ice Cream Review was adopted as the official organ of the association. It was also decided to invite ice cream supply men to join as members of the association, to pay annual dues and thereby assist materially in the strength of the organization. On behalf of these companies who are associate members, the association wishes to express thanks for their liberal attitude and contributions for they are strengthening us and we trust helping to build up the industry in general.

At this meeting officers elected for a year were: I. J. Bibby; president, Wm. Arlt, vice-president; T. H. Wright, secretary-treasurer. It may be said for these gentlemen that their services have been so satisfactory that there has been no change up until the present year, when Mr. Wright moved to Cedar Rapids, Ia., and has been replaced as secretary-treasurer by C. C. Totman of the state agricultural college. At this meeting it was also voted to have the secretary prepare lists of retail merchants who should be placed upon a blacklist of C. O. D. accounts.

This practice has been followed since and the members of the association express themselves as being entirely in favor of it. The names upon the C. O. D. list are changes as accounts are paid and a retailer may become reinstated as a creditable buyer.

THERE are about 35 ice cream factories in the state. Some of these are creameries but make considerable quantities of ice cream in conjunction. Some of the larger manufacturers are: Turner Creamery Co., Mitchell; Crescent Creamery, Fenn Bros., Skoug Bros., Bridgman-Russell, Sioux Falls; M. Langenfeld, Watertown; Binder Bros., Yankton; W. C. Gagnon, Huron; Brookings Creamery, Brookings; Beatrice Creamery, Equity Union Creamery, Aberdeen; Rapid City Creamery Co., Rapid City. Many of these plants are equipped with entirely modern apparatus, such as glass lined vats, homogenizers and good hardening rooms and mechanical refrigeration outfits.

Judging from the rapid development of the dairy industry, South Dakota is fast developing into a good dairy state. The eastern part of the state, in particular, possesses very fertile soil and a good climate, and alfalfa is quite generally grown.

This section is dotted with many prosperous towns and the general attitude of the people is still somewhat of the pioneer brand which denotes industry and progress. Two of the largest cities in eastern South Dakota are Sioux Falls with a population of about 40,000, and Mitchell with about 15,000. Mitchell is the home of the famous annual Corn Palace Exposition and Sioux Falls is the great distributing point for manufacturers as well as the home of many modern factories of various kinds. The ice cream factories are annually increasing their output and many hundreds of gallons are shipped out daily.

Pacific Association Has Done Constructive Work

Gallage in Pacific Northwest Compares Favorably With Other Sections, Considering Climate

By BERT. H. WALKER

THE Pacific Association of Ice Cream Manufacturers was formed in 1916 through the efforts of the late F. M. Foulser and W. A. Otis, both of Seattle. The organization meeting was held at the Hotel Davenport at Spokane, Wash., on Nov. 21 and 22. At that meeting the following officers were elected: F. N. Martin,

BERT H. WALKER

president; H. R. Hoefler, treasurer; Bert H. Walker, secretary; G. W. Weatherly, 1st vice-president; F. W. Henningsen, 2nd vice-president; E. S. Fansler, 3rd vice-president. Following board of directors: A. M. Embry, W. W. Hamilton, Henry Menzel and F. B. Flood. A great deal of credit is due J. E. Dunne of Portland for the organization work. He afterwards served as president for two years.

The original membership list contained some forty names of men in the manufacturing and supply line

in the states of Washington, Oregon, Idaho and Montana. This has grown to a list of nearly 200 during the time intervening, and it's safe to say there are almost that many more in the ice cream business who should be enrolled over the territory. We have several members in British Columbia who are very active in the ice cream industry of the Northwest.

Since that time there has been a great development in the ice cream industry in this section of the country and we can boast of plants that are the equal of any, and a gallage record, considering the population and climatic conditions, that will compare favorably with any part of the United States.

I have no particular information regarding Mon-

tana, Oregon, or Idaho, but it is safe to say they are giving a good account of themselves. British Columbia has also made rapid headway in the industry, having an association in connection with other western provinces, but the western section of British Columbia is pretty solidly allied with the Pacific association.

DID YOU EVER STOP TO THINK

By E. R. Waite, Secretary, Shawnee, Okla., Board of Commerce.

That wherever you find co-operation between manufacturers, wholesalers, retailers and truthful advertising, the results secured will fully demonstrate the value of that co-operation.

Business concerns who are awake to their opportunities never neglect the golden opportunity of truthful advertising.

Business concerns should not be satisfied because they are doing what they call a nice business. They should never be satisfied when they are sure they are getting all the business that it is possible to get out of their trade territory. They should then extend their territory.

To increase business and hold what they already have, business concerns must be continuously recommending through the printed page the lines which they carry.

Every business is a service institution. The more service it can render the more prosperous it will be.

ICE CREAM CO. ORGANIZED.

Petoskey, Mich., business men, farmers and consumers recently organized the Petoskey Ice Cream Co. and elected E. S. Martin, president; Joseph A. Magnus, vice-president, and E. A. Martin, secretary. The company is incorporated for \$10,000.

The company has leased a former printing office in Petoskey and plans are being made to equip it with up-to-date ice cream machinery, including a large cooler, ice making system, and other modern equipment. Butter will also be manufactured by this company.

Hoot Mon!

Butter Scotch Ice Cream

HOOT MON! Here's a Butter Scotch flavor that puts into ice cream that never-to-be-forgotten taste of fine home-made butter scotch candy. No wonder it wins quick popularity wherever introduced.

"Hoot Mon" Butter Scotch does not lose its delicate flavor in the freezing process. Your customers do not need to guess what kind of ice cream they are eating,—they know it's Butter Scotch.

And "Hoot Mon" is a copyright name that fires the imagination of youngsters and older folks too. You'll get a world of free publicity out of this catchy name for your "Hoot Mon" Butter Scotch Ice Cream.

Send us the coupon or wire for quick shipment of your first dozen No. 10 cans of "Hoot Mon" Butter Scotch.

Gaulin Homogenizer
Type 400—Motor Driven
Equipped with 2-Stage Valve
Patent applied for

The Gaulin Homogenizer "STANDARD of EFFICIENCY"

Gaulin Homogenizers are Dependable Homogenizers

THEY are scientifically designed and built by Gaulin engineering experts who have spared no effort in producing a machine to meet every requirement essential to the manufacture of a quality product.

The "Gaulin" has no equal in quality or performance—its *proven superiority* over every other machine of its kind manufactured has resulted in its adoption as standard equipment in the majority of prominent ice cream manufacturing plants in the country, where it has been found to be practically indispensable.

All Gaulin machines are now equipped with the 2-Stage Valve, a recent development which insures a more thorough homogenization of the product than with the original patented Gaulin Spring Valve. This dual valve not only increases the homogenizing efficiency over 100 per cent but is the only device manufactured that *positively controls viscosity*, an essential requirement in the manufacture of a quality product.

The Gaulin 2-Stage Valve is fully protected by patents and cannot be furnished by anyone except distributors of Gaulin Products. Write for our general catalog and literature describing the 2-Stage Valve in detail.

Names of jobbers handling Gaulin products in your territory will be sent upon request.

1925 DAIRY CONGRESS AT PARIS.

At the meeting of the Permanent Bureau of the International Dairy Federation in Brussels, it was decided to hold the next Congress of the International Dairy Federation in Paris, France, in June, 1925. H. E. Van Norman, president of the World's Dairy Congress Association and now actively engaged in the work of the National Dairy Association, of which he is president, with headquarters at the Chicago office, is in receipt of this announcement from J. Maenhaut, president of the International Dairy Federation, permanent office of which is located in Brussels, Belgium. Mr. Maenhaut writes:

"As you may have seen, (see minutes of meeting of permanent bureau, International Dairy Federation) the next International Dairy Congress is to be held the month of June next year in Paris. We hope that by that date, or even much before that, the fusion of all the national dairy groups into the International Dairy Federation, will be an accomplished fact and that the Paris congress will be able to celebrate close and cordial relations with all the dairymen of the world.

"We should like to believe that we may count on your entire co-operation in the Paris congress."

It is suggested that every American business man, scientist or educator who may have any hope of attending the International Dairy Congress in Paris in June, 1925, send his name to Mr. Van Norman, 910 S. Michigan Avenue, Chicago, and be kept informed as to the progress and plans for the congress and of any American participation which may develop.

U. S. A. Leads.

More nations sent delegates to the World's Dairy Congress in the United States in 1923 than were sent to any other international congress except the Red Cross at Geneva. The Quarterly Bulletin of the League of Nations has just issued gives a brief report of seventy-nine international congresses held in fifty odd countries during the year 1923. It lists forty nations as participating in the dairy congress. The final registration figures are forty-four nations.

* * *

The executive committee of the National Dairy Association at a recent meeting revised the classification for state herds at the National Dairy Exposition to include eight animals instead of ten as heretofore. The animals now required to make up a herd are as follows: One bull, two years old or over; one bull, under two years old; one yearling heifer; three cows, three years old or over; one heifer, two years old and under three, and one heifer calf.

Another change is that three animals may now be entered by one exhibitor instead of only two as heretofore. The class still requires five entries in the ring in order to fill it.

The judging days for cattle at the exposition have been arranged as follows:

Tuesday, September 30—Guernseys.

Wednesday, October 1—Holsteins.

Thursday, October 2—Jerseys.

Friday, October 3—Ayrshires and Brown Swiss.

The College Students' Contest in Judging Dairy Cattle will be held on Saturday, September 27, the opening day of the exposition. On Monday, the 29th, the College Students' Contest in Judging Dairy Products and the Boys' and Girls' Cattle Judging Contest will be held.

Technical Cleanliness

An Address Before the Sales Convention of the Breyer
Ice Cream Co., Philadelphia, Pa.,

By L. A. WILLIAMS

THERE isn't a man, woman or child who comes into your store but looks at the knife or the fork or the spoon or the ice cream dish or whatever thing in which your commodity is contained. It is looked at critically. I know nothing about ice cream, but I say when we come to an exhibition of this kind, our eyes and ears are wide open and we go around and look at all the equipment and after all is said and done, with all its equipment, and the firm or factory back of your success or mine, the essential thing is to produce a clean vehicle, or a clean vessel in which the product is to be served.

Folks are most discriminating these days. It is marvelous to see how men, women and children today are being trained in cleanliness. There is absolutely no excuse for anything else today. The other day, it was my privilege to go into one of Philadelphia's largest restaurants. I went in there and was overcome by the blackness of a paper napkin. That thing alone was no objection. It had to be overcome and was done very quickly. If you are inclined to be a little off in that respect and you have not quite caught that vision that clean linen is a most excellent thing—I won't say cleanliness is next to Godliness—some of us are too far from Godliness today.

How do we clean things? How do I get these things clean? People are inclined to soap. We all run for soap to clean the silverware, to clean the glassware and

all kinds of things, and it has been absolutely proven in the laboratories that soap is a detriment in the cleaning of a vessel that has fatty substance in it. If you are working every hour of the day as an ice cream man, you have got to have something that cuts away the fatty substance that gathers.

I WAS out in one of Philadelphia's big dairies the other day and I saw twenty girls testing from a bacteriological standpoint, every bottle of a great group. There is nothing that breeds disease so quickly as fatty matter that comes from ice cream. You know the more germs it generates the higher the quality of the product. The physical and economical means of getting to this point is what? What is the proper thing for me to say? Soaps have their place; we can't wash our faces without soap. But we must have a soda for this. A soda gotten up for that purpose. For years and years we have been experimenting on how to cut away this fatty substance and make the dish or vessel absolutely clean and without any taste whatever. The old physical way of getting down with the elbow grease is a thing of the past. What we want today is to put the vessel into something and bring it out nice and clean. We have modified soaps or cleansers. All ice cream dealers should use these. By placing the vessel in a solution of this, you take it out after a little while, put a little hot water on it, and you have it nice and clean. I am not going to mention the names of these cleansers from this platform but you can easily get them. Use soda, the more modified it is the better it will do the work. We have carbonates and bicarbonates; we have folks that are disposing of the material to the consuming ice cream trade for that particular purpose. What we have to do is study and look after this thing.

Now, when you come down to butterfats, or things that accumulated like a can of cream that has stood over, you need to put a little more attention to the cleaning of that vessel. We have a higher alkali that eliminates all that sort of trouble and kills every particle of germ, and without odor, leaving the cans thoroughly clean. There is very little to be said on the method. If it is to be used in a machine, it is a solution. If it is handwork, it comes by using your best judgment; we can't talk percentage here.

I would say to you by all means use no soap. It is

C.E. Rogers,
Detroit, Mich.
Gentlemen:

The thirty-six inch pan which we purchased from you, has been in operation about nine months.

The pan is working perfectly, and has never given us a bit of trouble. We are using it for making ice cream mix, and are enabled to make our mix cheaper and better by this method. We will probably be in the market for a larger pan next year.

Thanking you for the excellent service rendered on this installation, we remain,

Yours very truly,

Franklin Dairy Co.

hard to rinse soap out of vessels. Where you have vessels to cleanse, the best thing to use in the process of dissolving these fats is a soda.

Now the next thing is the point that these soaps that I speak of are non-sudsy. There are no suds. Whatever is washed comes out ready to be left to dry and then, after it is left to dry, it will have a lustrous, bright, glossy finish.

YOU and I know we can build up our business by being cleaner. Take the tables in the store. I have been in places selling ice cream where I have seen the marks of the previous customer on the table when I sat down. There was a line on the table around the service for the previous customer. That is bad. In these days of discrimination it will not pass. I have heard a man say recently that we have arrived at the time when in college if the professor should take a book and say to the student, "There it is," and point with his finger and his finger nail was not clean, the student would be watching the finger with the finger nail that was not clean, instead of what was pointed to by the professor. It is most withstanding; this discrimination. If the student is that discriminating in the matter of cleanliness in the class room, I wonder what he will think of you if he sees the ring around the table of somebody else's serving; the marks of the previous customer on your table; the visible evidence that somebody was there before you having a plate of ice cream.

This is a very important thing. What are we going to do about it?

THIS Tall Tub

has been the first choice of discriminating ice cream manufacturers ever since it was introduced. They will buy no other, for this tub is backed by a three year guarantee. Let us tell you more about it.

ZIEGLER EMPLOYEES INSURED.

Through an arrangement with the Metropolitan Life Insurance Co. the fifty-three employees of the Ziegler Milk Company of Reading have received life insurance protection of \$1,000 each and an additional insurance which assures them of benefits of \$10 weekly in the event of illness or accident.

This policy, arranged by Willard E. Ziegler, one of the owners of the milk company, is of contributory group type, the workers sharing the payment of the premiums with their employers. The total insurance involved is \$57,500 on the group life policy and approximately \$575 a week on the health and accident protection.

A nursing service maintained by the Metropolitan Life will be available to any of the insured Ziegler workers, in the event of illness, and experts of the Metropolitan are constantly compiling pamphlets dealing with health conservation and kindred subjects for distribution to policyholders.

An additional feature of the Metropolitan's group insurance is its Policyholders' Service Bureau. This is composed of well equipped technicians who are prepared to consult with the executives of insured companies should the latter seek assistance in the solution of problems on business administration.

DID YOU EVER STOP TO THINK

By E. R. Waite, Secretary, Shawnee, Okla., Board of Commerce.

That every business has something to sell. Some have merchandise. Others have service.

That people are willing to pay a fair price for good goods or service. They will not pay out money for poor goods or service, if they can help it.

That people buy those things they have confidence in. The business concerns who take the public into their confidence by truthful advertising get their confidence—likewise their business.

That the sooner non-advertisers take a friendly interest in the public by truthful advertising, the sooner the public will take a friendly interest in their business or service.

That business concerns who advertise give service.

That service is one of the chief essentials of any business. Every business should be a service institution for the territory it serves.

That the more ways in which a business can render service, the more will that business prosper.

Advertising is an important service due the public. It always pays to give them the service they expect.

ADVERTISING OF DAIRY PRODUCTS AND SERVICE IS INDISPENSABLE TO GOOD BUSINESS.

NEW ALABAMA PLANT.

The Dothan Ice Cream Company, Dothan, Ala., has just moved into its new plant and recently began operations. The plant is equipped with Cherry equipment, and has a daily capacity of 800 gallons of ice cream and 2,000 pounds of butter. J. W. Parkman is manager of the manufacturers of "Supreme Ice Cream, The Perfect Food."

NEW PLANT FOR JACKSONVILLE FIRM.

The Berrier Ice Cream Co., Jacksonville, Fla., has completed plans for the erection of a new home on Eagle St., between Julia and Hogan Sts. H. F. McAden is the contractor. The company's new factory will be a two-story brick and tile structure with a fifty-foot frontage and a depth of fifty-four feet. At the rear of the building will be a one-story shed, housing the loading platform. It is estimated that the construction cost will amount to approximately \$15,000, and about \$6,000 worth of new machinery will be added to its present equipment, according to J. R. Berrier, president. Total investment in the new factory will be about \$70,000, it is said.

OHIO ICE CREAM NOTES.

By C. J. Yuncker.

Stubenville Pure Milk Co., Stubenville, has added a new hardening room, size 18 x 18 feet, also 10-ton ice machine and a package filling machine also another model 50-qt. ice cream freezer and fourteen 8-hole refrigerating ice cream cabinets. They are doing a large business.

W. D. Axtel, Jr., formerly with Esmund Dairy Co., Sandusky, purchased the ice cream plant out of the forced sale of Electro-Pure Plant at Mansfield, and now is operating it himself, being sole owner and is doing business under the name of Dairy Products Store. He says he is doing fine so far.

Ira Evans, ice cream foreman of White Mountain Dairy Co., Lima, was severely scolded on both arms with a bursting steam pipe. He is resting easier at this writing.

Bradner Dairy Co., Bradner, has installed a new 65-h. p. oil burner. Also a 10-ton ice tank, an ice cream freezer, a new truck, and an 8-ton compressor.

Isaly Dairy Co., Youngstown, has opened up another retail store with two-ton York machine at New Castle, Pa. They also purchased seven 8-hole ice cream cabinets and eight 8-hole iceless cabinets.

Crystal Ice Cream & Bottling Company, East Liverpool, has added a new truck.

Isaly Dairy Co., Marion, has opened up a retail store and cream station with a 2-ton refrigeration at Upper Sandusky. They also are enlarging their retail store at Kenton, with a large refrigerating machine.

Hughes Dairy Company, Bowling Green, has just installed two 250-gallon capacity centrifugal water pumps, also one of 300-gallon's capacity and one of 250-gallon's capacity for brine, all equipped with electric motors; a 60-ton compressor and a 150,000-gallon cooling water truck of cement. The company is spending \$15,000 in new improvements.

V. T. Front is the new manager of Purity Ice Cream Company at Springfield. He takes the position of W. K. Wiemer, who no longer is with this firm.

Findlay Dairy Company, Findlay, has the first story up of their new building. It is of all dark red brick and cement. They will have a nice building when it is completed.

B. M. Harrison, Kenton, has a nice cement building and a clean ice cream plant. He has built himself a cottage at Russells Point where he and his family can spend the summer vacation.

R. L. Graham of Graham Ice Cream Company, Lima, was "laid up" with sickness early in June.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Only after 753 separate inspections and tests is the Nizer Cabinet permitted to pass

Retail Sales Increased by Nizer Cabinets

SINCE the introduction of the Nizer, three years ago, attention has been focused on two main advantages—(1) reduction in distribution cost; (2) reduced shrinkage losses.

That either of these advantages alone is more than enough to justify the purchase of Nizers has been thoroughly proven by Nizer users.

Now, however, a third big advantage is claiming attention. Figures coming in both from ice cream manufacturers and retailers indicate that Nizers are building up retail gallonage to a remarkable extent.

A typical retailer (1200 gallons a year) reported a 20% increase in volume this year as compared with the corresponding period last year, and attributes

it entirely to his 6-hole Nizer Cabinet.

The accompanying reports from retailers and manufacturers show that, despite the unfavorable weather this year, increases up to 100% are expected by the trade.

The extra profits from this source, plus the savings in distribution and shrinkage, make Nizer Cabinets pay for themselves in from one to three years.

Such a remarkable condition is almost unprecedented in the history of dairy machinery.

In view of this, it is difficult to understand how any ice cream manufacturer can long afford to continue the use of ice and salt cabinets.

The weather has been so cool in this section for the last month that it is impossible to get a real comparison with last year. However, we know that in small cities where we have only one customer and where we have installed a Nizer for those customers, they have noticed a very decided improvement in their business.

Respectfully,
HEY BROTHERS,
Sterling, Ill.

All of the dealers handling the Nizer report a decided increase and, whether basing their belief on facts or theories declare they expect a fifty per cent increase in their business during the summer.

Cordially,
THE UNION ICE CREAM CO.
Nashville, Tenn.

The Nizer Iceless Cabinet attracts the attention of everyone who comes in, and after showing the sanitary way in which our ice cream is kept, I am sure we will double our ice cream business this year.

Very truly yours,
HILLSBORO PHARMACY,
Nashville, Tenn.

Since we installed your Iceless Cabinet we have never had one single complaint because of soft cream. And, needless to say, we have had the confidence necessary to go ahead and build up a brick business.

Yours sincerely,
KIMLING & SHEHAN,
Jackson, Michigan

Dear Sir:—In the past we have been making up our ice cream mixes on a gallonage basis, since sending for your little book on ice cream mix, we are endeavoring to adopt the pound system, and as this is a new way of figuring the mix for us we want to be sure we are right before adopting it.

We have figured out a 100 pound mix which we inclose and would like to have you go over this and see if we are right in it also if you consider it a well balanced mix, we inclose a stamped envelope for reply.

Ingredients	Fat	Serum Sol.	Total Sol.
10.0 lbs. cane sugar	9.70
4.0 lbs. cerelose	1.90
.5 lb. gelatine47
2.0 lbs. milk powder	1.90	1.90
8.0 lbs. evaporated milk.....	.64	2.76	3.40
24.0 lbs. 32% cream.....	7.68	1.40	9.08
51.5 lbs. 4% milk.....	2.06	4.45	6.51
	10.38	10.51	32.96

12.5% sugar.

In regard to the evaporated milk will advise that this is 8 per cent fat and total solids 26 per cent.

Reply: I notice that you have a few errors in making your calculations especially the calculation on evaporated milk. Your evaporated milk containing 8 per cent fat and 26 per cent total solids would furnish .64 of a pound of fat, but would only furnish 1.44 of serum solids. This does not make any very material difference in your formula, except that it reduces the serum solids to 9 per cent.

I am suggesting another formula in table two which contains 3 pounds of skim powder instead of 2 pounds. and which will keep your serum solids about 10 per cent and also raise the total solids.

Ingredients	Fat	Serum Sol.	Total Sol.
10.0 lbs. cane sugar	9.50
4.0 lbs. cerelose	3.80
.5 lbs. gelatine47
2.0 lbs. skim powder	1.90	1.90
8.0 lbs. evaporated milk.....	.64	1.44	2.08
24.0 lbs. 32% cream	7.68	1.45	9.13
51.5 lbs. 4% milk.....	2.06	4.40	6.46
100.0 lb. mix.	10.38	9.19	33.34

Table 2.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	13.30
.5 lbs. gelatine47
3.0 lbs. skim powder.....	2.85	2.85
8.0 lbs. evaporated milk....	.64	1.44	2.08
24.0 lbs. 32% cream.....	7.68	1.45	9.13
50.5 lbs. 4% milk	2.02	4.32	6.34
100.0 lbs. mix.	10.34	10.06	34.37
Per cent sugar.....	14.00

You will also notice that in table two, I am suggesting 14 pounds of sugar rather than using sugar and cerelose. I can hardly see what your object would be in using cerelose especially when cane sugar will produce much better results unless you have some of this material on hand. I also think you do not understand the solids in cerelose sugar as you appear to figure the solids 1.9 per cent in 4 pounds. It is possible that you are confusing the word cerelose with glucose and that the 4 pounds you used was corn syrup instead of corn sugar.

* * *

Dear Sir:—I am making a mix as follows and am turning out a good ice cream, getting 100 per cent overrun. Would like to improve if possible. Is there anything that you would suggest adding to or taking away from the following?

275 pounds 20 per cent cream.
117 pounds skim milk.
68 pounds sugar.
15 pounds marshmellow.
10 pounds skim milk powder.
12½ pounds water.
2½ pounds gelatine.

500 pounds—11 per cent butterfat.

The mix is pasteurized at 145 degrees for 30 minutes and run through the viscolizer at 2500 pounds and cooled down to 40. Natural aging 48 to 60 hours. The 12½ pounds of water is used to melt the gelatine before adding to the mix. Would egg powder improve the ice cream, if so how much should I use?

Reply: You asked me to calculate your ice cream

There is only *one satisfactory method* of making

Butter Scotch Ice Cream

and that is by using

SCOTCH BOB

THIS new delightful flavor, originated by us, is fast spreading from one section of the country to another. Why not be the first to introduce Butter Scotch Ice Cream to your locality? The "pickings" go to the pioneers.

Easily made with SCOTCH BOB which is not an extract, but REAL BUTTERSCOTCH made especially for use in Ice Cream. It is economical, replacing three quarts of mix in every 40 quart freezer. A trial keg at \$10.00 is a good investment for any manufacturer looking for more business. Send for yours.

KAY-WHITE PRODUCTS, INC.

"A Good House to Deal With"

CONNOR'S Delicious TUTTI-FRUTTI

It really is not at all surprising that "Specials" made with CONNOR'S Tutti-Frutti make such a hit with the vast throng of buyers who prefer good Tutti-Frutti to any other ice cream.

For the discriminating buyer immediately detects the supreme quality obtained through the use of finest ingredients blended according to CONNOR'S exclusive recipe.

CONNOR'S Tutti-Frutti—prepared by experts in ice cream making—is composed of finest quality Pineapple, Peaches, Red and Green Cherries, English Walnuts and raisins. Despite this fact it is moderately priced. In ten gallon kegs the price is \$2.45 per gal. Send for a sample keg today. Use a gallon on a trial batch. If you are not enthusiastic over the results we will be glad to take the balance off your hands.

Special Note

Write for prices on the complete CONNOR line of quality fruits.

QUALITY

FRUITS

mix in order to see whether you had it properly balanced. You will find these calculations given below in table one where you will notice that your ice cream will test 11 per cent butterfat and about 8 per cent serum solids, having a total solids of about 32.5 per cent.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
275.0 lbs. 20% cream.....	55.0	19.58	74.58
117.0 lbs. skim milk.....	10.42	10.42
68.0 lbs. sugar.....	64.60
15.0 lbs. marshmallow.....	1.50
10.0 lbs. skim powder.....	9.50	9.50
12.5 lbs. water.....
2.5 lbs. gelatine.....	2.37
500.00 lbs. mix.....	55.00	39.50	162.97
Per cent.....	11.00	7.9	32.59

You could improve this mix by adding a little more skim milk powder to increase the serum solids to about 9 per cent which would also increase the serum solids. You could easily do this by using 7 pounds more skim milk powder and you would in that case use 7 pounds less skim milk to maintain your total of 500 pounds. I believe if you will do this you will find that your product will have a little more body.

* * *

Dear Sir:—Mix containing: sugar 13.4 per cent; gelatine .5 per cent; skim powder 3.85 per cent; cream 17 per cent, 82.25 per cent; total 100.00 per cent.

We are thinking somewhat of substituting skim condensed for skim powder. What changes will occur in our figures? We are quite anxious to maintain our quality, so are asking you to make a table which will give same results as above.

Reply: You will find below in table one calculations showing the percentage ingredients of your present mix. In table two I am suggesting the use of skim condensed milk in place of skim milk powder for solids.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
13.4 lbs. sugar.....	12.73
.5 lbs. gelatine.....47
3.85 lbs. skim powder.....	3.65	3.65
82.5 lbs. 17% cream.....	14.02	6.09	20.09
100.25 lbs. mix.....	14.02	9.74	36.94

Table 2.

Ingredients	Fat	Serum Sol.	Total Sol.
13.4 lbs. sugar.....	12.73
.5 lbs. gelatine.....47
16.0 lbs. 27% skim cond.....	4.32	4.32
70.1 lbs. 20% cream.....	14.02	4.99	19.01
100.0 lbs. mix.....	14.02	9.31	36.53

You will note that in table two it would require 70 pounds of 20 per cent cream to get the 14 per cent butterfat in the ice cream.

* * *

Dear Sir:—Would like to have table to make 100 gallon batch of mix composed of following ingredients: 16 per cent b. f. sweet cream; 3½ per cent b. f. milk; skim milk, stock powdered form; gelatine; sugar—We wish our ice cream to contain 16 per cent butterfat and 30 per cent total solids.

Kindly tell me how many pounds of each ingredients to make a batch of 100 gallons. We are equipped with large pasteurizers and homogenizers. What process will I have to put same through to make A1 ice cream?

Table two using sweet butter 16 per cent moisture; sweet milk 3½ butterfat; sugar, skim milk powder, gelatine.

Reply: If I understand your letter correctly you want your ice cream to test 16 per cent butterfat and 30 per cent total solids and also that you wanted to use as ingredients in this first formula 16 per cent sweet

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

The PURITY Pasteurizer and Ice Cream Mixer is furnished with either belt or motor drive, as desired.

The Purity Ice Cream Mixer

HAS a powerful double motion agitator of the famous propeller type, which provides the maximum of thorough but gentle agitation.

This produces a *smooth, perfect ice cream mix.*

A *special current deflector* throws the mixture constantly toward the center, where the propellers suck it down in little whirlpools. This makes the PURITY mixer particularly successful for emulsifying powdered milk.

The PURITY is also very useful for pasteurizing and holding cream or small special amounts of milk.

It is entirely lined with tinned copper which prevents rust.

This up-to-date piece of PURITY equipment will *improve your ice cream and increase your profits.*

cream and 35 per cent milk. It is impossible to make up a formula according to these suggestions. I am indicating below in table one a 900 pound mix which is approximately a hundred gallons. You will notice, however, that while this mix tests about 16 per cent fat, the total solids would run 37.5 per cent and it would require 19 per cent cream to make such a mix.

Table 1—900 lb. Mix.

Ingredients	Fat	Serum Sol.	Total Sol.
126.0 lbs. sugar			119.70
4.5 lbs. gelatine			4.27
18.0 lbs. skim powder.....		17.1	17.10
751.5 lbs. 19% cream.....	142.78	54.2	196.98
900.0 lbs. mix.	142.78	71.3	338.05
Per cent	15.8	7.9	37.5

Then again I am indicating in table two a mix according to your suggestion using sweet butter and sweet

milk. You will also notice in table two that it would not be necessary to use any skim powder if you use 16 per cent fat as your total solids in this case would be 35.7 per cent.

Table 2—900 lb. Mix.

Ingredients	Fat	Serum Sol.	Total Sol.
126.0 lbs. sugar			119.70
4.5 lbs. gelatine			4.27
146.0 lbs. 84% butter.....	122.6		122.60
623.5 lbs. 3.5% milk.....	21.84	53.50	75.34
900.0 lbs. mix.	144.44	53.50	321.91
Per cent	16.0	5.9	35.70

* * *

Dear Sir:—Can you give us formula for an ice cream mix having 9 per cent butterfat; 36 per cent total solids; 13 per cent sugar, and .5 per cent gelatine? Milk testing 4.5 per cent costs us 24 cents a gallon. Condensed costs 90 cents a gallon, and cream costs 36 cents a pint. We are using pure vanilla, and also viscolizing during preparation of mix. We are using a 40 quart Ft. Atkinson motor driven freezer.

Reply: You want me to suggest a formula for you using a 9 per cent with 13 per cent sugar and 36 per cent total solids. I would not like to do this as it would require practically 14 per cent serum solids to make the total 36. This would result in sandy ice cream for you. I am indicating below in table one how you might make up a mix testing 9 per cent butterfat and about 12 per cent serum solids.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
13.0 lbs. sugar			12.35
.5 lbs. gelatine47
30.0 lbs. 27% plain cond....		8.10	8.10
56.5 lbs. milk and cream.....	9.0	4.27	13.27
100.0 lbs. mix.	9.0	12.37	34.19

* * *

You did not give me the test of your sweet cream so I was not able to figure the amount of cream necessary, but have indicated the amount of milk and cream together to furnish the 9 pounds of fat.

* * *

Dear Sir:—Our difficulty is in getting the overrun. What improvements would you suggest? The mix follows: milk 80 pounds; sweet skim condensed 20 pounds; butter 16 pounds; sugar 10 pounds; milk powder 2 pounds; gelatine 12 ounces.

Reply: I am glad to show you the calculations on your ice cream mix. You will notice that the per cent of fat appears to be 13 and the serum solids 11 and the total solids 38. You have a mix which is very high in solids and I believe your trouble in getting the overrun is due to this fact.

Nonpareil Cork Covering in the plant of the Detroit Refrigerating Co., Detroit, Mich.

For the Hardest Service in the Plant

MOISTURE doesn't affect steam-pipe insulation; the heat drives it off. But moisture condenses on cold lines, and if it gets into the insulation, it freezes and expands, and soon disrupts the covering. Inspect almost any absorbent covering that has been on low-temperature lines for more than a few months. You will probably find it cracked and bulged, dripping wet, or solid with frost. That may be "covering" but it isn't *insulation*. It may be cheap to buy, but it certainly is not cheap to use.

Cold pipe insulation gets the hardest service in the plant, but Nonpareil Covering is made to stand it. First of all, Nonpareil Cork Covering is nonabsorbent in itself. In addition, it is moistureproofed inside and out with an impervious coating of mineral rubber. Apply it properly—which means adequate thickness, with Nonpareil Fitting Covers on *all* fittings, joints sealed tightly, pipe hangers outside—and Nonpareil Cork Covering is not only the most efficient, but the most durable and economical insulation made for brine and ammonia lines. In the hardest service in the plant Nonpareil Cork Covering actually "Lasts Longer than the Pipe."

*Samples, full information

Nonpareil Cork Covering

For Cold Lines, Coolers and Tanks

IF YOU KEEP UP WITH OUR ADVERTISERS, YOU KEEP UP WITH PROGRESS.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
10.00 lbs. sugar	9.5
.75 lbs. gelatine71
20.00 lbs. 27-40% sweet cond.	5.4	13.40
2.00 lbs. skim powder.....	1.9	1.90
16.00 lbs. 84% butter.....	13.44	13.44
80.00 lbs. 4% milk.....	3.20	6.9	10.10
128.75 lbs. mix.	16.64	14.2	49.05
Per cent	13.0	11.0	38.0
Per cent sugar.....	14.0

I would suggest you try either reducing the sweetened condensed milk to reduce the solids or leave out the skim powder providing you want to continue to have your cream test 13 per cent butterfat.

* * *

Dear Sir:—We would like to make a 120-gallon mixture each time, using a 30 per cent sweet cream and 4 per cent sweet milk, a sweet condensed milk, containing 27 per cent milk solids, 44 per cent sugar solids, and a 29 per cent moisture, containing a 10 per cent butterfat for the mixture, a 14 per cent sugar, and containing total solids of 35 to 36. Also advise best gelatine.

We do not use any butter or milk powders at our plant, using nothing but sweet milk and sweet cream.

Reply: I am glad to suggest a 1000 pound ice cream mix made up according to your suggestions. I am sure that this mix will give you very satisfactory results.

Table 1—1000 Pounds Mix.

Ingredients	Fat	Serum Sol.	Total Sol.
52.0 lbs. sugar.....	49.40
5.0 lbs. gelatine	4.75

KLEEN KUP

MONO SERVICE
COMPANY
NEWARK, NEW JERSEY

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

I shall be glad to assist you further in any way I can in getting your mix properly adjusted.

Dear Sir:—What I am anxious to know is, would we be saving or would we be gaining anything to use skim milk, bought from our farmers in liquid form, in our ice cream mix?

You ask if we use skim milk powder and water. Our answer is that we do not use any water in our mix. What we really want to know is if we would gain anything by using skim milk, or had we better leave things as they are at present.

The sixty-six pounds milk stock that we referred to in the mix was sixty-six pounds skim milk powder. Skim milk powder costs us \$12.55 per hundred pounds. Skim milk we could probably buy for about one cent a pound.

Reply: There is no question but what you would gain both in flavor and quality of ice cream if you used skim milk in your ice cream mix, rather than skim milk powder and water. If you can buy skim milk for one cent a pound, the solids of this milk would cost you about as much as skim milk powder costs, but if you could secure skim milk of good flavor and sweet enough so that it will stand heating, you could, in my judgment, improve the flavor of your product. The solids in this skim milk would have absolutely no tendency to cause sandy ice cream.

If you use skim milk, you would, of course, reduce the amount of skim milk powder comparable with the solids provided by the skim milk.

* * *

Dear sir:—We would appreciate very much if you would figure us a mix of 100 gallons. We are installing a pasteurizer that is 100-gallons' capacity. We want to make a ten per cent cream. We will use 4 per cent milk, eight per cent condensed milk, and twenty per cent cream. Please express it to us in gallons as we are new at the business and we will understand it better.

Reply: I am glad to suggest below in table one, the ice cream mix which you desired to have me figure out for you.

Table 1.—800 pound mix—10% fat—89 gallon mix.

Ingredients	Fat	Serum Sol.	Total Sol.
112.0 lbs. sugar	106.40
4.0 lbs. gelatine	4.70
160.0 lbs. cond. 8%	12.8	43.2	56.00
290.0 lbs. 20% cream.....	58.0	40.68	108.04
234.0 lbs. 4% milk	9.36
800.0 lbs. mix	80.16	83.88	274.14
Per cent	10.02	10.48	34.27
160 pounds cond. is 18 gallons.			
290 pounds 20 per cent cream is 35 gallons.			
234 pounds 4 per cent milk is 27 1/5 gallon.

THE DRY BUTTERMILK CO., Inc.
WASECA, MINN.

An 8,000 pound "Simplex" Double Holding Tanks Regenerative Pasteurizer in N. Y. State shipping station. Pasteurizes 40,000 to 60,000 pounds of milk daily. The newer outfits have three holding tanks.

The installation shown above has operated over six years and handles 600 to 700 40-quart cans daily. It has lately been increased to 12,000 lbs. per hour capacity.

Positive Holding

THE milk is first heated to a pasteurizing temperature by the Simplex double tube heater. It is then subjected ten minutes each, or thirty minutes in all, to a heat treatment in the three holding tanks; then passing over a Simplex continuous surface milk cooler and directly into milk can or bottle filler.

Each holding tank is **double**; and milk must pass **twice the length** before leaving the tank.

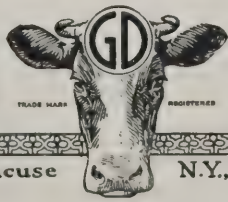

The Simplex patent regenerative heating and cooling water system saves from 50% to 60% of the steam that would be required without it. This means economical operation.

The Simplex Positive Holding Tank Pasteurizer is equally adapted to large and small plants; requires very little floor space; is dependable and fool-proof; and gives the small milk dealer **exactly the same efficiency** as enjoyed by the largest milk plants. We fully recommend them. Write for details and prices.

"The HOUSE with the GOODS and the SERVICE"

Sectional view of holding tank. Equivalent to one single tank of twice the depth, or two plain tanks.

Seattle's Half-Million-Dollar Plant Opened

Doors of Seattle Ice Cream Co. Thrown Open to Public

TWENTY-FIVE years ago, when Seattle's population was 40,000, an ice cream business had its inception. The business was so small that it could be packed into the corner of an ordinary room and not be crowded. When F. V. Fisher began the manufacture of ice cream in such a small way, little did he realize that he would some day head one of the large institutions in Seattle, and that he would be the proud president and general manager of the Seattle Ice Cream Company, with a \$500,000 "Palace of Purity" in which to produce a quality product that would be enjoyed by nearly a million people of Seattle, Wash.

Of course, the first ice cream manufactured was made with the aid of a hand freezer. After making up a small amount in this tiresome method, it was put in a push cart and laboriously delivered. Business was improving nicely, so a small ice cream plant was put into operation on the corner of First Avenue and Railroad Way. Here the output was multiplied through the installation of a barrel freezer.

Steady increase in the demand for good ice cream necessitated larger quarters and the Seattle Ice Cream Co. then took up operation at First Avenue South and Stacy Street. Here the business developed into a substantial institution, until today it is prominent in the industrial development of the Pacific Northwest, established in its new half-million dollar plant, constructed

exclusively for the manufacture of ice cream. The plant is located on Fourth Ave. South and Atlantic Street.

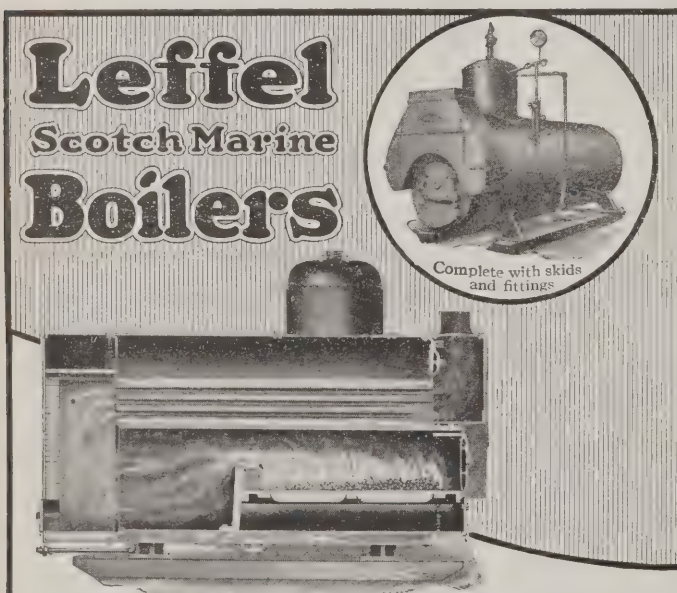

The president, F. V. Fisher, has stressed upon the people of Seattle, in fact, the state of Washington, that ice cream is a recognized food, and is as staple as milk and bread, until the Washingtonians look upon Seattle ice cream just that way, and have come to rely upon the Seattle Ice Cream Co. as the manufacturer of a wholesome, absolutely pure, nourishing, substantial food product.

THE doors of the new plant were thrown open to the public and the people of Seattle were urged to visit the new home of the Seattle Ice Cream Co., and to familiarize themselves with the thoroughness and completeness of every machine and to impress upon them that it was "their surety of purity."

Groups of visitors were shown through the plant by guides who carefully explained the purpose of the various up-to-date machinery. The tour led through a general office where efficiency was reflected by the modern fixtures and office equipment, where cleanliness seemed to be the predominant note. Railroad tracks were built exclusively for the Seattle Ice Cream Co. to expedite delivery of raw materials and equipment and to avoid any unnecessary delay in shipping the finished product. The equivalent of 10,000,000 quarts of milk is received in a year at this plant, and each can of cream is sampled in the modernly equipped, immaculate laboratory room, where scientific testing equipment has been installed and every lot of cream, fresh eggs, cane sugar, fruits, nuts and other ingredients entering into the manufacture of ice cream, is carefully analyzed.

Another assurance of purity in the finished product is pasteurization of the most thorough character. From the pasteurizers and viscolizers, the mix is transferred to the glass-lined aging or ripening tanks through large sanitary pipes. A cold brine, double-wall jacket insulated on the outside with cork provides a cooling chill that is automatically regulated and recorded on a thermostatisgraph dial, thus a faultless uniformity of quality is assured.

AS ANOTHER step in cleanliness, after each drawing off of each mix, every pipe and fitting and gage in the transportation of materials from the cool room

Leffel
Scotch Marine
Boilers

Complete with skids and fittings

QUICK firing and steady steaming ability make Leffel Self-Contained, Internally Fired, Horizontal Return Tubular, Portable Boilers ideal for use in Creameries, Dairies and Ice Cream Factories. Hot gases of combustion travel twice through the full length of the boiler. Every possible heat unit is used to produce steam. This efficient application of heat explains why Leffel Scotch Marine Boilers are replacing less suitable types throughout the milk handling industry. Sizes 6 to 100 H. P. Meet requirements of all State boiler laws.

Plant of United Cork Companies at Lyndhurst, N. J., where the 100% Pure "Crescent" Corkboard is made.

to the freezing process is taken apart and sterilized. The white tile walls, ceiling and terrazzo floors are washed with live steam daily. Nine silver freezers, each of a capacity of 80 quarts every ten minutes, are electrically driven so that either one freezer or the entire battery can be operated as occasion warrants. After the cream is frozen, it falls into money metal hoppers and from there through six-inch silvered tubes to the floor below, where it is packed in scrupulously sterilized cans and stored in the hardening rooms, awaiting delivery.

The manufacture of brick ice cream is given a separate department and three freezers are assigned to brick-making and brick cartons are filled by machinery, so that no human hands touch the product from start to finish.

Even though the temperature in the hardening room is from 10 to 20 degrees below zero, no ice is in view, the air is dry and breath-taking. However, there are more than ten miles of refrigerating pipe in these hardening rooms. According to the officials of the plant, this is the utmost modern equipment in insulation engineering, and this is verified by the information that the walls of all ice storage, cream, fruit and "sharp" rooms have a cork insulation of eight inches in thickness. It is claimed that 14 carloads of cork, imported from Spain at a cost in excess of \$20,000, were required to make these rooms impervious to outside temperature.

The company also has a "fancy ice cream department" and they expect to make this one of the show places of the plant later on, because of the completeness and novelty of its equipment.

Twenty-four automobile trucks are used by the Seattle Ice Cream Co. in delivering its product to hundreds of dealers in Seattle and surrounding towns.

INDIANA PLANT PURCHASED.

The Guernsey Milk Co., Lebanon, Ind., a co-operative company was purchased by J. A. Fowler and Chas. H. Thompson, both experienced dairy men, early in December, 1923. New equipment for the milk and ice cream departments was purchased and, upon taking possession, the firm name was changed to the Guernsey Milk and Ice Cream Co. Emmert Thompson is also connected with the firm at this time.

A 10-ton refrigeration system was installed and a hardening room with capacity of 1,000 gallons of ice cream and storage for 600 gallons of milk was built by the Armstrong Cork & Insulation Co. A 40-quart Fort Atkinson freezer; starter can, homogenizer, a 6,500-gallon separator, tubular cooler and 300-gallon pasteurizer were also installed.

Two "low-down" wagons were purchased and painted in the colors of blue and yellow, which the company has adopted in all their advertising, as in ice cream cartons, road signs, and dealer displays.

A twenty horse-power horizontal boiler has been installed to supply both the milk and ice cream departments. Milk is obtained from Guernsey herds near Lebanon, which is the home of more than one-sixth of Indiana's prize Guernseys, according to officials of this company.

Choking the Bull as It Were.

The stock salesman, after painting a beautiful word picture, said: "Now, Mr. Jones, you know this company hasn't got a dollar's worth of watered stock in it. How much are you going to buy?"

"Young man," he said, "the next stock I buy is going to have four legs, and I will water it myself."

News from the Eastern Front

From The Ice Cream Review's New York Bureau

Visit With New England Manufacturers

DURING a recent visit to Bridgeport, the writer paid his respects to the new plant of the New Haven Dairy Co., which very recently absorbed the plant formerly conducted by Harry Wadham, well established and known as the Wadham Ice Cream Co.

This new plant is strictly modern, well equipped, and is located in a very convenient site to make it easily accessible to the most remote parts of the city and adjoining suburban territory.

They have installed a very complete new line of up-to-the-minute equipment for the manufacture and distribution of ice cream, viz., glass-lined tanks, gravity-conveyor system for handling mix from tanks to freezers, etc., a group of four, one hundred and twenty-quart freezers—in conjunction with the most modern methods of facilitating the handling of the finished product direct into the hardening room without any lost motion.

The sanitary features of the plant have been amply provided for. The entire plant on all sides being well ventilated by the most modern form of ventilation; all walls in interior, where essential, being finished in white enamel tiling; all partitions being half glass, ceiling high, floors concrete, etc.

They have also installed a fleet of other well-known refrigerated trucks and vehicles, which are not only distinctive for their individuality of general type and color,

but also for the spick and span manner in which they are kept at all times.

The general manager of the plant, H. C. Smith, is certainly a past master at showing off the qualifications of their new plant advantageously, proving positively not only that he realizes what the company has done in order to make it possible to cater to the Bridgeport trade in the ice cream industry satisfactorily, but also proves that he appreciates these advantages and means to let the general public know it.

WHILE in Bridgeport the writer visited with Ernest Huber, of the Huber Ice Cream Co. Mr. Huber, as usual, was the soul of courtesy and seems to take great pleasure in displaying and elaborating on some vital changes they have made in their office arrangement, as well as some startling innovations he has devised on some new refrigerated truck bodies, which incidentally they manufacture in their own shops. Being somewhat familiar with that class and character of work, we are forced to admit that the theory seems to be a practical one and ought to be of great practical advantage to manufacturers who are forced to haul large and heavy loads long distances. The Huber plant is certainly, to our mind, in many respects an ideal plant. They have very decided views on what constitutes a practical working ice cream plant, sparing no expense on keeping up-to-date on modern equipment for the manufacture and distribution. They utilize every square foot of space, which is by no means limited, in manufacturing and repairing truck bodies, cabinets, tanks and linings, also auto repairs, etc., and the entire plant is a bee-hive of industry and the Hubers have every reason to be proud of what they have so nobly builded on such firm foundation.

We couldn't afford to get out of town without looking up our old friends, the Reichert Ice Cream Co. Friend Reichert, Sr., one of the oldest and best qualified ice cream manufacturers in this section, has very decided views on what should constitute an ice cream plant, and has consistently refused to allow himself to be influenced by modernists, yours truly included, toward building and equipping a modern plant.

We also visited the New Haven Dairy, where we were very cordially received by George Platt, and spent a

Letting
well enough
alone

It's a human weakness to avoid changes. The Chinese have not changed their way of doing things in a thousand years. But the Chinese are not the only ones. Today there are business men using ice cream cartons with designs prepared in the "dark ages of advertising." These men are satisfied to let well enough alone. They are "Chinese" business men. We can't help them, but we may be able to help you.

We make Character Cartons—high quality paraffined cartons for ice cream and other products. In addition—we create original carton designs, and revamp and improve existing ones.

Carton design is important, so important that you should overlook no chance of improving your design. Why not send us your carton? Without obligation or expense on your part we may be able to suggest a slight but profitable change in design; or to show how your present carton design can be gradually changed into a new and more sales compelling one. Sutherland Paper Co., Kalamazoo, Michigan.

Character Cartons
for ICE CREAM

CHARACTER CARTONS are above the average in quality—durable and good-looking, with a heavy wax-enamel finish—and yet are not higher priced. You can convince yourself of this by sending us your present ice cream carton, asking for estimate in any quantity from 5,000 up. With our reply will come samples of our work, including some strikingly good-looking stock-designed cartons which may be of interest to you.

Sutherland Paper Co.
Kalamazoo, Mich.

Makers of Character Cartons for ice cream, butter, bacon, sausage, lard, oleomargarine and cheese.

very pleasant forenoon talking over various features of importance to the ice cream industry, viz., mechanical refrigerated cabinets, cone week, etc.

OUR next visit was to the Worden plant at Waterbury. We found they were already installed in their new offices which are certainly a great improvement over the old ones. Had a very pleasant visit with Al. Worden and Mr. Libolt, and found that in conjunction with the many improvements they have been making recently for the benefit of their delivery department, as well as for their new offices, they plan in the very near future making some radical changes in the plant, which will place them, as regards efficiency, on a parallel with any first class ice cream and milk plant in this state.

Our trip then carried us through Hartford, calling on Mr. Judd, of the Hartford Ice Cream Co., and then to Springfield, where we had a pleasant visit (short, but sweet) with our old friend Harry Tait of Tait Bros. He is always the same old congenial Harry; no matter how rushed he is with business or how rough he treats you, he does it with a smile. That smile is almost as effectual, so far as results go, as Geo. Platt's democracy, and the results are always the same—like Oliver Twist, you want more.

Stopped off at Worcester and visited our old friends, Kalashine Brothers' Ice Cream Co. and Shushone Ice

Cream Co., receiving a very cordial reception at each establishment and finally found myself at Providence, where I met several of the manufacturers. Spent a very enjoyable period with Sam Dolbey of the Dolbey Ice Cream Co., another one of the old school. I can't quite define Sam's leading characteristic. He has the cordiality and democracy of George Platt and the smile of Harry Tait, but he also has some other quality. (I can't find the definition of it in the encyclopedia) which causes you to wonder whether you want to go any further or not. Also had a very pleasant visit with our old friend, B. B. ("Coffee") Scott. This is "Coffee's" home-town and he certainly knows something about coffee. Likewise interviewed our friends, Abelson, also of coffee fame, and Hogan of the Iceberg Cabinet Co. Take it all in all, there is a raft of good, wholesome ice cream men, and their allied associates in Providence.

THE next and last stop was at Boston, where I visited Mr. Sutton of the Mansion House Ice Cream Co., who also is a prince of a fellow. His is one of the model plants of the state and as such has been extolled so frequently it doesn't need repetition. He himself is the spirit of optimism and our visit, while devoted entirely to business, was certainly a treat in itself. Mr. Sutton waxed very enthusiastic over the cone-week proposition and also over the slogan contest, seeming to feel that both movements were good advertising mediums for the industry in general.

Also called on the Bushway Ice Cream Co., Neopolitan Ice Cream Co., Hood Creamery, etc. Spent a day calling on our jobbing connections, also paid quite a visit to Prof. Lockwood, secretary of the New England association.

The consensus of this trip, which consumed about ten days, resolves itself down to a few hard, concrete facts, viz., that the New England ice cream manufacturers are all very optimistic as usual; that they have had a very hard season so far, practically no warm weather, lots of rain; that they are all more or less at sea regarding mechanical refrigerated cabinets; that they are almost universally sold on the merit of our journal and that, as the representative of The Ice Cream Review, I shall certainly look forward to my next trip in that territory with a great deal of pleasure.

Greatest Ice Cream Plant in The British Empire

The New Plant of Peters' American Delicacy Co., Ltd., George Street, Redfern, Sydney, Ranks
as One of the Finest and Most Completely Equipped Ice Cream Plants in the World

THE new plant of Peters' American Delicacy Co., Ltd., was opened for business on November 1, 1923, and is a credit to its founder, F. A. Peters, under whose management it has been continually since its beginning, seventeen years ago.

The first factory site was in Little Comber Street, Paddington, Sydney, and occupied a floor space of 1,000 square feet. At the beginning the employees numbered two and the freezing equipment consisted of two 40-qt. North Bros. salt and ice freezers with one-horse wagon for delivery.

After four years the business was moved to a new factory on the ground now occupied. The freezing equipment then consisted of four 40-quart C. & B. brine freezers, one 26-ton Hercules ice machine and the usual equipment in vogue at that time.

Even the most optimistic of Mr. Peters' admirers considered that he had built a plant that would never run to its maximum capacity.

In the years that followed ice cream came to be judged by the high standard that Mr. Peters had set for it in the beginning of his career as a successful manufacturer of this food product.

In 1920 four 40-quart brine freezers were added to the equipment, also two 1,000-gallon pasteurizers and holding tanks combined and another 26-ton ice machine. In a short time these were found inadequate to supply the ever increasing demand for ice cream.

With the great business foresight that has character-

ized all his transactions Mr. Peters, as managing director of the company, had been acquiring property in the immediate neighborhood of the factory upon which to build a large modern factory which he knew would soon be required to take care of a business that was growing at the rate of 150,000 Imperial gallon increase per year.

In 1920 the floor space of the factory occupied 30,000 square feet. The combined new buildings of the company and those under construction, would cover a fair sized city block, four stories high, with a total floor space of over 200,000 square feet.

The new building is re-inforced concrete and all interior walls are finished in white enamel, which are kept spotlessly clean. The plant is always open for inspection and is one of the show places of Australia.

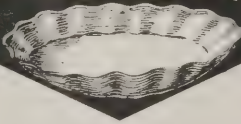

PETERS' American Delicacy Co., Ltd., is as near to a self-contained factory as it is possible to build. Beginning with the farm products that enter into the manufacture of ice cream, the milk and cream is collected from the farms by motors that belong to the company and taken direct to the company's creameries where it is pasteurized and cooled at once, and placed in the company's railway cars for despatch by passenger train to the factory where it is dumped, weighed, and pumped to the fourth story into four 1,500-gallon glass-lined tanks, where it is immediately cooled. The building is so arranged that everything entering into the composition of the mix starts from the top floor and is conveyed by gravity to the floors below, until it finally reaches the shipping platform.

On the third floor are located the two 1,000-gallon glass-lined pasteurizers in which the entire mix is pasteurized and run through an 800-gallon viscolizer and over a water and brine bar cooler where the temperature is reduced to 36 degrees F. and then to four 1,500-gallon glass-lined tanks where it is held for 24 hours. From here it flows through sanitary pipes to the freezing room on the ground floor. The freezing room equipment consists of eight 100-quart brine freezers of the latest type, a brick packaging machine, an overrun tester and a bricker.

There are five hardening rooms of a total capacity of 50,000 gallons which are kept at a temperature of 10 below zero. The maximum daily capacity of the plant is 15,000 Imperial gallons of ice cream.

The manufacturing end of the business is in the

How do you check? your temperatures?

Do you know from day to day at just what temperatures your products have been handled?

And do you have a man spend his time making note of the various temperatures at intervals?

BRISTOL'S Recording Thermometers

give you a continuous accurate written record of what is going on inside every minute of the day. They do this without consuming a man's time, and if your product goes wrong you can trace the trouble to the source thru the temperatures recorded on the Bristol Chart.

Let us tell you some novel ways of checking temperatures with Bristol Recording Thermometers.

THE BRISTOL COMPANY Waterbury, Conn.

BRANCH OFFICES:
Boston New York Philadelphia Pittsburgh
Detroit Chicago St. Louis San Francisco

TRADE MARK
BRISTOL'S
REG. U. S. PAT. OFFICE

hands of S. J. Rawley who for seven years was associated with the New Orleans Ice Cream Company as production manager.

The laboratory is situated on the top floor and is equipped with the latest Mojonnier tester with thermostatic control, and all the necessary appliances for carrying out bacteria research work, and is one of the most completely equipped dairy laboratory in existence. It is under the management of J. J. Kinross, a graduate chemist of Hawkesbury College and who is recognized as one of the foremost dairy experts of Australia.

All the refrigerating equipment is located in the basement. It consists of two 80-ton York motor driven machines, one 40-ton York steam driven machine and 120-ton motor driven machine, which is being installed. These machines furnish refrigeration for freezing and hardening the ice cream and when complete will make 150 tons of ice per day. Three ice storage rooms with a capacity of 1,600 tons are filled during the winter and held as reserve stock.

A FLEET of 51 trucks of capacities ranging from two to five tons and equipped with Groethe refrigerator bodies are kept very busy during the summer delivering ice cream to over 3,000 customers.

The company operates a branch at Newcastle and also one at Manly. A separate building, 65x100 feet and four stories high, is used as a carpenters' shop where truck bodies are built. The cabinets and tubs are made and repaired in the same building. All ice cream tins and milk cans are re-tinned once per season. This practice has been adhered to rigidly, and many of the first tins purchased are still in use. All the company's customers are supplied with cones of the highest grade made on the premises.

Employees are supplied with food from completely equipped kitchens and each department has its own dining-room. No charge is made for any food so supplied. Well furnished rest-rooms are at the disposal of the lady employees. Hot and cold showers are provided on each floor.

IN THE building under construction ample space has been provided for a social hall, billiard rooms, library and reading rooms. Mr. Peters' intentions are to develop the social relations between the employees, as long ago he learned that one of the secrets of a successful business was harmony and co-operation between employer and employees.

The employees number 140, many of whom have been with the company for a number of years, and the company has an enviable record of having paid a bonus of not less than 10 per cent yearly on all salaries earned. In other words, the employees receive the same bonus on salaries earned as the investors receive on money invested. Every permanent employee is a shareholder in the company. A special benefit fund, to which they subscribe a small amount weekly, amply provides for their welfare in sickness or adversity.

To grow from such a small beginning to one of the largest and most modern ice cream plants in existence today, in the comparatively short time of seventeen years, is an accomplishment, and F. A. Peters, his staff and large family of employees are very proud of this accomplishment.

The original capital of the company was £2,000, and has been increased from time to time until today it is £250,000 in 250,000 £1 shares of which 200,000 shares are issued. The company since the second year of its existence has paid an average of over 10 per cent per annum cash dividends to its shareholders.

SINCE 1864

Short Course for Dairy Supply Salesmen

Preparations made for Special 10-Day Course, August 18th to September 29th

By Pennsylvania State College

ARRANGEMENTS have been completed by the dairy husbandry division of the Pennsylvania State College, State College, Pa., to give a special short-course from August 18 to 29, inclusive, to dairy supply salesmen. This course is open to the members of The Association of Ice Cream Supply Men and the registration is being handled by that organization. Applications for registration, together with check of \$10 to cover expenses in giving the course, should be sent to Roberts Everett, secretary of The Association of Ice Cream Supply Men, 1328 Broadway, New York City, N. Y.

The Pennsylvania State College creamery, equipped with all up-to-date machinery for handling butter, cheese and ice cream, offers excellent facilities for a course of this kind. During the past year 157,696 pounds of butter, 13,277 pounds of cheese, 32,000 quarts of ice cream and 130,000 quarts of milk were handled in this plant. The equipment consists of the following:

One 20-ton compressor.
Hardening room for ice cream.
Three ice cream freezers.
One homogenizer.
One viscolizer.
One glass-lined mixing vat for ice cream.
One vacuum pan.
Three cream ripeners.
Two churns.
One cultured buttermilk vat.
Cream separators.
Milk clarifier and filter.
One glass-lined milk pasteurizer.
One brine cooler.
One rotary bottler.
One bottle washer.
One can washer.
Cheese vats and other equipment necessary for handling the above products.

Located as it is, in the mountains of central Pennsylvania, the college offers excellent opportunities for an outing. There will be an opportunity to play golf and tennis as well as other forms of recreation.

Accommodations for

room and board have been arranged for, at the University Club, and it is the aim of the college to make this course enjoyable as well as instructive.

The following is a complete program of the subject matter to be given in this course:

Program for the Supply Men's Short Course to be Given at the Pennsylvania State College, August 18 to 29, Inclusive.

MERRELL SOULE COMPANY

QUALITY PRODUCTS

How the Milk is Handled in the Factory

Powdered Cream

Powdered Whole Milk

Powdered Skimmed Milk

Beginning with the employees, every possible precaution is taken to insure the absolute purity of the milk in Merrell-Soule Plants.

Before being employed, each man is subjected to a complete medical examination, which is repeated regularly once a year. Continuing further in our policy of the utmost precaution: at the beginning of each business day, each employee is supplied with a spic and span white uniform which must be turned in at the end of the day for relaundering. Throughout the whole plant, every

pipe through which milk is conducted is heavily porcelain-lined and all pipes are connected with easily removable valves and flanges so that they may be taken down each day and thoroughly washed. Back in place again, live steam is shot through the entire piping system.

ADVERTISEMENT No. 3

These advertisements, outlining the manufacture of our chief product, **POWDERED MILK**, are for the special information of **ICE CREAM MANUFACTURERS**. Are you saving them? If you have missed the first two advertisements, write to us for reprints.

Next month's advertisement will start the story of the actual production of powdered milk. Watch for it.

DID YOU EVER STOP TO THINK

By E. R. Waite, Secretary, Shawnee, Okla., Board of Commerce.

That every great business has been built up through business developed by advertising.

That advertising is the great opportunity for every business. All should make the most of the opportunity. All the world reads the ads and those fortunate business concerns who present their wares to the public through the printed page are the ones who know what it is to have a profitable business.

That satisfaction is a big thing in business. Advertising gives satisfaction to both the buyer and the seller, because it brings profitable returns.

That modern business concerns know that with advertising they can build an individual business anywhere, because it attracts the best class of business.

That business concerns who tie up aggressively with truthful advertising find this advertising the most valuable asset to their business.

THOSE CONCERNS WHO HAVE CONCENTRATED UPON GOOD ADVERTISING HAVE PROVED WITHOUT DOUBT THAT THEY HAVE ON ACCOUNT OF GREATER TURNOVER BEEN ABLE TO GIVE BETTER VALUE WITHOUT SACRIFICE OF PROFIT.

LOCATION SOUGHT IN MICHIGAN.

The Freeman Dairy Co., with headquarters in Flint, Mich., recently secured an option on property in Traverse City, Mich., and the special representative of the company, A. Bolton, was in that city for a number of days looking over the possibilities for erecting a plant and establishing in Traverse City.

The company will handle all dairy products and manufacture ice cream, if it reaches a decision to locate in that city. Mr. Bolton intimated that he was very favorably impressed with the dairy situation in and around Traverse City and that he optioned local property and would return with Mr. Freeman, president of the firm.

The Freeman Dairy Co. now maintains factories in Flint, Saginaw, Bay City, Cheboygan, Petoskey, Cadillac, Mt. Pleasant and Lansing.

CERELOSE

CERELOSE is a pure white refined corn sugar which has been found to be of advantage to ice cream manufacturers for use in conjunction with cane sugar in the proportion of 25 to 50% Cerelose instead of 100% cane sugar, for the following reasons:

- 1.—Cerelose emphasizes the richness of the butter fat with the result that Cerelose develops the natural flavor of ice cream.
- 2.—Cerelose produces a smoother cream.
- 3.—Cerelose is the new solid builder for ice cream because it improves the body and texture. It will not crystallize nor form sandy cream.
- 4.—Ice cream made with Cerelose is more digestible than when made entirely with cane sugar because Cerelose is a dextrose sugar being directly assimilated by the blood, therefore, more ice cream may be consumed, particularly by infants and invalids.
- 5.—Cerelose is approximately 25% cheaper in price than cane sugar.

Cerelose should be used in the same manner as cane sugar, the amount depending upon the type of cream desired. 25 to 50% is recommended.

WHAT BURDEN SHOULD ADVERTISING CARRY?

(Continued from page 8)

pamphlets, booklets, house organs, etc. (Any piece of literature which goes direct to the dealer and stimulates him into great selling activity for your product.)

3. Newspaper publicity—supplemented by trade journals and special publications.

4. Dealer help signs, window displays, street signs, exhibits and fairs, etc.

Under secondary mediums the writer would place the following:

1. Street car advertising.

2. Stunts and novelties of one sort or another.

For a manufacturer who does not spend more than fifty thousand dollars a year for advertising, it would be recommended that he use none of the secondary mediums, but confine his effort entirely to the primary. If the appropriation, however, amounts up to within one hundred thousand dollars a year, it would be logical for the manufacturer to use several of the secondary mediums.

OUTDOOR publicity for a creamery concern, or any food products advertiser, is very valuable. First of all, because it is the quickest and easiest way to build up good will for the concern. And since the food products advertiser never has bargains or sales to advertise, he must select a medium where the greatest amount of prestige-building can be obtained. Since outdoor publicity serves but one purpose—to advertise—and has but one kind of competition and that is more outdoor advertising, it can logically be expected to produce the greatest results, and usually does. Outdoor publicity is especially valuable along the highways and railroads leading in or out of your general distributing territory. Highway bulletins may possibly mar the natural beauty

of the scenery, but they do create prestige and good will for a concern which uses them consistently. Many times an advertiser gets the idea that it is necessary to use a great many outdoor signs to create an impression of bigness. A few well selected boards at strategic points will give you full coverage and you will be surprised at the results obtained from them.

It is needless to say that the copy and design of these boards should be extremely simple and easy to see at a glance. The bright spot or bull's eye in your display should always be at the left and the copy at the right. Your eye always centers on the bright spot and then travels over the copy later. Don't make the mistake of compelling the reading public to jump from right to left to read a line of copy. They will be past your advertisement before they have time to read it, so make it easy for them.

The value of painted wall signs is twofold. They advertise your product—they advertise the dealer. These signs can usually be obtained from your better dealers by painting a privilege sign somewhere on their store, for them.

DIRECT dealer literature may well be called your "Small arms" section of your advertising effort. While the other more massive forms of advertising are doing their work, the direct to the dealer literature works quietly and effectively. But the success of any dealer campaign depends entirely upon keeping everlastingly at it. A spasmodic effort to stimulate your dealer's enthusiasm this month and no effort next month is worse than no effort at all. Like any direct mail literature, its success depends upon its regularity.

Work out a year's campaign of dealer literature and be ready to "spring it on him" at the start of the season. Probably the easiest and most successful way is to get out a monthly letter or bulletin calling attention to your latest advertising material or copy, and then putting in some words about featuring special flavors during certain seasons, etc. Reprints of your latest newspaper campaign—photographs of your latest billboard design, a broadside of your latest window trimming series. It isn't so much what you send out to your dealer as it is to send out something regularly. And always make the dealer do something or send in for something. The pulling power of mailing campaigns always depends upon arousing interest and then whipping that interest into action.

The value of newspaper and trade publication advertising is very hard to check. A department store can advertise a sale on four hundred bed springs for the

Gentlemen: Please send me hot points and cold facts, and the facts and figures which will prove Eskimo Pie a profit-maker both winter and summer.

Name

Address

City

Have we made a mistake in assuming that Eskimo Pies are not a good Summer Seller?

Our wrapper sales in May exceeded those of any month since January first. We have not urged our customers to continue to make Pies during the Summer months. We have assumed, as many of our customers have thought, that sales would fall off in hot weather. We, therefore, confess that sales made by some of our customers have surprised us.

Our volume of sales in Texas, California, New York and New Jersey, increased in May in spite of the fact that about fifty per cent of the manufacturers discontinued making Pies for the Summer.

By closely following the results obtained by these manufacturers who operate this Summer, we will have something definite to recommend to you when another Summer rolls around.

Convert Icing Service Expense Into Ice Cream Profit

The Lipman electric full-automatic Ice Cream Cabinet now makes it possible for ice cream manufacturers to do away with yesterday's "necessary evil"—icing service.

Retail distributors who are provided with this cabinet will make more profit from your ice cream and will sell more of it, because ice cream is kept firm and hard until it is entirely sold. You make an extra profit on increased sales volume—and on the saving of icing service expense—two good reasons why a Lipman Ice Cream Cabinet is a good investment.

Lipman cabinets are made in 4-, 6-, and 8-hole sizes, and are made in both single and double-row units, furnished with or without Lipman full-automatic refrigerating machine. We also manufacture complete fountain refrigeration systems—for fountains, back-bars, and refrigerators.

Write for detailed information and prices.

FULL-AUTOMATIC REFRIGERATING MACHINES

MENTION "THE REVIEW"—IT IDENTIFIES YOU.

next day and can check their advertising after the sale by counting the number of springs sold.

No ice cream manufacturer has ever been able to check increased sales in ice cream just because of an advertisement run in a newspaper. Therefore, your advertising effort in newspapers must be directed to building up prestige and reputation. Reason why copy is always better than mere generalities. If you are proud of the quality, flavor and goodness of your ice cream, don't be afraid to tell the world about it. Check your advertisement after you have written it. Place the signature of your biggest ice cream competitor at the bottom of your copy. If it is good copy for him, it is rotten for you. Make your advertisements so individual and so personal that no one else can steal your thunder.

Insert a series of coupon or "pull" advertisements in the newspapers every few weeks. The best read newspaper one month may not be the next. Have the reader cut out the coupon and send it for something, no matter if you have to send them a letter thanking them. Usually some novelty or booklet is sent in answer to coupons in the newspapers. If most of the returns of coupons come in from suburban districts and you wish to concentrate on city sales, change your newspaper. No use to shoot at something you don't want to hit.

Trade journals and class magazines should be used for institutional or prestige copy exclusively. Most of these publications are read by ice cream dealers and you should direct your appeal to catch the eye of your dealer. And in such advertising it is clever strategy to talk of your dealer as one of you, one of the big family of satisfied folks who have decided on your ice cream because they know that the quality and service is always the best.

"Pulls" or coupons can sometimes be used in such publications to develop new dealers but this method is hard to carry out. New dealers should be covered by the sales force and not depend upon advertising for the "kick."

DEALER help signs are valuable only when on display and the ice cream manufacturer who thinks that just because he delivers advertising signs to his dealers is a guarantee that they will be given a prominent display is fooled. The one and only safe method of placing such signs is to hire a man to do it, and depend upon the salesmen to do their share. No dealer has any particular interest in display signs. He is constantly receiving display material of one sort or another, so he becomes indifferent unless you work with him. A concern spending \$50,000 or less can well afford to hire a window trimmer to decorate dealers' windows and backbars. Such a contact man must be tactful, courteous and a good mixer.

Sometimes a manufacturer makes the fatal mistake of sending out a grouch to represent the company. About the only people the dealer ever sees is the packer, the salesman, a credit man and the advertising man. The dealer likes or dislikes the company just as much as he likes or dislikes these men who represent you.

EXHIBITS and fairs can be made a very important part of your year's advertising, but don't depend upon these mediums to do everything. They should supplement regular advertising and help to build up a better reputation for your ice cream.

Booths at exhibits and fairs should be high class in the extreme. Do not be satisfied with anything less than the best. You would not permit your delivery equipment to be driven around the streets in an unkempt-slovenly condition—then why permit anything less than the best possible exhibit for your ice cream. The public doesn't usually rave over a good looking exhibit but they will certainly talk about a poor looking one. It is human nature to make a bad thing worse. So in your exhibits or fairs, put the best effort possible into them. They will only pay you in that way.

"WHERE should I use Supplementary advertising?" One ice cream manufacturer asked the question. That question must be answered by every manufacturer himself. There is no rule or route to go by. It has been the author's experience, however, that stunt publicity is only beneficial after the regular forms of advertising effort have been developed to their maximum efficiency. There is a proper place for every type of advertising. Keep the proper position of each and the results will be beneficial. In general, no novelty or good will article

The only justification for advertising, after all, is that if it is properly carried out, it will pay dividends. And in order to make advertising pay requires more than a hasty speculation of what will work and what will not work.

Advertising can only carry its own burden of expense and responsibility. It is a highly specialized form of salesmanship that requires the most astute vision and preparation to make it successful. After you have analyzed just how much you think you can afford to spend for advertising, figure out a conservative campaign based on good judgment and then go into it with confidence and enthusiasm. Such campaigns never fail to reap their proper amount of good will and added business.

SPACE GOING FAST FOR PACIFIC EXPOSITION.

H. P. Jacobsen, president and chairman of the Supply Men of the Pacific Ice Cream Industry, under whose auspices the ice cream exhibition is to be held at the Pacific Slope Dairy Show in December, has requested *The Ice Cream Review* to make announcement that Eastern exhibitors who contemplate taking advantage of the show should get in their applications at an early date. Mr. Jacobsen reports that widespread interest is being taken in the exposition, and many of the large supply firms of the East are among those who are making early registration.

H. P. JACOBSEN.

As previously announced in *The Ice Cream Review*, this exposition brings together all the associations of the Pacific Coast. The Pacific Association of Ice Cream Manufacturers some time ago accepted the invitation of the California and Southwestern States' Association to hold its exposition jointly at the time of the Dairy Exposition on the coast, and all associations taking part in this event expect record gatherings of members.

DIXIE ICE CREAM CO. REMODELED.

New machinery has been installed and the plant of the Dixie Ice Cream Company on Cotton Ave., Macon, Ga., has been completely remodeled. According to officials, no expense has been spared in making the plant modern, complete, and sanitary in every respect.

The Macon company manufactures "Supreme Ice Cream" and Mr. Trawick says: "Business is good throughout Macon and Central Georgia and the increased business has forced us to enlarge the plant." Mr. Trawick also claims that his firm is the originators of "boiled custard ice cream," and he says they will specialize on this brand this season.

NEW ENGLAND ICE CREAM MANUFACTURERS MEET AT MASSACHUSETTS AGRICULTURAL COLLEGE.

Following the May meeting of the New England Ice Cream Manufacturers' Association, held in Springfield May 21, virtually the entire group, and some others, met at the Massachusetts Agricultural College May 22. By 10 a. m. about forty had arrived at Flint Laboratory, the dairy building. After looking about the building the visitors took part in an ice cream scoring.

Thirteen companies submitted nineteen samples, sixteen vanilla and three chocolate, to be scored. The samples were sampled and tested the day previous for fat, total solids and bacteria. The group discussed and scored the samples for flavor, body and color. Three samples were examined at a time, and, with Professor Judkins at the blackboard, opinions of various members of the group were obtained and classified. With very few exceptions a large majority of the group placed the various samples in their proper classes, although it was not always possible to account for the particular defect present.

Everybody felt the work very profitable, as it gave opportunity to observe a variety of tastes, textures and colors, all of which is bound to make a more standard article.

In addition to scoring the samples, each sample was weighed and it was found that the weights varied from 4 to 6 pounds to the gallon, the average being 4.67 pounds.

One man dished a quart from each of five samples the average weight per quart being 26.8 oz. Another man dished a quart from each of 13 samples the average weight per quart being 22.4403. The weights of dished quarts varied from 18.5 oz. to 33 oz. The quart that weighed 33 oz. was dished from the gallon that weighed 6 pounds. Other than this there was no relation between the weight per quart and the weight per gallon, showing that the number of quarts that would be obtained from gallon lots of different ice creams would vary widely.

The fat tests varied from 9.03 to 14.56 per cent, with an average of 12.16 per cent. The total solid tests varied from 35.14 to 40.5 per cent, with an average of 37.76 per cent.

The samples as a whole were of better flavor and showed better workmanship than those sent to previous scorings.

At 12:30, thirty-five sat down to a real dinner in the college dining hall. There was plenty of fun for good digestion with Jim Tait of Tait Bros., Springfield, playing the leading roll.

After dinner a tour was taken through the new chemistry building now nearing completion. The scoring was then completed, and, judging from the impressions left by some of the men, there is considerable regret that they cannot enter college with the freshmen next fall.

MAXWELL VERDE SMITH.

Word reaches us from C. J. Yunker, president of the Michigan Dairy Boosters, that Maxwell Verde Smith, son of C. J. W. Smith, 561 Continental Ave., Detroit, Mich., died recently after a long siege of illness. The son was thirty-one years of age. C. J. W. Smith is a representative of the Creamery Package Mfg. Co., and also is secretary and treasurer of the Michigan Dairy Boosters.

Making The Employees Interested

The New Haven Dairy Co. Has Developed the "Human Contact" Element to Eliminate Labor Troubles

MANY ice cream manufacturers lose sight of the importance of the human side of business. The ice cream industry is no different from any other line of business in the personal aspect of relations with employees. Mechanical operations alone can never work for perfection in any line of business, regardless of how great will be improvements in machinery and plant efficiency.

The New Haven Dairy Co., New Haven, Conn., shows

CHARLES G. MORRIS.

an interesting insight into the importance of the human side of business, in its annual report. In this report, Charles G. Morris, president of the company, tells what his company has done to keep the different members of his organization in close personal contact. Mr. Morris pointed out that it was easy for officers of the company to keep in close personal contact with every employee who has been with the company long enough to be classed as permanent when the company employed only fifty or sixty persons, all but

three or four being in New Haven. But now this company has grown to the point that even in the slack season it employs a force of well over 350, increasing with the increased demand for ice cream.

Moreover, this force is scattered among nine different central locations, the smallest doing about as much business as the New Haven plant alone did in 1906, and more than double what the Hartford branch did in that first year.

VARIOUS plans were tried by the New Haven company to overcome the effect of this separation of their workers from their superior officers. One plan

that has worked well in this connection is very interesting. It consists of an annual reunion and dinner. Three hundred and sixty-five employees were at the annual dinner held this year. Employees were asked to sit at random and to avoid sitting next to those who work with them. The foremen and office men were scattered as widely as possible through the group. Mr. Morris personally tried to greet each one separately as they entered the dining room. The officials avoided set speechmaking and yet tried to present to their employees as they were gathered some phase of their work which was of common interest.

The distribution of the money obtained from the company's operations for a year was discussed at the recent meeting. The talk being illustrated with a chart. In addition to this annual meeting, Mr. Morris tried to make it plain that his time is always at the service of his employees who need advice on any subject. Of course, he sometimes finds problems he cannot solve, but he has been able to help in many instances.

THE profit-sharing dividend in force with this company is another interesting detail of contact. "If the company has a profitable season and can pay its stockholders a dividend on the capital value they put into the business," Mr. Morris says, "officials intend to pay our employees a dividend on the labor value they put into the business."

"It seems to us that a workman may properly share in the prosperity, or lack of prosperity, in the industry to whose operations he contributes his work as the owners (the stockholders) contribute their capital. Both are seeking profit, either in the form of wages or dividends, by their participation in the enterprise. If it is not efficiently conducted in all departments, both may suffer. If it is efficiently conducted in all departments, both are not only protected against loss, but may well share in the gains which their participation in the enterprise has produced. These dividends are usually made in the form of one-year certificates of deposit, and a casual inquiry indicates that three-quarters of these become savings accounts at maturity."

"Taking it in the long run, it appears probable that if the employees can be kept in touch with the personality of the officers; can be informed correctly as to their real part in the conduct of the enterprise, and can have a share of the success which their conscientious efforts may produce, they can hardly help having a more intelligent and, therefore, keener interest in doing their daily work well and avoiding waste either by themselves or others."

"We look forward to the coming year with confidence in our equipment, our managing force, our labor force, our products, and our market."

EASY COMPUTATION OF MIX.

(Continued from page 42)

nd in the case of the batch everything but the fat, ugar, e. g. 4 per cent milk contains 96 per cent serum, weetened condensed milk of 8 per cent fat and 40 per cent sugar would contain 52 per cent milk serum, gelatine, vanilla, and outside water used. The percentage f serum solids in skim milk, and cream is easily approximated by multiplying the per cent serum by .09. or instance, the per cent serum in 28 per cent cream ould be 72 which multiplied by .09 would give 6.48 per cent serum solids in that cream. With 4 per cent milk, he per cent serum solids would be 96x.09 or 8.64 per cent. For the condensed, sweetened condensed, powdered milk or skim milk the percentage of serum solids must e obtained by chemical analysis or may be approximated by calculations from hydrometer readings.

OUNDS milk products in batch or in condensed, of course, is found by multiplying pounds batch or ounds condensed by per cent milk products in batch : condensed and dividing by 100. So do not use per cent if the formula calls for pounds or vice versa. The er cent milk products is most easily found by subtracting the per cent of everything not contained naturally : milk from 100, sweetened condensed milk containing) per cent cane sugar for instance, would have 60 per cent milk products as everything but the cane sugar is rived from milk.

These formulas at first glance appear very formidable it, after all, are very simple to use as you will see. ll you need to do is to substitute your own figures. pplying these formulas to your problem and figuring per gelatine and .5 per cent vanilla, we get the folwing results:

1. Pounds sweetened condensed milk to be used in ie batch: Pounds of batch and per cent serum solids batch minus per cent serum in batch times .09 equals er cent serum solids in condensed minus per cent serum i condensed times .09.

$$\frac{20(10-70 \times .09)}{1-52 \times .09} = \frac{320(10-6.3)}{20-4.68} = \frac{320 \times 3.7}{15.32} = \frac{80 \times 3.7}{3.83} = \frac{296}{3.83} = 77.28 \text{ pounds sweetened condensed.}$$

2. Pounds of butter to be used in batch: Pounds atch times per cent fat in batch minus pounds condensed times per cent fat in cream minus per cent in ilk times per cent fat in condensed minus per cent fat i milk. Pounds milk products in batch minus pounds ilk products in condensed equals:

$$\frac{20 \times 14 - 77.28 \times 8 - 4(268.8 - 46.37)}{84 - 4} = \frac{4480 - 618.24 - 4 \times 22.43}{80}$$

EVERY MANUFACTURER IN DIXIE SHOULD BE A MEMBER OF THE SOUTHERN ASSOCIATION.

This is a typical installation of an eight and six-hole Frigidaire Cabinet in back of fountain.

Consider These Frigidaire Features

In design, construction and service, Frigidaire Ice Cream Cabinets have many distinct advantages. It will pay you to consider them very carefully.

A General Motors Product

Frigidaire Cabinets are the result of years of experience in the manufacture of electrical refrigerators for the home, plus the engineering skill of the great General Motors Laboratories.

National Service Organization

A nation-wide sales and service organization guarantees careful installation and prompt,

trustworthy service at all points, whenever necessary.

Immediate Delivery and Easy Terms

A large factory and volume production of Frigidaire Ice Cream Cabinets assure immediate delivery on all models in four hole single row sizes and four, six and eight hole sizes in the double row style.

Frigidaire cabinets are a General Motors product and the services of the General Motors Acceptance Corporation are at the disposal of those who wish to purchase through a special deferred payment plan.

All Liquid and Suction Lines Are Valved for Easy and Quick Service

An exclusive feature of Frigidaire Ice Cream Cabinet construction is the valve arrangement. All the liquid and suction lines have shut-off valves located at the cooling unit and compressor so that the entire unit may be quickly detached and replaced at any time without interfering with the service which the cabinet is rendering.

Removable Guard-Sleeves Save Copper Sleeves

Among the dependable features which give Frigidaire cabinets such long life are the hot-galvanized guard sleeves. These eight inch sleeves fit down into each compartment and protect the inner copper sleeves from any damage when the ice cream containers are put in or removed from the cabinet. These guard sleeves are easily replaced with new ones when necessary.

Galvanized Guard-Sleeve Being Replaced

New Insulated Top to Prevent Leakage of Cold

The polished monel metal top of the Frigidaire cabinet will not rust or corrode. The top is insulated with an inch of water-proof laminated wood and two inches of cork board. This construction greatly reduces the formation of moisture and separates the metal edges of the top and sleeves by more than 1½", minimizing the formation of frost in the sleeve.

Beaded Top Protects Ice Cream

Around each container opening there is a bead which has a very distinct advantage. Any surplus ice cream or foreign matter which may be spilled on top of the cabinet is stopped by this bead and will not run down into the compartment and contaminate the ice cream.

Side of Cabinet Removed to Show Method of Sealing

Fine Asphaltum Protects Cork Insulation from Moisture and Deterioration

The sides and joints of the four-inch cork board insulation are covered with hot hydro-lene or refined asphaltum. This forms an airtight seal between the insulation and lining and the insulation and outside of the cabinet, preventing the formation of moisture within the insulation. Because no deterioration can take place, the longer life so characteristic of Frigidaire Cabinets is made possible.

The Same Process as You Use in Your Hardening Room

The insulating of Frigidaire Cabinets is the same process used in the construction of your own hardening room. From this standpoint alone it may be seen how well the Frigidaire Cabinet has been built to give long and dependable service.

May Be Placed Where Most Convenient

Frigidaire Ice Cream Cabinets are adaptable to any installation. They may be placed in back or at the side of the Fountain. The mechanism comes self-contained in the cabinet or separate for installation in the basement or wherever most convenient.

Hendler's Model Plant Opened at Baltimore

150,000 Feet of Floor Space Provided in New Plant—Truck
Equipment Valued at \$250,000

THE Hendler Creamery Co. of Baltimore, Md., inaugurated the coming season by celebrating the opening of its enlarged and greatly improved plant on May 21, 22 and 23. The company was host to local dealers.

Tours of inspection were systematically handled by competent guides during the visiting hours. A light lunch and refreshments, together with a first-class vaudeville entertainment, was enjoyed by all. Appropriate souvenirs were given.

With the new additions the plant has approximately 150,000 square feet of working space and still room for expansion.

After registering, the visitors were given the opportunity of following the working operations of the manufacture of ice cream, beginning with the third or uppermost manufacturing floor, the large refrigerator for holding 10,000 gallons of raw milk products together with the dry stock room was inspected. From these two sources the liquid stock and the dry stock start off in their transit of manufacture.

Leading up from the receiving platform to the third floor is an Alvey can conveyor, which facilitates the rapid handling of cans into the refrigerator and the return of these cans from the can washer located on the same floor to the receiving platform.

From the standardizing tanks located between the refrigerator and dry stock room the milk products flow down through sanitary pipe lines to the second floor

where they enter three 500-gallon Elyria glass lined pasteurizers. From the dry stock room the sugar is placed in a 10,000 pound sugar bin which empties out on the ceiling of the pasteurizing room below. (Other products such as chocolate).

When the pasteurizers have received their supply of milk products from the standardizing tank sugar is added from the over hanging sugar bin and the entire mix is pasteurized, homogenized, and cooled, then stored in ten 1,000-gallon Elyria glass lined storage tanks where a frigid temperature is maintained until the mix is frozen into ice cream. A short and direct-connecting line leads between these storage tanks and the freezing room is located on a mezzanine floor.

LEADING down from the dry stock room are a series of metal shoots which convey the fruits into the tanks in a refrigerator adjoining the pasteurizing room. Here the fruits are kept cold until they are incorporated in the ice cream mix. Agitators in these tanks keep the fruit uniformly distributed. By the same shoot arrangement cocoa products, sugar, etc., are conveyed to an Elyria glass lined chocolate cooker in the pasteurizing room. Pipe lines lead from the fruit tanks and chocolate cooker into the freezing room by short and direct connections where measured quantities of fruit and chocolate are put into the freezers.

The mix flowing from the storage tanks enters automatic batch fillers which allow a definite volume of mix into each freezer. Eleven freezers constitute the freezing battery—The ice cream from eight of these empty into a hopper having a central outlet and then flows to the can-filling room below where it is fed through a ribbon valve into the cans. The equipment made under Hendler Creamery Co. specifications and is the first of this design to be used in the country. It is constructed of monel metal and has a brine jacket throughout its length. Three freezers have individual hoppers and are exclusively used for the production of Harlequin ice cream. At this point emphasis may be placed upon the method of handling the fruit.

The large 3-inch sanitary pipe line leading from the fruit tanks mentioned before ends in a valve just inside the freezing room. A small passageway separates these valves from the battery of freezers and this arrangement facilitates rapid handling of the fruit. The same method for handling the fruit applies both to the bulk as well

as to the Harlequin ice cream. It might also be added that the control valve for the batch measure, the brine valve and the motor switch to each freezer are within a working radius of two feet.

A control of freezer works automatically and acts as a lookout for the balance of the freezers.

The can-filling and packaging machines are located on the first floor directly beneath the freezers. The ribbon valve attached to the bulk ice cream hopper and which is now used for filling the cans will be replaced by a can-filling machine.

The hoppers from the three freezers used for producing Harlequin ice cream, enter directly into the hopper of a Mojonner automatic brick packaging machine. In the near future an automatic package lining machine will be used in conjunction with the brick packaging machine.

A power conveyor carries the cans directly from the can-washing room to the ribbon valve attached to the bulk ice cream hopper. After the cans and packages have been filled they are carried by power conveyor to their respective positions in the hardening room. The hardening room located between the can-filling room and the shipping platform has a capacity of 40,000 gallons of ice cream. In addition to this complete equipment for producing ice cream under most sanitary conditions, a delivery truck equipment representing an investment of about \$250,000.00 takes care of delivery of the product.

THE housing and repairing of this equipment is taken care of in a two-story, fire-proof garage. To facilitate the repair work an 18,000 pound Otis elevator is capable of lifting a 5-ton truck fully laden from the first floor to the second floor where the repair shop is located.

BESSIRE & COMPANY

INCORPORATED

INDIANAPOLIS
MEMPHIS

LOUISVILLE
ATLANTA

Two ice tanks produce sufficient ice to ice the dealer's cabinets and refrigerate the bodies of the delivery trucks, 100 tons of ice being produced daily.

Shallow wells supply the ammonia condenser coils with water and also the water necessary in making the ice. Ice crushers and salt shoots are conveniently located along the driveway leading to the shipping platform and are supplied with ice directly from the ice storage rooms.

All the refrigeration is produced by two 100-ton compressors, one 75-ton compressor and one 50-ton compressor. All this equipment is operated by electricity received from the local power and light company and transformed from high line voltage to inside 220-110 power and lighting voltage. An automatic charging panel supplied by three motor-generator sets furnishes the current necessary for charging the electric trucks.

An auditorium capable of seating 350 people and a stage with complete lighting effects is a novel feature of improvement. A practical laboratory, measuring up to the best in the country has a decided advertising advantage, being located on the first floor of the building behind a large plate glass window and facing the main thoroughfare.

The returned cans are thoroughly washed, sterilized and stored in a semi-inverted position on the Hendler can truck until ready to be used.

ICE CREAM FOOD VALUE PROVED BY WEIGHT TESTS.

Recently in one of the schools in Cumberland, Md., it was decided to conduct nutrition tests, using milk products as a basis and ice cream was chosen as the product to be used. The tests were conducted in a class in which there were 46 children, 25 boys and 21 girls, ranging from six to eight years of age. Previous to the test each child was weighed and measured for height and it was found that 19 of the children were undernourished, that is, more than three pounds underweight for their height and age.

During the test each child was given one-fifth of a quart of plain vanilla ice cream every school day for nine consecutive weeks, after which they were again reweighed. In comparing the final weight with the original weight the following facts were noted:

One child gained four pounds.
Two children gained three and one-half pounds.
Three children gained three pounds.
Three children gained two and one-half pounds.
Nineteen children gained two pounds.
Five children gained one and one-half pounds.
Ten children gained one pound.
One child's weight remained the same.
Two became ill and could not finish the test.

Other interesting facts are to be noted in connection with this test. Every child except one gained more weight than the normal weight for this period which is about 12 ounces. Six undernourished children gained sufficient weight to bring them up to normal. True, the children did not gain as much weight as in the test where milk was used but the gain made in weight as the result of feeding ice cream was sufficient to realize the importance of it in the diet of children.

Ice cream is a food for all. Whatever can be done in the schools can be done in the home, both for the children and adults. The consuming public is ignorant concerning the food value of your products—through your advertising make it wise and two gallons will be sold where one was previously sold.—From bulletin of Indiana Manufacturers of Dairy Products.

R. L. HAMMOND,

General Secretary.

Cremo--the fastest selling Cone in the World!

We make the most delicious cone in the world by using ingredients too good to be bettered—finest flour, pure cane sugar, milk and vanilla.

After it is made, we pack it properly and ship it promptly.

Newspaper and billboard advertising constantly remind the public that good ice cream tastes better in Cremo Cones. Cremo is the only nationally advertised ice cream cone.

These are the very good reasons why more Cremo Cones are sold than any other cone.

Getting Your Product Over To The Public

Dealer Must Be Educated as Well as Consumers. Habit and Custom Govern Consumers

By HAROLD A. SINCLAIR*

SOME people depend solely upon advertising and salesmanship to put their product into the hands of the buyers; but from the standpoint of the practical merchant—the man who stays in business in spite of high manufacturing costs, low selling prices, strikes and numerous other ills that Business is heir to—getting a product over to the public necessitates not only advertising and salesmanship; but calls for the combined efforts of the entire organization, from the boss down to the errand boy, to make an enterprise truly successful; and that means, to give the buyer a product that will net him satisfaction, and the seller a fair profit for his labor. Where there is business accord there is bound to be success.

Therefore, a careful picking of employees is a very important part of the game. Much depends upon the tenor of the workers who help to place your goods on the market. The man who bosses the job must be a psychologist along with his other attributes, if he is going to get top-notch results from the people on his payroll.

Select the right man for every job, and if he proves worthy, don't be afraid to let him know it. Appreciation is the incentive to further effort, and he is a wise employer who can make his men feel that they are a necessary part of the business.

* Address before convention of the Pacific Coast Ice Cream Manufacturers' Association, Vancouver, B. C., Canada, December 3-4-5, 1923.

You can't run a business with squeaking machinery. The milk of human kindness is the best lubricant for any enterprise, and will keep the works humming merrily, happy to be part of an organization that metes out consideration as well as pay checks. Fortune will smile on the man who has the confidence and respect of those who work for him, for that type of man realizes the importance of keeping every cog in the machinery of his business moving smoothly and steadily in the same direction,—with profit as the incentive,—profit for the organization and the public it serves. For, no business is a good business if it doesn't provide satisfaction for the buyer and contentment for itself.

A dissatisfied or inefficient group of workers are parasites that thwart business progress. If you aim for minimum costs and maximum quality, weed out the parasites. Progress is the road that leads to success, and we travel it via the efficiency route, or we don't arrive! It's a long and hilly road, and if we fail to heed the danger posts, or,—as Mr. King puts it, Stop, Look and Listen—we'll fall over business snags and come downhill at no-stop speed. We go up at a jog-trot; but it's the "limited" that brings us down—limited vision mostly.

SOME of you are going to raise an eyebrow when I tell you to beware of the business boom! Well, raise your eyebrows if you want to, but breast the tide of abnormal prosperity cautiously, because if you don't, it will sweep you off your feet and carry you out on its receding current. When the business boom comes in like a lion, be careful it doesn't take you out like a lamb—a shorn lamb!

Sporadic periods of prosperity—we call them "business booms"—tend to warp our business perspective. We rush to supply the increasing demand. Operating costs, budgets—even the quality of our product—are submerged or forgotten in our efforts for maximum output. Conservative business methods are crowded out by the inrush of orders, and enterprise is strained to the utmost to satisfy trade's ever-increasing call for goods. Getting a product over to the public is a very easy matter at such a time.

Then a lull intervenes. The wave of prosperity recedes, and in its wake we catch sight of inflated costs, increased depreciation due to careless handling of machinery,—a payroll padded with overtime, and a general let-down of fixed rules and regulations that make for efficiency. Then, and then only, do we begin to realize that the "business boom" is camouflaged failure for those who throw caution to the wind and overlook the fact that they are building for the future as well as the present.

Now, periodical business is a species of business boom, and most of us assembled here today have suffered from this nerve-racking, spasmodic form of prosperity. We run a marathon for a few months, then pant from the strain for the next few months, and while we mop our brows, we calculate there'll be some tall repairs needed in equipment, etc., and we get busy again making ready for the next season's rush, and at the end of the year we do a little hasty figuring, and breathe a sigh of relief if we come out even in the game of hustle and bustle. The ice cream industry is like a comic opera—full of

runs and rests; the only difference between the two is that the opera is comic, but there's nothing funny about the ice cream industry—particularly in the winter time!

Who is to blame? I'll tell you—habit and custom. They're the fickle twins that gorge the public with ice cream in the summer and freeze up your sales in the winter.

What are you going to do about it? You can't get rid of habit, any more than you can eliminate custom. While there's life **habit** will be with us, and so long as civilization remains, **custom** also will survive.

But, my friends, we can regulate habit, and we can change custom, and, if we go about it in the right way, these two human kinks in the game of life can help to put your product over to the public in a fashion that will amaze you, and make you happier and richer men.

YOU have to coax habit and custom with publicity—and that means systematic propaganda, co-operation with competitors as well as with dealers. Your dealers will find it easier to do the selling if you do the telling. Your appeal should be made to the consumer. Educate the public to eat ice cream regardless of weather,—get everybody thinking about ice cream,—the housewife, the dairy professor, the doctor, the tired business man, the kids, and—well, just everybody, that's all.

Who made winter furs popular in the summertime? Habit and custom. Who created a demand for chiffon hose in zero weather? Habit and custom. Wrigley may have started the chewing gum craze, but habit and custom keep us chewing it.

Not further back than twenty years ago, no home was complete without a harmonium and a cuckoo clock. But habit and custom have replaced them with the Big Ben and the talking machine.

Look at all the persuading and educating and advertising it required to convince old man "Hayseed" that it would pay him to replace his work-horses with motive power. But habit and custom finally showed him the error of his stubbornness,—gave him motor-driven implements to work with, and a motor car to carry him around to his neighbor's husking bee.

Systematic propaganda will start habit and custom doing teamwork to get your product over to the public regardless of seasons. A national market can be developed by co-operative advertising. Countrywide propaganda will start custom prodding the sides of the ice cream habit, and individual appeal to local buyers, co-operating with them by furnishing a uniform quality product, backed by helpful advertising and prompt and reasonable service, will do the rest. Let your association tell the world how fine ice cream is for the stomach, while you busy yourself convincing your dealers that your particular brand is the best for their customers.

THERE was a time when the salesman played the leading role in the selling game; that was in times gone by—when "let the purchaser buy at his own risk" was a popular slogan; but in these days of keen competition, 'tis the merchant that sells at his own risk, and while initial orders may depend largely upon a salesman's personal appeal to the buyer, and his ability to talk convincingly, subsequent orders are the direct result of the value the buyer finds in his purchase.

The salesman who represents a conservative, up-to-date enterprise, operated on an honest basis, must uphold its established principles of efficiency, courtesy, co-operation. He must know a lot about his product, and as much as possible about the man he is trying to sell. A salesman doesn't have to be a silver-tongued orator; but

DEPENDABILITY

The value of efficient and reliable workers is that they can always be depended upon to carry a given task through to a finish.

This is also the secret of the constantly growing demand for

Wyandotte
Dairyman's
Cleaner and Cleanser

Manufacturers of ice cream have learned by the thousand to place absolute dependence upon this cleaner for all their plant cleaning work.

For they have always found its quality to be uniform and of unvarying superiority. They have always found its cleaning action quick, easy and harmless to user and equipment. They have always found its free rinsing a guarantee of faultless cleanliness and a protection to quality products.

Moreover they have always found its use so productive of economy that it is a definite factor in the profitable operation of ice cream production.

Dayton Est. 1895 Ohio

if he is in earnest and knows what he is talking about he will impress the buyer and stand a good chance of booking his order.

The other day, a group of newsboys impeded my progress toward a railroad station, each trying to sell me a newspaper; there were four of them, I think. One shoved the Telegram under my nose; another tried to hand me the World, while a third yelled—"Buy the News, Mister, it's full uv pitures," and the fourth—a puny little chap, piped up—" 'ere's the paper you want, Mister, taint 'ard on yer eyes, look 'ow big the print is, —easy to read on a train." I bought that paper, in spite of the fact that it happened to be a newspaper I usually do **not** buy. That little fellow will make a crackerjack salesman some day. He knew the value of **personal** appeal. That's the point—a sales should be based on facts that will interest the person you are trying to sell.

Your salesman should study the prospect's requirements, and then convince him that your product will exactly meet those requirements. He should visit the buyer, not just call on him for an order. Find out how he liked the last shipment; did it prove satisfactory, etc., etc. Show the buyer that you are interested in his success, and make him feel that his success is due in some measure to the orders he gives you.

A salesman should look upon his customers as friends; look out for their interest by selling them satisfaction, and he can do this by selling them what they need—and see to it that his organization **delivers** what he sells.

The successful ice cream salesman today doesn't knock his competitors, or quote unauthorized prices, or make rash promises that he has no intention of living up to. His missionary work among dealers has firmly established in their minds, the value of quality ice cream, made under scientifically healthful conditions, put up in sanitary containers, a wholesome product that will be good for their customers, and consequently good for their business.

Bread may be the "staff of life," but milk strengthens the backbone of the nation; science deems it man's most nourishing all-satisfying food, and ice cream is the most digestible and most nourishing of milk products. Therefore, the ice cream salesman should impress upon the dealers the need for careful handling of this dairy food, the importance of choosing the finest quality ice cream, packed in absolutely clean and sanitary containers. A dealer who realizes the value of supplying his trade with pure ice cream, of excellent flavor and good keeping quality, is not impressed by the over-talkative salesman who harps upon giving him a special inside price and an extra pint to the gallon, etc., etc. Sooner or later, the dealer wakes up to the fact that if he wants to make his business a success, he has got to give his customers the kind of ice cream they will want, not only once, but all the time,—a nourishing, wholesome, dependable food that is good for every member of the family.

The average consumer—and dealer, too, for that matter—regards ice cream as a pleasing dessert,—a luxury to be indulged in more frequently during warm weather. Educate the dealers and the consumers as well, to know the real value of this dairy food. Many people—adults as well as youngsters—find milk difficult to assimilate; but everybody can digest ice cream—that is, ice cream as it is made nowadays—scientifically, with the purest ingredients. Liberal use of dairy foods reduces the cost of living and raises the health standard tremendously.

A MAN'S business should be a monument to his best endeavors, and when a man is honestly successful he has good reason for pride in his achievement. We are all more or less proud of the enterprise we represent;

but the men who manufacture food that tends to fortify and augment the general health of our people have the greatest reason to feel that their part in life is indeed an important one.

To my mind, the manufacturer of good ice cream should be counted among our leading citizens; for his work is for the nation's good, since his product is wholesome nourishment of the most delectable kind. His suppliers should help him put his product over to the public by selling him the best ingredients his money can buy; his salesmen should help him put his product over to the public by selling his ice cream and not their own personalities, and his working force should help him put his product over to the public by doing their best to make his ice cream truly good.

No successful business today is operated single-handed; it takes the co-ordinate efforts of everyone on the payroll to get a product over to the public, and the man who knows how to build up a harmonious enterprise is bound to prosper; for harmony is the keynote to successful achievement.

We have the biggest market in the world, and despite competition, financial depression and fluctuating world conditions, success awaits those who put energy, personality, intelligence into their business; who have a sincere regard for worthy competitors, and the wisdom and ability to ignore those business bunglers who pop up in every industry, and try to crowd out the honest merchant by lying, cheating and giving their product away.

The business association helps us to keep our industries on an amicable, dignified basis. I love the word association; it symbolizes friendship, union, strength; and a trade association, such as this, is simply a brotherhood of business men banded together for the purpose of sympathetic accord, the ethical conduct of business affairs, and the desire to co-operate with one another, toward the end that each may enjoy the fruits of his labors and go forth imbued with the spirit of good fellowship, glad of the privilege of doing his part in keeping the world moving onward; for, as the saying goes—"That which is not for the interest of the whole swarm, is not for the interest of a single bee."

And so, I say again—pull together, men! Combine your efforts to exterminate the fleas that irritate the hide of legitimate business, and by your unity make it hard for stray trouble-makers to "rock the boat!"

BUSINESS QUESTIONNAIRE NO. 23,

(Supplemental Income Tax Report for Dairy Products Manufacturers.)

1. Are you married or single.....Why.....
(Answer fully)
2. Did you withdraw any money from the bank during the past year? If so, where the "L" did you get it to put in the bank in the first place?.....
3. Are you on friendly terms with your relatives?.....
If so, why?.....
4. Can you give us the name and address of anyone who has less intelligence than yourself, yet making more money than you are?.....
5. When the volume of business is low during the winter months, do you wear a belt or suspenders?.....
6. State average monthly grocery bill and payments, if any.....
7. Do you drink?.....If so, where do you get it?.....
(Treated confidentially)
8. Exclusive of bootleggers, how many people are dependent on you for support?.....
9. Do you keep chickens?.....
Does your wife know it?.....
10. Are you troubled with cold feet?....Whose?.....

The Benefits of Homogenization in Ice Cream Making

How it Has Proved to be a Process of Fundamental
Benefit Toward Good Quality

By O. E. WILLIAMS*

HOMOGENIZATION has proved to be a process of fundamental benefit in securing good quality in ice cream; and moreover, it is an economical practice. The benefits derived from it are noteworthy, and deserve careful consideration by ice cream manufacturers who are endeavoring to improve the quality of their product.

The benefits of homogenization in ice cream making may be divided into two general classes, regular and irregular. By regular benefits are meant those which accrue in the regular process of manufacture under normal and favorable conditions; by irregular benefits, those which may be helpful in emergencies.

There are six regular benefits of homogenization:

- (a) Increased viscosity.
- (b) Reduction in time required for aging.
- (c) Less physical and mechanical loss of fat.
- (d) Better whipping qualities.
- (e) Better freezing qualities.
- (f) Greater uniformity and palatability.

Each benefit represents an industrial gain, some of which are more important than others, depending mainly

*Dairy Division, United States Department of Agriculture. An address before the Seventeenth Annual Convention of the Association of Ice Cream Manufacturers of Pennsylvania and New Jersey, at Altoona, Pennsylvania.

on the manufacturing conditions. Let us briefly consider each benefit in detail and see what homogenization really means.

(a) Increased viscosity. One of the first requisites for making an ice cream of smooth texture is to have the cream or mix possess a good viscosity. Newly received, freshly separated, and pasteurized cream will not have sufficient viscosity unless the cream or mix is aged. Sometimes certain thickeners are used, but these often react unfavorably. Gelatine is also depended upon to some extent for viscosity. Homogenization has corrected much of this trouble, because it will produce a viscosity in fresh pasteurized cream many times greater than the original viscosity. The transformation that is effected in this one respect alone has been a splendid achievement. This phenomenal increase in the viscosity has accomplished more than a physical change; it has stimulated new interest on the part of dairy students and a new interest in quality control, all of which has helped to systematize and improve the manufacture of ice cream.

(b) Reduction in time required for aging. The practice of having to hold either the cream or the mix for several hours and often days to obtain sufficient body has been partly eliminated by homogenization. It not only hastens the handling of cream in the factory, but indirectly encourages pasteurization and standardization rather than disregard of them.

(c) Less physical and mechanical loss of fat. In the manufacture of ice cream there has always been more or less physical and mechanical loss of fat due to whipping and churning. This condition became worse as the ice cream industry left the slow tub stage, because when pumps, rapid stirrers, and faster turning freezers were installed, the fat losses were greater.

SOME idea may be obtained of the physical losses of fat occurring in a modern brine freezer from the photographs I have with me.

(d) Better whipping qualities. Did you ever see an ice cream maker start out with 50 pounds of very nice cream mixture in a freezer and produce about 7 gallons of ice cream that tasted fairly good when soft but was decidedly buttery after it had been hardened?

That is what often happens with cream that is not homogenized, and especially if the cream mixture is rich or has not been previously chilled. A good illustration of how the yield in a modern freezer is usually increased by homogenization is shown in a comparison of two sets of mixes, treated differently, one containing 12 per cent fat and 10 per cent milk solids not fat, and the other 16 per cent fat and $5\frac{3}{4}$ per cent milk solids not fat, the difference in treatment being only in homogenization, as follows:

Percentage yield of mixes of different composition under different treatment with respect to homogenization.

	Mix contain- ing 10 per cent fat and 12 per cent milk solids not fat Yield, per cent	Mix contain- ing 16 per cent fat and $5\frac{3}{4}$ per cent milk solids not fat Yield, per cent
Homogenized mix	84	96
Homogenized cream	84	98
Not homogenized	63	54

(e) better freezing qualities. The difference between the rate of freezing and consequent size of the ice crystals in homogenized and non-homogenized cream is also very marked. The fact that there are not so many complaints regarding the coarse, icy, and almost spiny texture today as there were a few years ago is due partly to homogenization.

(f) Greater uniformity and palatability. There are very few manufacturing concerns today that are not anxious to maintain as nearly as possible a uniform product. The manufacturers of ice cream are no exception to this rule.

ONE of the greatest difficulties that used to confront the manufacturer of ice cream in trying to maintain a uniform composition was due to the natural instability of the fat. Of course, crude methods have been partly to blame, but as we have already observed there are many possibilities for the fat content to vary in different packages of ice cream and also in different portions of the same package. This, to a large extent, has been overcome by homogenization.

The effect of homogenization on the palatability of ice cream is also surprising. In two experiments, each representing four days' sales, the percentage of persons that preferred ice cream made from homogenized cream was 90.6 and 99.4.

Now consider for a few minutes the irregular benefits. There are only two irregular benefits obtained from homogenization—(a) the benefit derived from producing remade cream and (b) the benefit derived from re-emulsifying frozen cream.

Have you ever wondered why there has been so little said or written about the merits of homogenization, particularly as it is applied to the ice cream industry? I have, and I believe it has been due partly, at least, to a common attitude held by investigators and manufacturers alike that homogenization in ice cream making was a process used principally for the purpose of producing remade cream from butter (often poor butter) and skim milk—a practice unbecoming to an industry that was supposed to take pride in having need only for the best grades of sweet cream. This being the case, those who are interested in the welfare of the industry naturally did not care to advertise homogenization.

Unfortunately, not many of the experiments on the manufacture of ice cream have been based on homogenized cream, and it is likely that the significance of the irregular benefits had something to do with this. Re-

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

made cream, obtained by homogenization, when made from good butter, may possibly be considered far superior for ice cream purposes to some grades of original cream, and especially to neutralized sour cream, or as it is sometimes termed, "doctored cream;" but experience has shown that it is best to disregard even this irregular benefit as much as possible. The practice, therefore, of using homogenization as a means of obtaining an adequate quantity of cream is not relied upon a great deal today; hence, it is here termed an irregular benefit.

The second kind of benefit not found under ordinary conditions is in the utilization of frozen cream. Freezing tends to separate the fat from the serum and homogenization makes it possible to re-establish the emulsion. This practice is also very limited.

The principal benefits, therefore, of homogenization to the business of ice cream making are the regular benefits. They are assets, the significance of which are far-reaching. It might be made more useful if the dealers and consumers were told about it as they have been told about pasteurization. I believe the progressive manufacturer will have lost an opportunity to increase his sales by failing to recognize the true merits of homogenization in his sales talks.

MILWAUKEE ICE CREAM MEN PARTICIPATE IN EXPOSITION PLANS.

George D. Mansfield, head of the Mansfield Ice Cream Co., Milwaukee, is chairman of the ice cream division of the National Dairy Club of Wisconsin, the organization formed to make preparations for the National Dairy Exposition. This committee is interesting itself in taking care of the ice cream men that attend the exposition, cooperating with out-of-town manufacturers in their preparations to attend.

Milwaukee's ice cream manufacturers are loyally behind the committee, which includes William F. Luick, former president of the National Association of Ice Cream Manufacturers; Arthur H. Graeszell, secretary of the Wisconsin Association of Ice Cream Manufacturers; Walter Bendfelt, treasurer of the Wisconsin association, and other manufacturers of Milwaukee and the state-at-large.

The dairy club meets every two weeks, and the ice cream manufacturers attend to confer with representatives of seven other divisions of the dairy industry.

Farm leaders and all classes of business men are cooperating with dairy officials in preparation for the National Dairy Exposition in Milwaukee, September 27 to October 4, and as these plans go forward evidence increases that the exposition will be the most largely attended of any past event of this kind. Ice Cream manufacturers of most every state in the Union are laying plans to attend. There will be features of especial interest to ice cream men this year.

Measuring Quality in Ice Cream

By R. C. FISHER* and H. F. JUDKINS**

UNIFORM good quality ice cream must be one of the biggest assets in the continued expansion of the ice cream industry. What are the factors that make up quality in ice cream?

The butter and cheese industry solved these questions sometime ago and a uniform system of grades and standards have been developed. So far no such grades and standards have been developed in the ice cream industry.

Different score cards and other systems of measuring quality have been suggested from time to time, but none of these have become standardized. In view of the fact that ice cream is now included in the Educational Students Dairy Products Judging Contest at the Eastern States Exposition, and that serious consideration is being given towards including ice cream in the national contest, it seems very desirable to establish some uniform system of measuring the quality of ice cream.

It is with this idea in mind and in the hopes of opening up a thorough discussion on the subject that the writers suggest a score card and a system of grades and standards. According to this score card, the factors that make up quality in ice cream are: Flavor, body and texture; fat and total solids; color and package. The score card measures these quality factors by assigning to each a certain value which is as follows:

Flavor.....50 per cent
Body and texture.....25 per cent
Fat and total solids..20 per cent
Package and color.... 5 per cent

Obviously, it is very seldom, if ever, that a sample of ice cream, butter or cheese, is given a perfect score of 100. No one actually knows what perfection is and some allowance must be made for this. In general a sample receiving a score of 90 per cent or above may be considered excellent, while a score of 80 to 90 would be representative of a good quality of ice cream. A score card or yard stick for measuring quality similar to the above, has now been used for two years at the Eastern states dairy products judging contests and also at the educational scorings at the Massachusetts and Connecticut agricultural colleges. At each of these educational scorings, about thirty-five commercial samples from all over New England were received. At these occasions the score card has proven its practicability and value in measuring quality factors in ice cream, provided a uniform system of grades and standards can be worked out. To start the ball a rolling and open up an opportunity for exchange of ideas, the following plan is suggested:

Flavor or Palatability.

The quality of the flavor of ice cream may be classified from the standpoint of palatability under four general groups:

1. Highly pleasing and desirable: Flavors rating 45 to 50 points.
2. Desirable flavors: Flavors rating 40 to 44.9 points.
3. Objectionable flavors: Flavors rating 35 to 39.9 points.
4. Foreign off flavors: Flavors rating 25 to 34.9 points.

I. Highly Pleasing and Desirable Flavors:—Rating 45 to 50 Points.

Ice cream that is especially fresh, clean, sweet and well blended in flavor, having the proper degree of sweetness and flavoring and having a certain creaminess or richness in flavor characteristic of the pleasing flavor and aroma of fresh sweet cream, shall receive a rating of 45 to 50 points.

II. Desirable Flavors:—Rating 40 to 44.9 Points.

Ice cream that is fresh, clean and sweet in flavor, but high or low in sweetness or flavoring material, shall be given a rating of 40 to 44.9 points.

AND

REBUILDING

OF

MILK & ICE CREAM CANS

BEFORE

AFTER

THOMPSON BREMER & Co.

1750 CARROLL AVE. CHICAGO

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

III. Objectionable Flavors:—Rating 35 to 39.9 Points.

This class includes ice cream that is free from foreign or (off) flavors but shows objectionable flavors, such as old cream, old butter, bitter, cowy, cheesy, cooked, condensed or powdered milk, gelatine or poor quality flavoring material. Such ice cream shall receive a rating for flavor of between 35 and 39.9 points.

IV. Foreign and (off) Flavors:—Maximum Rating 25 to 34.9 Points.

These include flavors, ordinarily termed foreign flavors or (off) flavors and which are distinctly disagreeable to the taste. Ice cream showing pronounced salty, rancid, garlic, gasoline, disinfectant, unclean utensils or other foreign or (off) flavors distinctly disagreeable to the taste, shall be given a score of 25 to 34.9 points.

Ice cream with pronounced sour or other flavors bad enough to make it unsalable, shall be score 0 on flavor.

Note: Ice cream is never scored perfect in flavor, as no one knows what perfection is and two to four points must be allowed. A score of within two to four points of perfect may therefore be considered excellent.

Body and Texture.

Class I.—Rating 23 to 25—Ice cream receiving the rating of 23-25 must be firm, mellow, smooth, creamy and velvety in body and texture.

Class II.—Rating 20-22.9—Ice cream that is slightly fluffy, snowy, icy, grainy, buttery or soggy shall receive a rating of 20-22.9.

Class III.—Rating 15-19.9—Ice cream that is sandy, pronounced soggy, buttery, icy, coarse, gelatin lumps, shall receive a rating of 15-19.9.

Fat And Total Solids or Food Value.

Allow perfect score if fat is 12 per cent or over and total solids 36 per cent or over. Deduct one point for every per cent below 12 and one point for every per cent total solids below 36.

Package and Color.

A. The suggested standard color for vanilla ice cream is the color of Guernsey or Jersey cream during the month of June or July with allowance for deeper shades of color when eggs are used in the mix. However the different markets vary greatly regarding the degree of color desired in ice cream. In the case of vanilla ice cream these requirements vary from almost white to a deep egg yellow: In order to meet these requirements for ice cream the following shall be used as a basis of rating on color:

1. Ice cream in order to receive the full rating of five points must be free from specks, unnatural or uneven colors.

2. Ice cream showing dirt specks, unnatural colors or uneven colors shall be cut not exceeding two points according to the degree of the defect.

Package.

B. Ice cream receiving the full rating of five points must be neatly and solidly packed in clean, non-rusty cans and tubs, the cans being provided with parchment paper circles over the top.

Ice cream packed in unclean, rusty cans, or not provided with parchment circles shall be cut not exceeding two points according to the degree of the defect.

With this exposition before you the following are some of the many questions that might be raised and discussed:

1. Is it wise to have a score card based on 100 points as perfect and considering only flavor, body and texture, and color and package for student contest work

Make This Test

We know, as do many of the country's best candy and ice cream makers, how reliable and yet how economical is Atlantic Super-Clarified Gelatine. We want you to know.

Make this test. Let us send you, on memo order, a barrel of Atlantic Super-Clarified Gelatine. Note its clarity—test its high viscosity and purity—note that the price is lower than that charged for gelatines of so-called corresponding grades. Then use five or fifteen pounds in your production. Watch results closely. If it doesn't measure up to our claims for it—if it doesn't satisfy you absolutely—send the unused portion back. We will pay the freight both ways and your test will have cost you nothing.

We believe that you, too, will standardize on Atlantic Super-Clarified Gelatine after this test, as have many of the best candy and ice cream manufacturers.

THE ICE CREAM REVIEW COVERS AMERICA LIKE THE DEW.

and another so-called commercial card considering not only the above items but fat and total solids as well?

In our opinion one complete score card is enough. The need of an ice cream score card for students' judging work is very acute. In these contests students score ice cream on flavor, body and texture and color and package. It seems that there is need for a score in the commercial field especially in educational scoring work. Such a score card undoubtedly should consider food value and a measure of how the ice cream has been produced and handled. While the number of points that should be allotted to flavor, body and texture, and color and package together with the system of grades and standards for same are the most pressing things that need to be decided, there seems to be no good reason why fat and total solids should not be considered on the

same score card. The essential thing to decide is the number of points to be allowed for each item on the score card and then adopt some system of grades as a trial until such time as further experience warrants a change.

2. Should body and texture be considered separately and given separate scores?

The suggestion has been made that body and texture are two different things and that they should be separated. We feel it is so difficult to draw the line on what is meant by body and what by texture that it would lead to confusion to separate them.

3. In the score card suggested are the points apportioned correctly among the different items? Are items mentioned that should not be considered or are there items mentioned that should not mentioned that should be considered?

It seems advisable to allow five points for color and package. These are of relatively minor importance but certainly ice cream in a rusty or unclean container or ice cream of very unnatural color should not receive a perfect score.

It is doubtful if it can be argued that any kind of bacteria even the acid formers are beneficial in ice cream. If this is true ice cream with high bacteria count should not get as high a score as ice cream of low bacteria count. There are those who seem to feel that not enough is known about the bacteriology of ice cream to warrant its consideration on the score card. As the writer sees it, it is simply a question as to whether our bacteriologists know how to accurately sample ice cream and make an accurate bacteria count on the sample.

If bacteriologists can answer this question in the affirmative there is no reason why bacteria count should not receive consideration. If the answer be in the negative, then the time is not ripe to consider bacteria count on the score card. In view of the fact that the American Public Health Association has not published any standard methods of bacterial examination of ice cream it does not seem wise to include bacteria count on the score card. It has been pointed out by Ellenberger¹ of Vermont and Ayres² and Johnson of the Dairy Division that such things as method of preparing sample, whether count is made on weight or volume basis, kind of media used and temperature and period of incubation of plates all affect the bacteria count. It would seem that some one should appoint a committee to work out a definite standard of analysis that all would follow.

A few years ago about the same proposition concerning

Single-Phase Motors

have proved their superiority for operating refrigerating machines, especially the household and ice cream cabinet type, pumps, air compressors, etc., because of their high efficiency and starting torque (over 275% of full load torque); besides the brushes touch the commutator only during the starting period, thus insuring quiet operation and long life to both commutator and brushes.

fronted us in the case of market milk. Bacteria counts were considered unreliable. Would not, including an allowance for bacteria on the score card, help materially to stimulate research along the line of reliability of bacteria counts for ice cream. It is apparent that including bacteria count on the milk score card helped materially to stimulate investigation on standard methods of bacterial analysis for milk. We believe that all are convinced of the importance of including some measuring stick of sanitary quality on the ice cream score card. As a possible suggestion 10 points might be allowed for bacteria count and liberal allowance made as to number permissible before very serious cuts are made in the score. This, of course, would mean taking these points from some one or two of the other factors.

With regard to grades and standard for bacteria it will require a considerable amount of experimental work, as a large number of bacteria counts made according to an approved method on a number of samples of ice cream are essential in deciding this point.

The remaining question is, should more weight be given to flavor and less to body and texture. It is true that most of the large plants have a better control on body and texture than is possible for flavor and most of the ice cream from the large plants is perfect, or nearly so, in body and texture. However, the large number of commercial samples submitted to our educational scorings last winter show all sorts of body defects, and convinces us that the smaller plants, especially, have not solved the problem of turning out ice cream of uniformly good body and texture.

The consumer of ice cream will put up with a flavor that at best might be termed only fair, while coarse, icy or battery ice cream will draw complaint at once. The writers of course feel that more weight should be given to flavor than body and texture, the above statements are made simply to argue the point that 26 points are not much less than that should be allowed for body and texture. Possibly 5 points might be deducted from body and texture and added to the flavor score.

4. Are the flavors properly classified and the cuts allowed for each group what they should be? Are there other off flavors that should be included in any of the classifications?

Standard Is Important.

The matter of the number of points to cut for any defect does not seem so important as some of the previous questions. The important thing is to have some standard to follow and then have everybody stick to it. We have set our lowest flavor score on any ice cream that can be considered salable, from the standpoint of flavor, at 25 points. Ice Cream of such poor flavor as obviously make it unsalable is score 0 on flavor. This seems much better than allowing a range of from 0 to 25 points for the fourth class of flavors as it does away with the element of guess work to a large degree. To illustrate, a sample might be slightly salty but not bad enough to really class it as unsalable. If a free range of from 0 to 25 points was allowed for this defect the judge might score it 10 while the student might score it 20. One guess might be as good as the other. Following our suggestion both judge and student would now the sample must score 25 to 34.6 points. This scheme does not solve the problem of differences in judgment of individuals as to what constitutes a flavor bad enough to make ice cream unsalable nor does there seem any way of solving this problem. However, the matter is not serious, as most ice cream is good enough to eat and if a sample is really bad it is likely to be so bad

as to leave no doubt in the minds of anyone as to its salability.

5. Are body texture defects properly classified? Are there other defects that should be included?

It is not likely that ice cream will have a sufficiently poor body and texture to make it unsalable, hence to avoid too wide a range of cuts for classes 3 defects 15 points is considered the lowest possible score on body.

6. Is 12 per cent of fat and 36 per cent total solids the proper minimum standard for an ice cream considered perfect in these items?

In some parts of the country would this result in a cut in the score for ice cream that might be considered perfect for fat and solids for that locality?

An examination of data on state standards shows that 30 states do not specify higher than 10 per cent of fat for plain vanilla ice cream, while 19 specify less than 10 per cent, four require 12 per cent and eleven require 14 per cent.

It should be remembered that state standards are merely minimum requirements, below which, ice cream cannot legally be sold. Such state requirements should therefore not be considered as expressing the most desirable per cent of fat that ice cream should contain. In the East, competition has raised the fat and total solids content of ice cream to an average of 12 per cent fat and 36 per cent total solids, notwithstanding the fact that the state legal requirements for Connecticut and Massachusetts are 8 and 7 per cent respectively. It is the consensus of opinion of many ice cream men in the East that increasing the butterfat up to 12 per cent has greatly stimulated consumption of ice cream.

That these observations were justified is evidenced by the carefully measured experiments of both the U. S. Department of Agriculture and the Chapin-Sacks Company, as published in the October issue of the Dairy Products Merchandizing. It is in view of these facts that we suggest a 12 per cent fat and 36 per cent total solids in ice cream should receive a perfect score on food value. An 8 per cent fat and 33 per cent total solids ice cream under this scheme would receive a cut of 7 points, or a score of 13 points. To us this seems just. It may strike our Southern friends differently.

7. Should color receive any consideration on the score card and is the maximum cut of 2 points too large or too small?

It is felt that a fairly wide range should be allowed in scoring color of ice cream. The maximum cut of 2 points is intended to apply only to extreme cases where the color is very unnatural for the flavor with which it is used.

NASHVILLE'S NEW PLANT OPENED TO PUBLIC.

The new plant of the Union Ice Cream Company, Nashville, Tenn., was described in the December, 1923, issue of The Ice Cream Review. The company used an entire section of the May 27 issue of the Nashville Banner in describing the opening of the plant and relating some of the history of the plant. Testimonial letters from the firm's dealers were published, and the section, which included sixteen pages, contained advertisements from a number of concerns that took part in the construction of the new plant. A visit to the Union Ice Cream Company's plant is described in one of the items in that section as follows:

A visit through the Union Ice Cream Company, the plant with a sunny atmosphere, is a rare treat to a visitor, especially when piloted by the captains of that real organization. They show the visitor a real plant, operated by real men, and

convince him that they are making a product known as the choicest of the dairymen's art.

The first place one is ushered through is the beautiful, spacious office and there received by men who bespeak the works "we are glad to see you." From there we are conducted through the large shipping room, well lighted, well laid out and convenient in every respect, so that every loss of motion is eliminated; then to the receiving platform where fresh, rich milk and cream is received through the early part of the day and is converted into ice cream mix that day ready for the freezers. One is impressed with the thought that has been given this wonderful plant, the real plant of the South.

As we leave the milk receiving room, we are conducted upstairs to the laboratory, where we are introduced to one of the four servants of the ice cream industry, the first, the Mojonnier fat and solids tester, the machine that stands as the big boss in the plant, telling the ice cream maker exactly how to make his ice cream, the same every day, giving to the customer ice cream which is as near right as human ingenuity can make it. In that laboratory, which is bright and well equipped, the tests are made for factory control all the way through.

From that point, we are conducted to the beautiful and well designed mixing room where we are introduced to the second true servant known as the Mojonnier vacuum pan. The ice cream mix is made under vacuum in this vacuum pan, the very latest development in the ice cream industry, and this is one of the few plants in the country that has gone to the expense of placing machinery of that kind to make their product superior in every respect. From the pan the mix is stored in huge sanitary white enameled tanks and held ready to freeze. From there we are conducted through the large, spacious, well ventilated, well lighted, sanitary freezing room where a beautiful battery of freezers are lined upon a stone platform standing there like a row of sentinels, ready to perform their duty. At the end of this battery stands the third true servant of the industry, the Mojonnier ice cream packaging machine. This machine fills bricks, Sealright packages and individual packages mechanically without the touch of human hands so rapidly that one comes to the conclusion that Mr. Drake knows what he is about. The fourth true servant, known as the Mojonnier overrun tester, stands all lit up between this row of freezers looking like a faithful operator speaking in silent tones to the operator to make every can of ice cream the same.

From there the ice cream is conveyed into the large, spacious hardening room, one seldom equalled in the country, and left to harden and ready to deliver to the customer in perfect shape. Going still further, we are conducted to the compressor and ice cream making department. One is impressed with the wonderful equipment seen in this part of the plant. Massive compressors, and the way they operate night and day, is a credit to the plant.

The building is one of the most beautiful buildings in the industry, and is a treat in itself to see. One cannot help but be impressed by the men showing you their plant. Nothing is too much trouble for them.

The delivery equipment in the way of trucks, and the way they are loaded and deliver the ice cream, without a doubt bespeaks the thought and efforts that have been made by men who know their business, and lastly, the ice cream that is served to the ultimate consumer in the iceless cabinets, the latest of all the dairy developments, will tell any casual observer that officials of the Union Ice Cream Company are right on the job every minute of the day.

The operators in the plant are one of the few in the country who are equipped all around with the four true servants and were one of the first to take hold of these most recent developments in the ice cream industry and manufactured by the Mojonnier Bros. Co. of Chicago, who are making a life study of the scientific control of the ice cream industry.

KANSANS TO MEET IN DECEMBER.

The ice cream manufacturers of Kansas will meet in annual convention December 16, 17 and 18, 1924, at the Hotel Kansas, Topeka, according to recent announcement by B. T. Perkins, secretary of the Kansas Association of Ice Cream Manufacturers. Convention committees and program preparations will be taken up later on, it is announced.

NATIONAL CONVENTION—NEW ORLEANS—NOVEMBER 17-20, 1924.

NOTES OF THE TRADE

News of Interest Concerning What Our Readers and Advertisers are Doing
to Develop the Industry. We Invite Correspondence Relative
to New Products and New Equipment.

THE PFAUDLER COMPANY PURCHASES ELYRIA ENAMELED PRODUCTS COMPANY.

The Pfaudler Co., Rochester, N. Y., announces that it has purchased all of the assets of the Elyria Enameled Products Co. of Elyria, O. The purchase was consummated June 3, 1924.

It is the intention of The Pfaudler Co. to continue operation in the Elyria factory and to continue the production of Elyria equipment. All of the staff of the Elyria Enameled Products Co. have been retained and with bigger production made possible through the operation of both factories, even better and more complete service than heretofore will be given.

The company is rapidly completing plans to place on the market a new line of glass lined piping. Other developments such as a combination of the fine points of the Elyria tank car with those of the Pfaudler tank car are being gone over, so as to give the trade a super-tank car for milk haulage.

It is also announced that the company's European factory, located at Schwetzingen, Baden, Germany, is now operating at full capacity and it is in a position to give direct service to any of its clients having European interests. They will be served from this factory, thus eliminating ocean freights.

Harry S. Calvert, for so many years president and general manager of the Elyria Enameled Products Co., has been elected to the board of directors of The Pfaudler Co., and has been made vice-president in charge of the Elyria Enameled Products division.

The officers of The Pfaudler Co. now are as follows: E. G.

Miner, president; W. D. Pheteplice, vice-president and general manager; H. S. Calvert, vice-president in charge of Elyria Enameled Products division; R. Ranlet, treasurer; C. J. Stothers, secretary, and R. B. Kilmer, general sales manager.

THE NEW COCHRANE INTEGRATING FLOW METER.

In the Cochrane flow meter, according to a description by the manufacturers, the deflecting and actuating member is a U-tube containing mercury and balanced upon a knife edge. Pressures from the two sides of a metering element, such as an orifice or nozzle in a steam line, are led to the two limbs of the U-tube through small, flexible torsion tubes placed close to the axis of rotation of the balance. The pressure differential, set up by flow through the pipe line, forces mercury from one side to the other of the U-tube, causing the latter to tilt. In order that the tilting may be proportional to the rate of flow, the U-tube carries a cam which presses against a metallic ribbon kept taut by a weight. This meter has no working parts inside the pressure chambers and no stuffing box is required, hence there is very little friction.

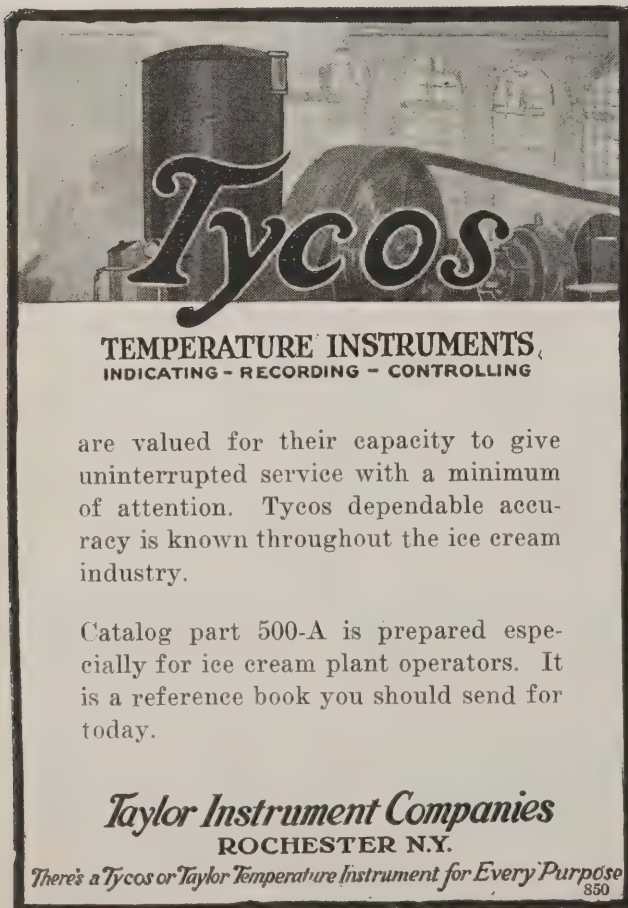

In designing an integrator for use with this flow, it was considered desirable to impose no resistance or load upon the deflecting member in order to retain sensitivity and accuracy, and also to eliminate external variables, such as vibration or voltage fluctuations. These considerations barred the type of integrator in which a roller driving a counter train receives motion from the recorder chart. Not only is such an integrator likely to be deranged when changing charts, but the sliding of the roller edgewise opposes resistance to the movement of the deflecting member and thereby introduces error unless the deflecting member is excessively large and powerful. The latter objection applies also where the roller receives motion from a separate clock-driven disk. It is true that the sliding friction of such a roller can be reduced by placing small transverse rollers around its periphery, but while such rollers decrease the drag, they make it difficult to reproduce the theoretical diameter of the integrator roller, and when the small rollers become clogged with dirt they have about as much friction as would a solid roller, officials say.

The integrator which was finally developed is driven solely by the clock, the deflecting member of the meter merely controlling the position of a stop or motion-limiting pin. In principle, this integrator is similar to the method sometimes used by steam engineers for obtaining the mean effective pressure of an engine indicator card which consists in ruling evenly spaced parallel lines across the chart, adding up the lengths of the lines intercepted between the indicator lines and then dividing by the total number of lines which have been added. By using enough lines, any desired refinement of accuracy may be obtained.

The Cochrane flow meter integrator acts in the same way, according to officials, except that only the total is used, no division being made to obtain an average. That is, the integrator goes through motions equivalent to drawing a line from zero to the pen trace on the flow meter chart once each minute, the length of this line being proportional to the momentary rate of flow and the sum of the lines proportional to the total flow for a definite period.

A little ice cream truck for use in the freezing room is being featured for the first time in this issue. It is manufactured by the Utility Manufacturing Co. of Faribault, Minn. The purpose of this truck is to facilitate the handling and filling of cans at the freezer. It moves on rubber tired casters and the container, which has a capacity of six five-gallon cans, revolves, thereby making it most convenient for the filling of cans. This truck saves considerable time in moving the cream from the freezers to the hardening room, officials of the company claim.

WILLIAM S. CHAMP PASSES.

William S. Champ of Malba, L. I., president of the Cone Company of America, with offices in New York City and Chicago, died on June 2 at the Post Graduate Hospital, New York City. He was widely known in the ice cream industry and his passing from this industry is a source of much regret to many friends, both in the supply as well as in the manufacturing divisions of the industry.

Mr. Champ formerly was president of the American Maize Products Co., and at his death was vice-president of the Realty Trust Company of New York. He was one of the directors of the Royal Baking Powder Co.

The deceased was born in Hamilton, Canada, January 6, 1870. He was a salesman when he attracted the attention of William Ziegler, "baking powder king." Mr. Ziegler made him private secretary and he rendered important assistance in the consolidation of the baking powder interests. After Mr. Ziegler's death, Mr. Champ, at great risk, carried out the wishes of the former's will that Anthony Fiala and the members of his polar expedition be found in the Arctic and brought back. The steamer had been crushed in the ice in the early winter of 1903-4, and the thirty-seven men of the party presumably would have perished had not Mr. Champ, after an initial failure, finally succeeded, in the spring of 1905, in reaching and rescuing all but one.

* * *

VIKING PUMP COMPANY EXPANDS.

Growth of the Canadian sales of the Viking Pump Company, Cedar Falls, Ia., have necessitated the erection of a new plant at Walkerville, Ontario, according to recent announcement. It has a production capacity of 5,000 pumps a year and is to be operated under the direction of J. B. Buyck, manager, and J. C. Petersen, treasurer, formerly of the Cedar Falls factory.

Two new buildings are being erected at the Cedar Falls plant. One is an additional storeroom 40x127 and the other a 2-story office and shipping department 74x148, costing something over \$50,000. George Wyth, president, states his pump sales are steadily increasing each month and at the present time over 50,000 are in use.

See Gifford-Wood advertisement on page 15

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

THE GLACIFER METHOD.

The Ice Cream Review has received a very attractive little circular from the Glacifer Co., Somerville, Mass., in which a number of points in favor of the Glacifer container are brought out. The Glacifer, they say, pays dividends—four and one-half cents on each gallon of ice cream. It is all figured out, the cost of the old method and the Glacifer method, and although the Glacifer containers originally cost twice as much, the cost per gallon is actually reduced from eleven and seven-tenths cents under the old method to seven and one-tenth cents for bulk and seven and seven-tenths cents for brick ice cream under the Glacifer method, the company claims.

An interesting comparison of express rates for different kinds of containers is given on the last page. The circular will be sent free to anyone interested upon request.

* * *

KAPNER HEADS TEXAS BARREL CO.

Charles M. Kapner has been named successor to Jacob Noodelman, as president of the Texas Barrel Co., Houston, according to an announcement late in June. This announcement will be of much interest to friends of the company in the ice cream industry, particularly in the Southern and Western states.

In making this announcement the company refers to Mr. Kapner as a "live, wide-awake gentleman who will prove popular with ice cream men." He has brought about decided results in the short time he has held this post, according to the announcement.

The Texas Barrel Co. manufactures ice cream tubs of all sizes. G. J. Kapner is secretary-treasurer of the firm.

CHARLES M. KAPNER.

* * *

IMPROVEMENTS FOR PENNSYLVANIA FIRM.

The Alfred Ice Cream Company, Ridgway, Pa., has just completed a general remodeling of its plant, making the following additions: 6,000-gallon hardening room, 40-ton ice storage room; a fruit storage room; cream storage room, and new equipment in the mixing room, including two-stage valve on Gaulin homogenizer.

Extensive repairs also have been made at the company's creamery and distributing plant at Brockwayville, Pa. The construction of the refrigerating rooms was under direction of K. W. Schantz, Inc., Buffalo, N. Y.

* * *

NEW ATTACHMENT.

The National Bundle Tyer Co., Blissfield, Mich., has announced a new attachment to its No. 9 bundle tyer machine. It is a new automatic feeder, and, according to the company's description, all that is required is to drop the package on the feeder, and the weight of the bundle trips the feeder and delivers it to the knotter bill in just the required position. The packer puts the required pressure on the package just as it is being tied, it is claimed. The National Bundle Tyer people say the feeder has been tried out and works perfectly, even on very small packages. Ice cream manufacturers are using this machine for the wrapping of brick ice cream, they say.

* * *

CHOCOLATE MANUFACTURERS MEET.

The Association of Cocoa and Chocolate Manufacturers of the United States held its annual meeting at the Hotel Pennsylvania, New York City, on Wednesday, June 4.

The following officers were elected for the ensuing year:

President, H. C. Gallagher, president Walter Baker & Co., Ltd.; vice-president, Wm. F. R. Murrie, president Hershey Chocolate Co.; treasurer, Wm. H. Watt, vice-president Hooton Cocoa Co.

The following were elected to serve on the executive committee, together with the president and vice-president: B. K. Wilbur, vice-president H. O. Wilbur & Sons, Inc.; S. P. Goble, vice-president Rockwood & Co.; Louis Runkel, president Runkel Brothers, Inc.; Wm. K. Wallbridge, vice-president Peter Cailler Kohler Swiss Chocolate Co., Inc.; J. A. Boyle, president Stollwerck Chocolate Co.

Only routine business was transacted. Following the general meeting, the new executive committee met. Wm. K. Wallbridge was re-appointed secretary, and it was voted to continue the existing committees.

* * *

HIGGINS RETIRES FROM MILLIGAN & HIGGINS CO. THOS. J. STEWART REJOINS THAT ORGANIZATION.

Announcement that Thomas J. Stewart, formerly of the C. Nelson Manufacturing Co., St. Louis, has returned to his position with the Milligan & Higgins Gelatine Co., New York, was made last month co-incident with the announcement that the president of this company, Thomas Higgins, who has been in active charge of the business for fifty-six years, has retired "to place the business in younger hands."

THOS. J. STEWART.

Mr. Higgins' announcement follows:
Mr. Thomas Higgins, who has been president and actively engaged in the management of the Milligan & Higgins Gelatine Co. since its organization, recently concluded after reaching four-score years and over, that the time to retire and place the business in younger hands had arrived. He felt confident that the men who had been associated with him from 20 to 40 years and had been carefully trained, had the ability to conduct the business with the same scrupulous honesty of purpose and maintain the same high character and enterprise that had marked this concern for the last 56 years. Consequently, on the 12th of June, he disposed of his interest to these men, and they have taken over the management.

They feel that they are now embarking on a business of their own, and expect to use the utmost care in maintaining the high quality and uniform character of gelatine and to conduct the business with the utmost economy.

Starting in a small way, in 1868, this organization has steadily grown through integrity of purpose and unrivaled service, until it is among the foremost in the industry. The various salesmen will retain their old territory, and give their entire efforts to the trade.

Mr. Joseph Thomas, Jr., vice-president, who has been general manager for the past several years, will retain that position, and continue to supervise the manufacture and the importations.

In connection with this announcement, The Ice Cream Review has received a statement to members of the industry, from Mr. Stewart, who is one of the ice cream supply industry's most widely known members. His statement follows:

It may be surprising to you to learn that the writer has resumed his position with the M. & H. Gelatine Co., and will cover the same old territory, same as heretofore.

Only recently our president, Mr. Thomas Higgins, who has been in active charge of this business since its organization in 1868, decided that after reaching the age, beyond four-score, that the time to retire to a life of rest had arrived, and in looking about, decided that he could happily dispose of this business to those men who had been associated with him from 20 to 40 years, of whom the writer is one, and, consequently, the deal was arranged and closed on June 12th.

We feel that we will be in a position to supply you high quality, pure, wholesome gelatine, adapted to your particular purpose, and that with careful, economical management we will be in position to offer you a uniform supply of choice gelatine, adapted to your work at the lowest prices.

The writer assures you that it will be a great pleasure to gain do business with you, and he appreciates the many years friendship with his trade and hopes for a continuance of your patronage.

With kind personal regards.

Very truly yours,

THOS. J. STEWART.

MEYER DAIRY EQUIPMENT CO. TO OPEN DISTRIBUTING POINT AT DALLAS, TEXAS.

The Meyer Dairy Equipment Co. of St. Louis, Mo., has purchased the dairy supply department of the Huey & Philp Hardware Company of Dallas, Tex., and on August 1 will take over the active management which will be in the hands of men who are well known in the Texas territory, is the announcement of officials of the company.

R. D. Welton, for many years connected with the dairy industry, will be office manager, and W. B. Matthews, who has been with the Huey & Philp Hardware Co. for many years, will be the sales manager for the new company.

The company has a large stock at Birmingham, Ala., which gives them excellent shipping facilities in the entire Southern territory.

* * *

The Horine & Bowey Company of Chicago now is settled in its new, enlarged home at 401-403 West Superior street, and is better equipped than ever before to take care of its rapidly growing business, according to officials. The company has more than doubled its former working space in the new "sun-lite factory," a steel and concrete structure, with unobstructed sunlight on three sides. The entire building is

occupied by the company for the manufacture of "Bowey Brand" fruits, flavors and colors for ice cream manufacturers.

The company is now entering its thirtieth year. Additional expansion is taking place in the advertising and sales forces of the organization. J. W. Hanner is now head of the sales promotional and advertising departments and T. C. Hyland, who for many years has been in the selling end of the fruit and syrup line, recently joined the sales force.

Trade Literature

The J. G. Cherry Co. has just published a new bulletin (No. 2070) in which are shown 15 plant lay-outs illustrating successful methods of grouping and installing equipment in milk plants, ice cream plants and creameries of varying sizes and capacities.

The drawings shown were developed to save floor space and cut down production operations under certain specific conditions.

A copy will be mailed, without obligation, to anyone making request, officials say. In asking for the bulletin, they request readers to mention the bulletin number—2070—and address all inquiries to the Cedar Rapids office.

* * *

A new book on Progress ammonia or direct expansion freezers has just been issued by The Creamery Package Mfg. Company, 61-67 W. Kinzie St., Chicago. Complete description, illustrations of different sizes, units of construction and tables of specifications are given in the book.

This freezer makes it possible to make a delicious cream without using brine, brine box, brine pump, brine lines, or other accessories of the brine system. It is said to be simple

The Mark of Merit

Eliminate Repair Bills!

BY USING

A UNIVERSAL HOMOGENIZER

Built to Keep Upkeep Down!

The universal embodies all the advantages of old time machines in addition to many much needed improvements.

It is so constructed that it will stand up under severest of tests day in and day out—year in and year out—without adjustments or replacement of parts.

Individual cylinders machined from rolled Tobin bronze bars (not cast).

High pressure manifold machined from rolled Tobin bronze having tensil strength of 55,000 pounds.

Individual shimming of cross-head slides maintains correct individual alignment of pistons at all times.

Chrome vanadium steel shafts.

Monel metal pistons not affected by milk acids.

Homogenizing valve—internal spring type—plug and seat are made of an alloy of semi-precious metals so hard it cannot be machined but must be ground with carborundum.

Built in belt or motor drive sizes 200, 400 and 800 gallons.

in operation, requires very little attention and offers a considerable saving in the manufacture of ice cream.

A copy may be obtained free by writing the manufacturers and mentioning The Ice Cream Review.

* * *

"Ice Cream, Carbonated Beverages" is the title of an interesting booklet recently issued by the Warner-Jenkinson Co., St. Louis. In the preface it is described as "a handbook for ice cream makers and students taking short courses in dairying." The book has a short introduction to the study of chemistry and physics. Milk hygiene is the first subject taken up in the chapter captioned "The Ice Cream Industry." Then follows a discussion of "Laboratory Control of Milk Products." Standardization is discussed in the chapter devoted to "Composition of the Mix," and general formulas are given. Other topics are: "Preparation of the Mix," "Freezing," "Bricks and Molds," "Small-Scale Production of Ice Cream," "Frozen Puddings," "Frozen Custards," and "Extracts."

PENNSYLVANIA PLANT OPENED.

The ice cream plant of the Pennsylvania Cone and Baking Co., Uniontown, Pa., was opened June 2, at 22 W. South St. Since then many have taken advantage of the invitation extended by the company to visit their modern ice cream manufacturing plant. The interior of the plant is white enameled, and the newest and most modern machinery has been installed, which enables the company to produce a high-grade product.

A ten-ton Arctic refrigerating plant supplies the necessary refrigeration for freezing and hardening the cream. Mixing vats and freezers of the latest types are in use here.

The officers of the company are J. W. Abraham, president; Robert J. Carter, vice-president; Charles L. Lewellyn, secretary, and Dr. A. C. Howard, treasurer.

Advisability of Carrying More than One Grade of Ice Cream

By W. J. BARRITT*

JUST what motive prompted the program committee to assign this subject to me, I cannot say, and as they did not give any instructions as to which side of the proposition they expected me to take, I take it for granted that it is permissible for me to express my personal views regardless of what they may be.

Therefore I will be perfectly frank in the beginning and say that in my opinion it is extremely inadvisable to carry more than one grade of ice cream. In other words, I am emphatically opposed to it. I am sure, however, it has been the experience of nearly every manufacturer here at some time or other, as it has been mine, to meet with a request from some good customer, or generally it is a new one just starting in, to make a special grade or formula, and it is really wonderful how many good reasons they usually advance for wanting you to do this. They lay great stress on what great results will be obtained in volume of business, if you comply with their request. Of course you naturally reply you are making the best ice cream in the city, selling hundreds of gallons to a well satisfied trade, and that you believe it to be good enough for him or anyone else, but this fellow wants something better, he wants individuality—that's a great word and they always use it. He wants to advertise and boost the ice cream business, and develop more volume over his fountain.

Well, what if he does, just how does it benefit us? Not a particle if he follows the usual method, which

* President, Southern Association of Ice Cream Manufacturers. An address delivered before the convention of the Southern Association of Ice Cream Manufacturers, held at Little Rock, in December, 1923.

would be to put up signs or advertising matter saying, "Our Ice Cream Is Made By Our Own Special Formula;" "Only Pure Cream Used," and all that kind of stuff, every word of which is a direct reflection upon the good reputation you have built up by making a first-class piece of goods, upon which you have spent thousands of dollars in advertising. And if you comply and furnish him with a special grade, the chances are a hundred to one that he'll either go out of business, or what more frequently happens, sell out to some other fellow with another idea, and then you have the same thing all over again. There's no assurance of permanence with the retailer—he can quit when he likes, but your plant is a permanent institution.

If this alone is not sufficient to convince you of the folly of such a practice, let me suggest another reason why we should not carry more than one grade. Many of us have adopted a trade name for our ice cream. We have worked hard to make that name stand for the best in ice cream. Slogans have been used, such as, "The Cream of Creams;" "The Cream By Which All Others Are Judged," and hundreds of others too numerous to mention. How can we reconcile these advertised statements with an attempt to make several grades under the same trade name? Here's an example of how it would work out: Smith down the street is serving your regular cream and in comes a little party of customers. They give their order and are served. Perhaps one of them happened to have been up to Jones' last night, who is selling this "special grade" you are making for him. He notices the difference and begins to comment on how much better Jones' cream is than Smith's, and then your trouble begins. You are selling both under your advertised trade name and the idea gets started that you are making several grades. Immediately you are put on the defensive, and all the explaining you can do to Smith about how much more Jones is paying for his ice cream will not offset the germ of suspicion and jealousy that has been planted in his mind.

Therefore I contend that you cannot possibly make several grades of ice cream without first jeopardizing your trade name and good reputation, the very foundation of your business, and second, the friendship and good will of your trade which is just as essential to your welfare and future growth.

Another point against carrying several grades is the inconvenience and expense. All of us know how

Hardening Rooms

NO matter how good your mix or how modern your freezer, you cannot successfully market ice cream unless it is properly hardened.

ST. LOUIS, MO.

even the carrying of too many flavors is in itself a problem, and many times a hardship. What then would be the case if we carry more than one grade? It is my firm belief that no argument in favor of several grades can be advanced that will stand.

If we were like some of our extract friends, it might be different, but I even question that statement sometimes when I am offered a dozen grades of a product by the same firm, to fit a price. I am beginning to believe it would be better for them to offer one grade, backed by their reputation as to its quality and value. There is some justification for different grades perhaps in these products because we manufacturers can test out what we buy and see if we are getting the results in the finished product, but who is going to be the judge of your ice cream and make the test? The public or consumer, and imagination has a great deal to do with the public's opinion of ice cream, and if they become suspicious of the quality, no amount of advertising or argument can replace their lost confidence in their favorite brand.

Our business and product is so different from any other, that I believe we cannot afford to experiment with carrying different grades.

Personally, from the standpoint of competition, I would want no better opportunity than would be presented to me if one of my competitors should adopt the idea of carrying several grades. I would simply announce that I had one better than the best of my competitors, and then deliver the goods, and you know who would get the business.

Gentlemen, I have expressed only my personal convictions in this matter, based upon my own experience, for if you will pardon the personal reference, I will add that down in the section where I operate we adopted a trade name upon which we have spent a large sum for advertising in the past twelve years, and we have backed up our advertising with one grade of ice cream, and I defy anyone to go into that territory, and find that our trade name is not known to stand for the best that can be had. Therefore I know, that one grade, backed by the best service you can render, will win out, because it has proved so with me.

FROZEN FRUIT MANUFACTURED IN NEW ENGLAND.

Frozen fruit is a new product now being manufactured by a New England manufacturer. It is reported to be making a favorable impression upon the public. The product consists of fruit entirely with some form of binder. It is unnecessary to put the mixture through the freezers, it merely being packed and placed in the hardening room. Then it is cut, dipped into chocolate and wrapped in foil, being put up much in the manner of the well-known Eskimo pie. It is said to make a very appetizing and wholesome tidbit. It is possible for a variety of flavors and colors to be used for the coating.

ICE CREAM FOR AUSTRIANS.

American ice cream is to be introduced in Austria, according to press dispatches from that country. Assistant Trade Commissioner E. M. Zwickel states that if Austria's milk production were greatly encouraged, the country could produce its own requirements of milk and milk products, but is spending large sums on the importation of dairy products. It has been proposed to establish cheap booths in the parks where Austrian children can buy American ice cream.

SOUTHERN CONVENTION—NEW ORLEANS, NOVEMBER 14-15, 1924.

Hundreds of Plants Use Them

The quickest, simplest way to handle your "empties" is provided by this Nutting truck. It saves many hours every week by speeding up can handling and moving.

Dirty cans are piled with open end out and slant upward to keep contents from spilling. Washed cans are piled with open ends in and slant down for quick draining. They are counted automatically and always ready to go. Top railing holds all covers.

Note these features. Built of structural steel. Heavily braced and riveted. Entire frame is galvanized. Large main wheels; ball bearing casters. Flat faces of wheels and casters save floors.

New low price. Fig. 106 (30x66 in.) Top rail included. \$52⁰⁰
F. O. B. Faribault or Chicago.

News From Far and Near

CALIFORNIA

FLORIDA

Fayetteville, Ark.—Crystal Ice Cream Co. will erect a \$75,000 plant on North West St. Latest equipment for manufacture of ice and ice cream will be installed, including oil engines and motors.

Savannah, Ga.—R. L. Thompson is manager of the recently organized Thompson's Ice Cream Co. on 245 Lincoln Street.

Waycross, Ga.—An ice cream plant is in operation here now. Harry Phelps is manufacturing manager.

DuQuoin, Ill.—The Metropolis Ice Cream and Bottling Co. was recently incorporated with a capital of \$40,000. Incorporators are R. Kunz, A. Lehn and W. R. Hayes.

Anthony, Kans.—A new freezer, which brings the capacity of their plant to 1,100 gallons of ice cream a day, has been installed in the Underwood Creamery and makes the local concern one of the best equipped plants in the state. The new freezer is a Dreadnaught brine freezer and holds sixteen gallons of cream.

Osborne, Kans.—Sutton & Phillips, proprietors of the Bon Ton, have established their own ice cream factory and are turning out a fine product. They have installed a Century electric drive freezer and ice crusher, and have installed an ice cream packer with all the necessary paraphernalia for making ice cream.

Glasgow, Ky.—Brown Bros., formerly of Elizabethtown, are installing a complete ice cream factory here.

Princeton, Me.—The ice cream factory and machinery here, conducted by Delmont Tozier, was destroyed by fire recently. The loss is estimated at \$5,000, partly covered by insurance.

Petoskey, Mich.—The Petoskey Ice Cream Co. has been incorporated with E. S. Martin as president.

Kearney, Neb.—The Kearney creamery, under the management of B. F. Bowersox, is now equipped to make all of the ice cream for the Ravenna Creamery Company, and will

supply all of the territory directly from Kearney. New equipment has been installed and the capacity of the plant has been brought up to one thousand gallons a day.

Atlantic City, N. J.—The Atlantic City Candy Shop has removed its ice cream factory to 3114 Atlantic Avenue (Chelsea section) on account of growth of business. A retail store, however, is still maintained at 1440 Atlantic Avenue.

Jersey City, N. J.—American Ice Cream Co., 955 Westside Avenue, has installed a new machine for dipping and wrapping chocolate-coated ice cream bars.

Somerville, N. J.—John Botti has taken over the ice cream business of Harry Viswab, at 96 West Main street. He will continue to manufacture his own ice cream.

Trenton, N. J.—Charles W. Schmidt has installed a new freezer, horizontal type, 80-quart capacity.

Rochester, N. Y.—The Bartholomay Company, Inc., has added another truck for delivering their Heathized ice cream. The special refrigerating body was built by Anheuser-Busch, Inc., of St. Louis.

Honesdale, Pa.—The Gammell & Kimble Ice Cream Co. is adding an ammonia compressor and hardening room. This will eliminate the use of ice.

Simpson, Pa.—The Mulholland Ice Cream Co. was recently organized by Thomas Mulholland, 520 Belmont St., with capital stock of \$100,000.

Waynesboro, Pa.—The Imperial Ice Cream Co., with headquarters in Huntington, W. Va., recently opened a branch plant here. A. E. Beall will be in charge of the Waynesboro branch.

Union, S. C.—The Chero-Cola Bottling Co. has completed installation of 300 gallons a day ice cream plant.

Memphis, Tenn.—L. Colletta is manager of the newly organized Poplar Ice Cream Co., 806 Poplar Ave.

Electra, Tex.—J. M. Frazier and Paul George recently announced the opening of the new Electra Quality Ice Cream Company.

Cisco, Tex.—The Banner Ice Cream Co., which operates plants at Ranger and Breckenridge, is installing a plant here on West 4th and Ave. E. New equipment has been installed at a cost of more than \$5,000.

Vancouver, Wash.—The Maid O'Wauna Ice Cream Company will construct a \$15,000 building at 20th and Main Sts.

Dresser Junction, Wis.—The Sterling Ice Cream Co. recently added modern equipment which will enable the company to produce 1,000 gallons daily. G. M. Nelson is owner of this plant, which is the only ice cream plant in Polk County.

Ladysmith, Wis.—Lep Schoepf has sold his interest in the Ladysmith Ice Cream Co. to Jim Moore.

DEALERS ENTERTAINED.

The Olympic-Victory Ice Cream Company, Tacoma, Wash., recently was host to more than 500 dealers and their wives at an informal "get-together" at the new sanitary plant at 613-15-17 East 25th St.

A. Robbins, president and general manager, conducted his guests in a formal inspection of the plant, after which the evening was given to dancing and merrymaking in the big social hall of the plant, which was appropriately decorated.

When the chocolate-coated bar first was put on the market, it was the subject of considerable discussion at a meeting of wholesale confectioners one evening. A gentleman named Hirschberg kept asking questions. He suddenly explained his interest by saying:

"Just t'ink how interestin' it'll be for me, a Jew, to get that contract an' sell an Irish retailer Eskimo pie, a product made near the North Pole. Golly, how cosmopolitan this countrying is gettin'."

THE priceless ingredient of any product is the honor and integrity of its maker. If you can depend on the reliability of the House from which you buy, you can be assured of satisfaction.

Into the composition of DERYCOTE Tub and Can Enamel, The National Paint & Varnish Co., has put that dependability and reputation achieved from twenty-one years of satisfactory service, and distribution of "paints for specific purposes."

has given satisfaction because of our desire to live up to our reputation and give you the BEST that years of experience and research can possibly give.

You can soon learn why DERYCOTE does please. Try it yourself.

You can't make money giving 102c for a Dollar \$

Patented

Let the
Weibatch
measure your
mix to Freezer
100%
Accurate

Every pint of mix in your pipe line represents real dollars and cents. When your freezer man pulls mix for a 40 quart batch and throws in a pint for good luck, he practically hands out 102c for a dollar.

The extra pint represents $2\frac{1}{2}\%$ of the batch pulled, while the 40 quart freezer was designed to give the maximum yield for a "DEFINITE" quantity of mix.

Weibatch Pulls Every Batch by Weight

You can't check out with your raw ingredients by buying them by weight and drawing them out by liquid measure.

Each and every batch pulled by Weibatch is exactly the same by weight. Each batch is automatically recorded and gives an *exact* record of the amount of mix ACTUALLY drawn down.

Furthermore — Weibatch insures uniformity. Measuring out flavors in small amounts leaves little chance for variation, but adding a definite quantity of flavor to an every varying sized batch of mix can not result in uniformity of flavor. Neither does a varying sized batch of mix produce uniform quality of ice cream.

Put Your Freezing on a Business Basis. It costs nothing to convince yourself of the benefit of a Weibatch. Sold under a 30 day guarantee trial. Price on request.

Weibatch Liquid Scale Co.

Grand Rapids, Michigan

MOST ECONOMICAL OF ECONOMY CABINETS

This **ECONOMY CORKBOARD CABINET** has created a sensation among the **ICE CREAM MANUFACTURERS** who have come to realize that superior insulation means money saved in ice consumption.

In addition to having superior insulation this cabinet has a tapered trough, conserving the ice and at the same time giving more insulation where the brine accumulates. This cabinet is equipped with cylinders, making it easy to replace a can of cream at any time.

Every **MANUFACTURER** owes it to himself to give this cabinet a thorough trial. Place your order now, increase your sales, by having your ice cream kept in the best condition with the least possible ice consumption, and **INCREASE YOUR PROFITS.**

This tapered cabinet has an average of 3" corkboard on the side and 4" on the bottom, lined on both sides by water-proofing paper. Equipped with $\frac{7}{8}$ " buffer board to protect bottom of cabinet, making a cabinet that is far superior to ordinary styles.

Tub Cabinets. This separate compartment is especially designed for rural trade, as one compartment alone can be used without being compelled to ice the entire cabinet. The tubs of the cabinets are especially treated to prevent leakage.

Dry Package Cabinets. Most efficient dispenser of Brick carton, dry bulk package, or Eskimo Pies. Each package goes to the customer in perfect condition, having had superior refrigeration in a container totally surrounded by ice, in a cabinet heavily insulated with cork.

Homer Manufacturing Co., Homer City, Penna.

Ice Cream Carbonated Beverages

Price, \$2.00

Written and Published by the
Warner-Jenkinson Co.
ST. LOUIS

A complete treatise, written in the fewest possible words covering ice-cream making in all its phases. No ice-cream maker can afford to be without a copy. The following subjects, among others, are amply covered:

- Composition of milk and cream.*
- Standardization of the mix.*
- Standardized formulas.*
- Simplified methods of calculating any mix.*
- Laboratory testing methods.*
- Bacterial count.*
- Nature of Vanilla Extracts.*
- Certified Food Colors.*

A copy of this work will be mailed free to any customer on our books who applies for one. Any ice-cream maker not listed as a customer can obtain a free copy by sending in the following coupon (trial order) with money order for any *one* of the items specified.

If you do not require any goods, send us \$2.00 for our book anyway and if you do not think it worth the money, mail it back in five days and we will refund.

To the Warner-Jenkinson Co.,
St. Louis.

(Mark with a cross item or items desired)

Please express prepaid:

CP HOMOGENIZER

The CP Homogenizer is a heavy duty, efficient machine. Its present low price is due to economies in manufacture in our Derby, Conn. plant—one of the best equipped machine shops in the country—and to our desire for small profits and large sales.

The CP Homogenizer is equipped with a spring homogenizing valve made of Stellite—one of the hardest metals known. This machine will homogenize at a pressure of 2500 lbs. or more to the square inch, and maintain steady pressures. It is equipped with a safety relief valve as a safeguard against excessive pressures.

CP Homogenizers can be obtained in all standard sizes, equipped with either belt or motor drive. Please write for low prices on all sizes and big descriptive bulletin.

STOP

Replacing Plugs in Cabinet Drains

THE IMPROVED

Smith & Mann

— ONE PIECE —

Cabinet Valve

The cost of replacing lost or stolen cabinet drain plugs many times doubles the original cost of the cabinet drain. Save this needless expense by installing Smith & Mann Improved One-Piece Cabinet Drains with Security Plugs.

This Smith & Mann plug can not screw out or accidentally drop out and become lost. Neither can it be pulled out unless one knows how. The unique design and special "security" washer keeps the plug snugly in place while the large opening is not restricted in drainage.

Made of Non-Corrosive Metal and cast in one piece, Smith & Mann Cabinet drains are easily installed in cabinets and securely fastened against theft by a sturdy lock nut on the inside. Leather gasket on inside cabinet wall insures a leak-proof fit.

Order your supply now and save expense of plug renewals.

Be sure and give thickness of Cabinet Wall when ordering.

Fully patented. All infringements will be prosecuted.

DAIRYMEN'S LEAGUE INSTALLS FIRST PORTABLE MILK RECEIVING STATION

Pfaudler Equipped, of course /

MR. HARRY SIECK, Chief Engineer, of the Dairymen's League Co-operative Association, New York, N. Y., has designed the first portable milk receiving plant. It is now being operated with very satisfactory results at Hankins, N. Y.

The idea of the portable plant (comprising two refrigerator cars) is to take care of emergency conditions throughout the League's territory. If one of their country plants should burn, a break-down unexpectedly occur, or in fact any necessity arise which would call for the sudden diversion of milk—the portable station is drawn by locomotive to the place where the emergency exists, and handling goes on as if nothing had happened.

One car in the unit is the power plant, having facilities for producing its own refrigeration. There is also a high-pressure boiler for heating water and generating steam used in can-washing. The car contains a compressed air unit for agitating the milk.

The other car in the unit is the receiving station, proper. The farmer delivers his milk at the door, it is weighed, is pumped through an internal tube cooler, and finally arrives at the main storage unit of the system—a Pfaudler glass lined tank with a capacity of 600 gallons (shown on opposite page).

EFFECTIVE IMMEDIATELY

An Announcement To The Trade

THE PFAUDLER CO. announces that it has purchased all of the assets of The Elyria Enameled Products Co., of Elyria, Ohio. The purchase was consummated June 3, 1924, and it is the intention of The Pfaudler Co. to continue operation in the Elyria factory, which will be known as the Elyria Enameled Products Division. The production of Elyria equipment will be continued, and all of the staff of the Elyria Co. have been retained. With bigger production made possible through the operation of both factories, even better and more complete service than heretofore, will be given.

Why Let Water-Ice Profits Literally Melt Away?

Make dependable, profitable water-ices and sherbets. Pack and repack them without change — this better way.

IF your water-ices and sherbets were as dependable as ice cream, think of the new markets you could open up—think of the additional profits that would be yours. An enormous demand is waiting, limited only by the production of dependable products. Now you can supply this demand—and *very profitably*. Textor makes it possible.

Heretofore packing and repacking were impossible. Separation of the ingredients of water-ices and sherbets took place; a scratchy mass of ice crystals formed, flavorless and streaky at the top, syrupy at the bottom. This limited the development of a rich market and thus profits were lost.

Now, however, we have overcome these difficulties. With TEXTOR your water-ices and sherbets can be repacked repeatedly and still retain their even texture, uniform coloring and delicious flavor. Ship them long distances if you wish with confidence, for TEXTOR binds the ingredients into a homogeneous combination—it makes *your products dependable and profitable*—it opens the way to new opportunities.

Try Textor
—The Perfect Stabilizer

Cash in on the tremendous demand for dependable water-ices and sherbets. We'll send you a 60 lb. drum of Textor with complete instructions and recipes. Make better water-ices the Textor way. Write us today.

NOW ice cream comes into its own, as warm weather calls for cool refreshments. And now the *Advertised Special* makes its importance doubly felt. Frequent specials, well selected, well made and well advertised get the public patronage for manufacturers and dealers who offer them. How the Citrus Products Company makes such specials and such advertising, available to you without added cost, the following page explains in detail

Kist

The following report is from a town of only about 15,000 population; draw your own conclusions:

*"Mr. J— of the P— Ice Cream Company was greatly pleased with results of the March advertising Service. His first newspaper ad sold 200 bricks of Kist Flavored Ice Cream. His third week, the March 22nd Special sold 500 bricks—or an increase of 150% in two weeks."

*Full name on request.

—and we provide you with formulas for Specials **PROVEN** most popular, with advertisements and dealer posterettes **FREE**.

THE example cited above is only one of innumerable proofs of the value of "Kist" Specials and "Kist" Service Advertising. First of all, it shows how the advertising *sells* the ice cream; and then it demonstrates that the flavors are so excellent that they *increase* sales as their deliciousness becomes known. Another manufacturer* writes—"So far during the month we have increased our Brick Business over 100%."

No alert ice cream manufacturer can afford to overlook the unprecedented proposition the Citrus Products Company is offering. None can afford to hesitate a *day* in investigating. For the big ice

cream season is upon us—and the manufacturer of specials well selected, well made and well advertised is going to get the lion's share of that business in his territory. If you don't believe it, look into the methods of the most successful manufacturers in the business.

Each element necessary to sweepingly successful Special manufacture, advertising and merchandising, the Citrus Products Company is prepared to furnish *free of charge* to users of the incomparable "Kist" fruit flavors.

A copy of the current issue of our "Kist" Business Builder (circulated monthly among our customers) will explain our whole proposition to you. Get a copy—just use the Coupon.

Citrus Products Company, *Ice Cream Division*, 54 E. Kinzie St., Chicago, Ill.

ICE CREAM AS A DESSERT APPEALS MOST TO THE MORE REFINED TASTES. SUCH TASTES ARE FASTIDIOUS ABOUT ICE CREAM FLAVORS—AND THAT IS WHY KIST FRUIT FLAVORS POPULARIZE ANY BRAND OF ICE CREAM.

KIST

“SPECIALS”—timely, appetizing selections of flavors and combinations of flavors—have become a necessity in ice cream merchandising. To satisfy the demands of the great Home market, dealers *must* offer specials, and manufacturers must supply them. Formulas for the most delightful specials, artfully selected, are furnished gratis to customers of the Citrus Products Company—together with an unprecedented free advertising service. For full particulars, see next page.

1 qt. Citric Acid Solution

"Strawberry-Kist" Ice Cream

5 gals. of your regular Ice Cream
Mix, without Vanilla
2 qts. Crushed Strawberries
1 qt. Strawberry-Kist Ice Cream
Compound

*This is the soundest plan
for ice cream manufacturers
that I have ever known —*

Eric Scudder

When I took over the principal ownership and active management of Citrus Products Company six months ago, I soon learned that the Ice Cream Division of this Company had earned its standing as the leading manufacturer of fruit flavors in the country, absolutely on merit of its product and strict adherence to good business principles.

Charles A. Achelpohl, who is largely responsible for the success of this branch of the business, has been elected Vice President of this Company and continues in charge of the Ice Cream Division. Together, we have developed the soundest plan for increasing the gallonage of ice cream manufacturers that has ever been offered. This is not a prophecy—it is a fact—read these letters and remember we have received many more from leading manufacturers all over the country.

More than fifteen hundred leading ice cream manufacturers are using Kist Fruit Flavors today and selling more gallonage for two very good reasons.

Kist Fruit Flavors enable them to make better ice cream, ices and sherbets—in eight delightful flavors—Orange Kist, Lemon Kist, Lime Kist, Cherry Kist, Grape Kist, Strawberry Kist, Raspberry Kist, Pineapple Kist.

Kist Monthly Service gives them better formulas for a special brick and bulk every week and supplies a complete sales and advertising plan to sell these specials for them.

Write us for a copy of The Kist Business Builder, issued once a month and see for yourself how a complete service from mix to sales can simplify your problem of selling greater gallonage. Your territory may be open. Fill in the coupon and mail it today!

Not necessary to add color.

"Orange-Kist" Compound has sufficient color in it. Mix and freeze in the usual way.

Orange Kist
Ice Cream

Sedalia, Missouri

"Kist" Flavors... are absolutely the best we have ever used.

Weber Ice Cream Co. of Sedalia.

Brookville, Pa.

Combining "Kist" flavors with the advertising plan I believe we can build a record business. Brookville Ice Cream & Dairy Co.

Green Bay, Wis.

Intend to start with your flavors on March 8th, and continue each month.

Green Bay Ice Cream & Dairy Co.

Troy, Pa.

I think your advertising plan for the coming year is fine.

Cole Ice Cream Co.

Lawton, Oklahoma

We have had good success with your products in the past and expect to increase it this year.

Lawton Ice Cream Co.

Manistique, Michigan

Your proposition sounds good to us.

Manistique Dairy Products Co.

A Handsome Installation of Progress Freezers

In the Plant of the Globe Ice Cream Co.

THE Globe Ice Cream Co. plant at Los Angeles, Calif., is one of the handsomest plants in the entire country and one of the most modern. The Progress Brine Freezer was chosen as standard in competitive tests, owing to its attractive appearance and unusual efficiency. Seven Progress Freezers are now in use in this plant.

Their glistening nickel plated cylinders and compactness intrigue the eyes of all observers. Among the improved features of Progress Brine Freezers are the squirrel cage dasher with sectional scraper blades, patented brine circulating coil and spiral cut spur type gears enclosed in an oil tight gear box. Please write for descriptive bulletin. Address
